SILK, Artificial. For many years manufacturers sought to produce a material which could be used as a substitute for silk. At the Paris Exposition in 1889 the Comte de Chardonnet exhibited a fibre having characteristics of true silk. This fibre was produced from cellulose of either cotton or pulp of soft woods, and after going through several processes could be spun and dyed like natural silk thread. Many other experimenters and inventors followed improving and modifying the Chardonnet method. Artificial silk is not so soft to the touch as true silk, nor has it the strength or elasticity. It is used largely for dress trimmings, hosiery, cheap ribbons and upholstery; also for insulating electric wires and in the manufacture of incandescent mantles. It is claimed that Joseph Wilson Swann (q.v.) was the first one to attempt the production of artificial silk on a commercial scale. The consumption of this material in the United States in 1918 amounted to 5,801,221 pounds as compared to 4,683,543 pounds in 1915.

SILK AND THE SILK INDUSTRY. In this article it is proposed to trace briefly the history of the manufacture of silk, which has been throughout all the past an article of luxury, and which as late as the 3d century of our era commanded a price so great as to be beyond an emperor's wealth to purchase for his empress; but in our day has come to be within the means and ability of the great masses of our people, and a necessity instead of a luxury.

1. **History.**—Chinese appear to be the first people who applied themselves to sericulture, although some claim for the Tussur silk of India the earliest silk fibre used. The words *Seres* used by Theophanes and *Serinda* by Procopius were in all probability so used to indicate that part of the East, which was no doubt China, where the silk industry existed at a very remote period. Ptolemy was the first to use the word *Seres* for China, or rather the northern part of it, known later as Cathay; and the name is derived from the Chinese name of the silkworm, *sze*, *see* or *si*, in Korean *sir*, whence the Greek *σῆρ*, the silkworm; *σῆρες* the people who furnished silk; and *σινδών* silk. The Latin *sericum* has been traced direct to the Mongol *Sirkeh*; and the *Serikoth* of Isaiah, xix, 9, has been supposed to be silk. From *sericum* is derived the French *soie*, and etymologically connected with it are the German *seide*, Anglo-Saxon *seolc* and English *silk*. Hawae-nan-tze informs us, in a Chinese work

called the 'Silkworm Classic,' that Se-ling-shi, the principal queen of Hwang-te (2640 B.C.), was the first to rear silkworms, and the Emperor Hwang-te was induced to make robes and garments from this circumstance. The Chinese historians carry back the cultivation of the mulberry and the breeding of silkworms to the mythic period. If they are to be believed, the art of silk-reeling was known in China in the time of Foh-hi, a century before the date traditionally assigned to the biblical deluge, and Hwang-te's queen did not disdain to share in the labors attending the care of the insect, as well as in those of the loom, the invention of which seems to be attributed to her and to have raised her to the position of a tutelary genius with special altars of her own. But whatever the precise date of the discovery, there can be no question of the very high antiquity of the knowledge of the worm and its product in China. A series of imperial edicts and voluminous literature of practical treatises testify to the importance of the industry and the care that was taken to foster an art which was considered, according to M. de Rosny, "best fitted to promote the morality of the people and extinguish pauperism in the empire." The wives of the nobles through successive generations personally attended to the rearing of the silkworms. That this silk was of the mulberry-fed kind is evident from a further extract from the 'Silkworm Classic' which says that afterward "When Yu regulated the waters (2200 B.C.) mention is made, in his work on the tribute, of the land adapted for the mulberry tree having been supplied with silkworms, from which time the advantage thereof gradually increased." It is not known whether silk was utilized in India at so early a period as this; but that India learned the art from China is generally believed, although at what period is not known. Aristotle is the first Occidental to give a description of the silkworm, speaking of it as a horned insect, which passed through successive transformations and produced *hombykia*. Four hundred years later Pliny described the silkworm, but he knew nothing of its connection with the production of silk, which, he affirmed, was a woolly substance, combed from the leaves of trees and spun by the *Seres*. For 1,200 or 1,500 years after silk fabrics had become known in western Asia and eastern Europe, the prevalent opinion was, that it was either a fleece which grew upon a tree (thus confounding it with cotton), or the fibre from

the inner bark of some tree or shrub; while some, deceived by the glossy and silky fibres of the seed vessels of the *Asclepias Syriaca* (milk-weed), and of the silk-cotton tree (*Bombax*) believed it was the product of one or the other of these. A few had come so near the truth as to conjecture that it was spun by a spider or beetle. So carefully did the Orientals keep their secret that it was not exposed until the 6th century after Christ, when two Nestorian monks, who had been engaged in missionary labors in China, solved the mystery, by bringing to Constantinople a small quantity of silkworm eggs, concealed in the hollow of their palmer staves. The missionaries had observed in China the various processes connected with the rearing of silkworms, the nature of the trees on which they fed, and the preparation of the silk. This occurred in 552 in the reign of Justinian, who gave every encouragement to the introduction of the valuable insect. At the proper season the eggs were hatched and the caterpillars were fed on the leaves of the wild mulberry tree. The monks continued to superintend at Constantinople the rearing of the insects and the whole process of manufacturing the silk. This knowledge, thus made public, soon spread over the world and though the vast production of silk by the Chinese was not diminished, that of Europe and western Asia was greatly developed in the centuries that followed. Before the introduction of the silkworm in the West and while its culture still remained a Chinese secret the cities of Greece and Syria were compelled to pay so high a price for silk that their fabrics were sold ounce for ounce for their weight in gold.

From Constantinople sericulture spread over the Balkans and the looms of Constantinople, Athens, Thebes, Corinth, etc., were kept busy with the product. The Byzantine silk fabrics became famous and was much used for ecclesiastical purposes, vestments, etc. The Byzantine looms declined in the 8th and 9th centuries, but those of Thebes and other Grecian cities, as also of Syria increased their production and improved their methods of manufacture. The Greeks maintained their supremacy until the fall of the Eastern Empire in the 12th century; but the Arabs and Saracen princes carried their knowledge of the manufacture into northern Africa, Spain and Portugal and to Sicily. The production of Spain and Sicily was very considerable as early as the 11th century, and when the Normans conquered Sicily a century later they encouraged the silk industry. King Roger, first Norman king of Sicily, in 1146 invaded Greece and took captive a large number of silk-weavers whom he constrained to settle in Palermo and Calabria and to teach his people the Greek methods of silk culture. Venice and Genoa followed Roger's example in the 13th century. Other cities took up the new manufacture and Italy acquired a prominence in the industry which she has never wholly relinquished. About the 13th century silk began to be manufactured in France at Tours and later at Lyons. Not until 1494, however, did France engage successfully as a producer of cocoons. Successive rulers of France encouraged the industry but the revocation of the Edict of Nantes was a severe blow as it exiled about 400,000 Huguenots, most of whom were silk-workers. It was long before France

recovered her lost prestige and then it was again wrecked at the Revolution. Under Napoleon I and the Bourbons a stringent tariff did much for the industry in France. The exiled Huguenots tried sericulture in England but without success until 1718 when a new method of throwing was introduced. The manufacture then received a new impulse and English silks replaced the French in the European markets. The English industry was ruined by the commercial treaty of 1860 which admitted French silks duty free. Switzerland and Germany also became competitors of France and are largely engaged in the manufacture of silk. Belgium and Holland have for several centuries engaged in silk production and the velvets and satins of Flanders are quite as old and of as good quality as those of the Italian cities. The manufactured silks of China, Japan and India have a character of their own and for some purposes are in demand. For raw silk production 1913-19 see table on page 6.

2. History of the Industry in the United States.—According to Chinese records the filament produced by the silkworm was first successfully woven by Si-ling-Chi, empress of China, in 2700 B.C., but it was not until the 6th century that the art of making silk was introduced in Europe. In 1609 James I brought the silkworm and the mulberry tree into England and shortly after this the company of Virginia was formed by a group of Englishmen to promote the silk industry in the colonies of America.

The first expedition sent to America met with disaster. Four years later a more successful beginning was made. Influenced by the Crown the Colonial legislatures passed an act requiring 10 mulberry trees to be planted on every hundred acres. There was a fine for neglect of this duty and a premium for every pound of silk produced. But the most strenuous effort amounted to little. With the ascension of a new king to the British throne in 1666 all acts giving bounties for silk or requiring mulberry trees to be planted in Virginia were repealed, and an interlude occurred in sericulture until the last years of the century when several French Huguenots settled in South Carolina. These were skilled silk workmen and they were in earnest in their endeavor to cultivate it in profitable quantities. At about the same time another colony was formed in the same province which was known for more than a century by the name of Silk Hope.

During the first 35 years of the 18th century the silk industry was also introduced into Louisiana and Georgia. Silk culture by the colonists, however, had a fitful and uncertain existence. From 1750 to 1772 the period of its greatest activity before the Revolution, the export of raw silk averaged only 500 pounds per annum, and rarely exceeded 1,000 pounds in a single year.

For many years after the Revolutionary War premiums and bounties for planting mulberry trees and for producing raw silk were authorized by a number of the States. In December 1825 the subject of silk culture received national attention, a resolution being introduced and referred to the committee on agriculture. This committee reported favorably and directed the Secretary of the Treasury to prepare a manual on the growth and manufac-

ture of silk. Inquiries for information on the subject were sent out by the Secretary, Mr. Richard Rush, in 1826, and from the replies and other material received a manual was compiled, entitled "Letter from the Secretary of the Treasury." Six thousand copies were printed by order of Congress. This document contained 220 pages besides illustrations of machinery.

Such favorable action and the publication by Congress at many subsequent sessions of other documents relating to silk culture, together with the serious consideration of the subject by the congressional committee on manufacture and the committee on agriculture, enlisted general attention. Sericulture gained the public ear. Legislatures of several States passed bills for its encouragement and a most determined effort was made to place silk-growing on a paying basis. Silk conventions were held in Maryland, New Jersey, New York and Connecticut. All efforts failed, however, to make sericulture popular in this country. The Amer-

manufacture was conducted in the vicinity of Paterson, N. J., a mill town within easy access of the New York markets, which has grown to be the leading silk-producing city of the United States. Other advantageous centres were found in the coal fields of Pennsylvania where fuel was cheap, and this State now produces more manufactured silk than any other State in the Union. The sewing-silk and floss industry has always been confined chiefly to the New England States. In 1860 without the protection of a high tariff the total production of the industry amounted to \$6,600,000. At that time importations of manufactured silk were valued at \$3,300,000. These have remained nearly constant. The production figures have, however, grown in tremendous proportions and in 1914 reached a total of \$254,000,000, while the number of employees rose from 5,000 to 108,000. The following tables of the imports of raw silk, waste silk and cocoons for the years 1914-18 will serve to show the amount of raw material now being consumed by the industry:

SILK IMPORTS INTO THE UNITED STATES OF AMERICA.

(Reported by the Department of Commerce, Washington, D. C. Foreign Invoice Values Only).

	1917-1918		1916-1917		1915-1916		1914-1915	
	Weight	Value	Weight	Value	Weight	Value	Weight	Value
	Pounds	Dollars	Pounds	Dollars	Pounds	Dollars	Pounds	Dollars

ican producer could not compete with the cheap labor of the Orient and Europe, and other lines of industry afforded greater remuneration. The manufacture of silk fabrics, however, has gained great success. In 1810 Rodney and Horatio Hanks erected the first mill on this continent. The manufacture of silk trimmings of various kinds was begun in 1815 at Philadelphia and ribbons in 1829 at Baltimore. Here, too, the American manufacturer was handicapped by foreign competition and it was not until a protective tariff was enforced that the industry prospered.

In order to provide money to meet the heavy expenses of the government caused by the Civil War, a high import duty was placed on all luxuries, including silk. The duty was made 30 per cent on manufactured silk on 2 March 1861 and in August of the same year was raised to 40 per cent. The tariff was again advanced on 30 June 1864 to 60 per cent, this time not only for revenue but for protection. Following this advance there was an immediate show of activity among those engaged in silk importing to consider the possibilities of manufacturing at home. Those already engaged in the manufacture of silk received a fresh stimulus. In 1872 The Silk Association of America was organized, in New York, to promote in all measures the common interest of silk-making in the United States. At the Centennial Exposition held in Philadelphia in 1876 American-made silk favorably compared with that of foreign manufacture. Much of the

The Manufacture of Silk.—The filament spun by the silkworm into a cocoon is so fine that several must be reeled together to produce a thread of sufficient size to handle. This is done in large factories, called filatures. Here the cocoons are placed in basins of hot water near the boiling temperature. Several filaments from as many cocoons as are required for the size of the raw-silk thread desired, are combined, twisted and reeled into skeins. When the filament from one cocoon has become exhausted it is replaced by another cocoon and the reeler adjusts the size of the thread by controlling the number of fresh and partially exhausted cocoons which are forming the thread. A single cocoon of good quality may furnish from 400 to 800 yards of reelable filament. Asiatic silks reeled by different filatures and different qualities from the same filature are designated by colorful labels called "chops." Silk that has been reeled is known as raw silk. The damaged cocoons and the parts of each cocoon which cannot be reeled are known as waste silk. Waste silks are combed and spun into spun silk or silk-schappe yarns.

Silk is imported from Europe and Asia, Japan supplying by far the greater portion. Japanese raw silk is prepared for shipment in books containing from 25 to 30 tightly-rolled skeins. These are packed in bales weighing from 125 to 140 pounds. Chinese silks are packed and shipped in a manner quite similar to Japanese silks. Italian silks are packed in large bales weighing from 200 pounds upward.

The silk used in the manufacture of silk fabrics may be divided into three general classifications, as follows: (1) Silk threads as they come from the reeler where several of the cocoon threads have been united into one. (2) Silk known as organzine in which the original threads have been twisted and several of these twisted threads have been united together. (3) Silk known as tram in which threads coming from the reeling machine have been very lightly twisted together.

When silk threads are woven as they come from the reeler, without having been dyed, the natural gum which they contain gives them enough body to make them suitable for weaving. If the threads are dyed before weaving this gum is removed in the dyeing process, and to give the threads strength and cohesion, they are twisted before dyeing. This is the work of the throwster.

Throwing.—The throwing process divides silk into two broad classifications, organzine and tram. Organzine is generally used for the warp or length of the fabric and tram for the filling or width. Silk used for organzine is usually of better quality than silk used for tram as the organzine warp is subjected to more strain in the process of manufacturing.

In throwing organzine, the silk, after soaking, is first wound upon bobbins. It is then a single thread. Each single thread is twisted, usually 16 turns per inch. Two of these twisted threads are doubled together and the resulting thread is twisted in the opposite direction, usually 14 turns per inch. The twisting operations are known as spinning, and unite the filaments into one strong even thread which is suitable for warping. In some cases more than two threads are combined. In throwing tram, or the material with which the warp is filled, the silk goes through various operations similar to organzine, but because it is to be used as a filling and not subjected to the same continued strain as the warp, it is not as tightly twisted. The twist in tram is from two and one-half to five turns per inch. If the silk is to be dyed before weaving it must be taken from the bobbins and returned to skein form. Organzine is reeled into skeins of about 20,000 yards length and tram into skeins of shorter lengths according to the number of threads into which the silk has been doubled. After reeling, short ties or laces are inserted through the skeins at several places to keep them from tangling and knotting while passing through the dyeing and subsequent operations prior to weaving. The skeins are finally inspected and put up in large bundles ready for the dyer. There are many variations to the throwing process the most important of which is the making of crepe fabrics. To prepare silk threads for crepes the twist is greatly increased and runs from 60 to 75 turns per inch. This fabric is woven before being dyed.

Dyeing.—The dyer boils the skeins in soap and water which removes the natural gum from them and leaves them soft and lustrous. They are then rinsed and passed on to the dye vat. After dyeing the skeins are dried and packed for shipment to the weaver.

Weaving.—The silk entering into a woven fabric is known in the manufacturing trade by several names. The silk threads running lengthwise are called the warp and those run-

ning crosswise which bind the warp to make the fabric are known as the filling or the shot. They are also spoken of as picks.

An ordinary warp may have from 1,000 to 20,000 ends of thread in a yard of width. The process of putting the above number of threads on a beam to be placed into the loom is commonly known as the warping process. The threads are warped in bands of from 300 to 600 at a time, each band running the entire length of the warp, which may vary from 300 to 1,200 yards. When the necessary number of bands have been placed side by side on the roller the warp is then transferred in its entirety of from 1,000 to 15,000 ends to another beam and is placed in the back of the loom. Each individual thread of this warp is passed through the harness in the loom preliminary to being manipulated into the fabric. This process is known as entering the thread. If the loom contains an old warp which has already been entered in the harness the new warp is simply twisted on thread for thread to the old warp. In preparing filling for use in the loom the filling thread, generally tram, is wound on spools. These spools are placed in what is known as a quilling machine which transfers the silk from the spools to a long, thin cylinder called a quill. A quill when covered with silk is placed into the shuttle. Formerly the quill of a feather was used for this purpose and hence the name.

The modern power-loom is a strong iron frame, at the back of which is the horizontal beam or roller from which the warp unwinds, and at the front the roller on which the web is wound as it is made. Between the two is the harness which is a series of frames with eyelets, one for every thread, or set of threads, of the warp. In plain or taffeta weaving the harness frames are in two sets of three frames each, one set of which is up while the other is down. The number can be increased to several frames, all acting independent of each other, for complicated patterns. Between the beam and the harness is the reed, through which the warp threads pass to the take-up roller in front of the loom and between the harness and the web roller, the shuttle and the batten. As the machine revolves the warp threads passing from the beam through the reed, are lifted or depressed by the harness; in the opening made by such lifting or depressing, the shuttle flies across the warp and the batten beats up the thread it leaves and a new woof is added to the fabric. The complications of the fabric reveal themselves as soon as the power is turned on and the actual web begins to appear, close, compact and delicate.

Fancy weaves and patterns necessitating different colors are often woven on what is known as a box-loom. Fabrics vary from single colors to eight colors or more in the filling. This necessitates up to eight or more different shuttles being used for the filling. The containers for these shuttles on the loom are known as boxes, hence the term box-loom. In order to form complicated designs, individual warp threads of the loom were in olden times controlled by hand, the threads being lifted or depressed thus letting the shuttle pass over or under them, forming the weave. This method is still pursued in the making of the famous *Goblin tapestry* and is probably the best illustra-

tion of old-time weaving. Joseph Marie Jacquard, born in Lyons, France, in 1752, is the inventor of a mechanical device to lift or depress warp threads in making fancy designs, thus doing away with hand manipulation. This is known as the Jacquard machine and when placed on a loom the loom is called a Jacquard loom.

The finished fabric after leaving the loom is inspected for weaving defects, such as loose ends, knots, etc., and is ready to receive its final manipulation before passing into the hands of the consumer. If silk used in manufacture has been dyed before being woven the fabric after leaving the loom need receive but little handling. It is smoothed out on rollers and may or may not receive a certain amount of stiffening. If the article is woven in the gray, it must now be dyed or printed before being used.

Such in brief is the manufacture of broad silks, that is dress goods, tie silks, shirtings, etc. In 1914 the census reports show a production of over 216,000,000 yards of these goods valued at over \$137,000,000. Silk ribbons are made in a similar manner, except that on account of their narrowness many ribbons may be woven at one time on the same loom, according to their width. The 1914 production of ribbons was valued at over \$38,000,000.

Crepe effects in the finished goods are produced by alternating a right- and left-hand highly-twisted thread in the warp and filling the fabric with a lightly-twisted tram. When the woven goods are boiled off and dyed the effect of the alternately-twisted threads will be a puckering up of the fabric and this is known as crepe-de-chine. Similar effects may be produced by running a plain warp and filling this warp with the alternately hard-twisted crepe threads. This necessitates a box-loom. But the warping for this second fabric is very much easier than the warping for the first. To avoid mistakes in handling the wrong threads,

a slightly different tint, such as light blue and pink, is given to the right- and left-hand twisted threads. Hard-twisted threads in both warp and filling produce the georgette crepes.

Silk velvets and plush fabrics were formerly woven over wires so that small loops were formed on the face of the cloth which, upon being cut, made the pile. In modern manufacture two pieces are woven face to face, a sharp knife traveling between them cutting the pile threads apart. Velvets valued at \$8,000,000 and plushes at \$10,000,000 were produced in 1914.

Sewing silks and machine silks are tightly-twisted threads of raw silk, while floss and embroidery silks are loosely-twisted threads of raw silk. The production of these materials in 1914 was one and one-half million pounds, valued at nine and one-half million dollars.

The tables that follow indicate the growth of the silk industry in the United States:

POWER-LOOMS AND HAND-LOOMS IN THE UNITED STATES.

3. Foreign Silk Industry.—In the opening decades of the 9th century the chief silk-producing regions were Syria, Persia, India, Italy and France. With the opening of trade with China in the middle of the century great quantities of silk began to arrive in the markets of the world from Shanghai and later from Canton. Japan came into the field as an exporter about 1857 and was soon a serious competitor because of the high quality of its product. Today China and Japan export only their excess growth of silk, as the great bulk of their native silks are woven and sold in the home market. The same is to a large degree true of other silk-producing countries and regions of Asia. Within the last half-century the world's silk production (calculating only exports from the East, the total production there being unknown) has more than doubled. America is at present the greatest consumer of raw silk, followed at considerable distance by France. Lyons is the centre of the silk trade of France, producing chiefly dress goods. The chief centres of the ribbon trade are Saint Etienne and Saint Chamond. In addition to these there are large

1890. The consumption of raw material in normal years is approximately 3,250,000 pounds. The Caucasus supplies about 1,000,000 pounds of raw silk to the Russian mills, Moscow is the chief silk-manufacturing centre. Italy, once first in the trade of Europe has fallen to about sixth place as a manufacturing country, using only 2,000,000 pounds annually. As a producer of raw silk of fine quality it still holds a high place, producing about 10,000,000 pounds in normal years. Como, Genoa and Venice are still the chief seats of silk manufactures in Italy. Austria has important silk manufactures, mostly centred in Vienna; it consumes about 1,500,000 pounds of raw silk annually and produces about 500,000 pounds of this amount. Hungary produces nearly 1,000,000 pounds annually, most of which was formerly exported to the mills of Austria. England's silk manufactures have declined since 1860. Manchester, Macclesfield, Middleton, London and Nottingham are the chief centres of the industry there, which consumes annually about 1,700,000 pounds of raw silk. The following table gives the production of raw silk in 1913-19:

RAW SILK PRODUCTION, INCLUDING TUSSAH SILK.

* The production of raw silk in China is an unknown quantity. † Excludes Tussah silk. ‡ In the absence of statistics from Austria and the Levant, 1915 production is used as an estimate.

The domestic consumption of raw silk in Japan is estimated to be 25 per cent of the production. The remaining 75 per cent which is exported, being 32,485,000 pounds during the season 1918-1919, would indicate a crop of approximately 43,314,000 pounds.

The domestic consumption of raw silk (including Tussah) in China is estimated to be 55 per cent of the production. The exports from Canton and Shanghai during the season 1918-1919 were 14,520,000 pounds, which would indicate a crop of approximately 32,267,000 pounds.

Compiled by the Statistical Bureau of The Silk Association of America.

silk mills at Paris, Nimes, Calais, Avignon, Roubaix and Tours. France consumes in normal years about 10,000,000 pounds of raw silk and produces less than one-fifth of this amount. Germany consumes about 7,000,000 pounds annually. The industry there is centred at Crefeld. Velvet is the principal textile product of the German silk industry, occupying over half the entire number of looms. Other silk manufactures are located at Barmen, Elberfeld and Mülheim. Switzerland has an important silk trade, consuming about 4,000,000 pounds annually in normal years. Zurich produces satins, serges and other broad goods. Basel is an important centre of the silk ribbon trade. Silk manufacture received a great impetus in Russia by the enactment of a prohibitive tariff about

RAMSAY PEUGNET,

Secretary of the Silk Association of America.

SILK-COTTON TREES, any one of the trees belonging to several tropical genera of the family *Bombacaceæ*, as *Bombax*, *Ceiba*, *Eriodendron*, *Ochroma* and *Pachira*. They are usually large trees, the greater number native

to Central and South America, with handsome mallow-like flowers, light, soft wood and bark containing bast fibres used for cordage. Those species most entitled to the name are *Bombax malabaricum* of the East Indies, and *Ceiba pentandra*, of both the Oriental and American tropics. The latter, the silk-cotton tree of the West Indies, is one of the most abundant and largest trees of the Antillean forests, and is either low-branched or tall, with naked trunk and massive crown lifted high above the other trees. When young its trunk and branches are covered with sharp spines, which afterward disappear. The bark is hard, clean and white, surrounding a pulpy interior. The trunk is sometimes 100 feet high, and in well-grown specimens is without branches for the lower part; but as the tree ages the trunk enlarges near the ground, being sometimes 12 feet in diameter and great buttresses, tall and thin, spring from it on all sides and run out in an undulating fashion, for perhaps more than 100 feet along the surface of the ground, before finally penetrating the soil and anchoring the tree. These braces are invaluable for bracing the tree against heavy winds. The leaves are glossy, dark green and deciduous. The yellow flowers appear just before the leaves and are followed by great pods whose valves burst open when mature, causing the tree to seem smothered in glistening white thistle down. This is because the seeds are wholly invested in delicate cotton-like fibres, and being very light are carried off by the wind for long distances. Unfortunately, although closely allied to the cotton plant (*Gossypium*) these fibres are too short to be woven into textiles, but they are employed for stuffing cushions and other upholstery, and are an important article of trade, under the name "Kapok," the principal source of supply being Java. The seeds are eaten in some Pacific islands. *Ochroma lagopus* is also called down-tree, or cork-wood, on account of its light porous wood.

SILK-WEED. See ASCLEPIAS.

SILKWORM-GUT, a substance prepared from the silky secretions of the caterpillars of the ordinary silkworm taken from the insects' body, and constituting the lustrous and strong line so well known to anglers under the name of "gut." It is especially sought after because it is invisible in the water. In securing the secretion the worm is placed in vinegar and the incipient cocoon is then taken from it, soaked in water, dried and bleached to a pure white by passing through fumes of sulphur.

SILKWORMS, entomologically, any caterpillar which spins a cocoon of silky fibre; popularly, the various species which yield a fibre used commercially. All are caterpillars of moths and feed upon foliage of various trees and shrubs. Among the less important species the following are probably best known: The Japanese oak-feeding silk-moth (*Bombyx yamamai*) is noted for its green-tinted silk, which is used in Japan and China for embroidery; a close relative (*B. peryni*), also an oak-feeding insect, is a native of northern China, where its large grayish-brown cocoons are used to a considerable extent for threads and various fabrics. The Chinese also use for the manufacture of a soft fabric the gray silk of an

allied species (*B. cynthia*), which feeds on the tree of heaven (*Ailanthus glandulosa*). Since the thread cannot be reeled the silk is obtained by carding methods. So far as known these species have not been extensively employed commercially except in the Orient, though they have been used tentatively in France and other silk-manufacturing countries. The tussur or tusseh moth (*Antheraea paphia*) spins a hard grayish-white cocoon from which the natives of India, where the species is indigenous, manufacture tussur silk. The Bengalese use the pure white silk of the boro poloo (*Bombyx textor*) and the yellow silk of the dasee-worm (*B. fortunatus*) for making a silk cloth which rarely reaches the world's markets because of its inferior quality. Several North and South American species yield silk which has not become commercially important. The native silkworms of the United States, Mexico and Central America have never been properly commercially exploited or cultivated; but several varieties possess qualities which would seem to promise success to him who would raise them scientifically. They are hardy and spin large quantities of excellent, strong silk. They feed upon a much larger variety of food than do the silkworms commercially known to the Old World. This comprises the leaves of the oak, apple, maple, hickory, willow, sycamore and many other trees. One of the most promising of these American silkworms (*Telea polyphemus*) is a large buff-colored moth. The cocoon threads are bound together with a hard gluey matter which has to be softened before unwinding can be done. The Tropæoluna, the larva of which feeds on the leaves of several forest trees, is somewhat similar to the foregoing and both resemble the Yamanai. Cultivation and proper selection would undoubtedly improve them commercially. The amount of silk they produce is far greater and stronger than is produced by the Chinese silkworm, but the thread cannot be so easily reeled.

The most important and most widely disseminated species of silkworm is *Bombyx mori*, which belongs to the family Bombycidae, a native either of northern China or of Bengal. It seems to have been domesticated at a very early date, which is placed by Chinese authorities at 2600 B.C., when the wife of Emperor Hoang-ti began feeding the caterpillars. In 552 two monks brought eggs to Constantinople, superintended experiments in cultivating the worms and turned the industry over to the Emperor Justinian, by whom it was monopolized. Neighboring peoples soon took it up, however; and now many countries, especially those of the Mediterranean region, Persia, India and Arabia, raise silk in commercial quantities.

The commercial silkworm is the larva of a large moth with a short thick body, stout legs and broad white wings crossed by several black lines or by a pale bar upon the anterior pair. In early summer the females lay from 200 to 500 bluish eggs, about as large as a pin's head, singly upon any convenient surface, gluing them there by a mucilaginous secretion, silky when dry. These do not hatch until the following spring. Then the larvæ, about one-quarter of an inch long and yellowish-gray or brownish, begin to feed, and soon consume about their

own weight of foliage daily and increase rapidly in size. When about 10 days old they become lethargic and stop eating until after they have cast their skins. In this operation the old skin bursts near the front and the caterpillar squirms itself out, leaving the old skin attached to the branch or leaf upon which it was stationed. The worms rapidly increase in size immediately after the molt, then steadily diminish as the time for the next molt approaches. The process is performed four times before the caterpillar spins its cocoon, which it does when about six weeks old. At this time it is about three inches long and half an inch in diameter, has 12 visible body segments, three pairs of true legs and five pairs of pro-legs. It now ceases to feed, empties its alimentary tract, and seems to shrink in size. The spinning then begins by the insect making first an outer network known as the "floss," and then winding the silk in a continuous thread around its body which continues to decrease in size. The completed cocoon is considerably shorter than the caterpillar itself, being only about one and one-half inches long. The operation of spinning occupies about five days, during which time the insect usually produces from 2,000 to 3,000 feet of silk, which, when microscopically examined, is seen to consist of two blended strands. These are produced by special glands (sericteria) which extend nearly the whole length of the body and terminate in apertures (spinnerets) situated in the mouth. In from 15 to 20 days after the chrysalis has been formed the adult insect emerges, lays its eggs and dies. It has been estimated that there are about 20,000 to 40,000 eggs, popularly known as "seed" in an ounce. About one ounce of eggs will yield 100 pounds of cocoons or nine pounds of raw silk. From 15 to 20 pounds of good mulberry leaves should yield one pound of cocoons; and a well-grown mulberry tree should yield about 100 pounds of leaves. The amount of space allowed for the caterpillars produced from an ounce of eggs varies from one square yard, immediately after hatching, to about 64 square yards when spinning time arrives—each change being double the previous space: 2, 4, 8, 16 and 32.

The food of the caterpillars is preferably the foliage of the white mulberry tree (*Morus alba*); but several other species are employed, notably the Japanese mulberry (*M. japonica*), the alpine mulberry (*M. alpina*), and *M. multicaulis* and *M. moretti*. The osage orange (q.v.) is occasionally used as a substitute, but is said to produce an inferior grade of silk. The black mulberry (*M. nigra*) is objectionable because it is slow in growth. The caterpillars also thrive upon the leaves of lettuce and some other plants.

In the cultivation of the silkworm the first requisite is an ample supply of foliage. This is usually obtained by growing the mulberry trees far enough apart to give each ample room to develop its branches in all directions, the distance varying from 15 to 40 feet depending upon the variety, method of training, etc. Frequently the trees are treated much the same as in pollarding (q.v.), except that the branches are cut while small. The eggs having been kept over winter at a temperature of less than 50° F. in a dry circulating atmosphere, are

placed in a room or an incubator in which the temperature is raised gradually to about 73°. In about 10 days the larvæ emerge and are covered with sheets of perforated paper sprinkled with chopped mulberry leaves, which should be renewed about nine times during the first 24 hours, each time by placing a fresh paper above the soiled one, which should be burned. Paper with larger perforations is necessary as the worms grow. As they approach maturity their appetites become voracious. When ready to spin they should be supplied with brush, straw or other material upon which to form their cocoons and the temperature at this time should be kept about 75° and the humidity close to 65°. At all times scrupulous cleanliness is essential, as also is abundant fresh air. When spinning is completed, no sound is heard inside the cocoon. The cocoons are then sorted according to quality, size and color into nine grades for manufacture, a separate lot being selected for breeding. The sexes are readily recognized, the males being smaller and their cocoons having more pointed ends than those of the females. After grading they are heated to destroy the insects within, whose emergence, if left alive, would break the thread many times. The manufacturing process is then begun.

Where a uniform and favorable temperature is not maintained, where humidity and purity of the air are impaired, and still more, where there is deviation from the strictest cleanliness, silk growers have often experienced serious losses of their caterpillars at all stages of their growth. Purifying the breeding and feeding quarters after each "crop," and again before the introduction of a new one, are essential. The walls are whitewashed, the trays sterilized in various ways, and the apartments fumigated with burning sulphur. No detail that will ensure cleanliness throughout the feeding period must be neglected, else the worms may suffer from the diseases which follow in the wake of neglect. Four of these, called in France pébrine, muscardine, gattine and flacherie, are due to infectious organisms. For a fifth disease, grasse, no ascribable cause has been discovered. Pébrine devastated France to such an extent that by 1847 eggs were all imported from Italy. By 1865 the only safe source of egg-supply was Japan. Pasteur showed that rational methods of cleanliness in the breeding and feeding were the only remedy; the result is that France exports over 300,000 ounces of eggs annually. See SILK AND SILK INDUSTRY.

W., 'Mulberry and Other Silkworm Food Plants' (Washington 1907); Verson and Quajat, 'Il filugello e l'arte sericola' (Padua 1896); Villon, 'La Soie' (Paris 1890).

SILL, Edward Rowland, American scholar and poet: b. Windsor, Conn., 29 April 1841; d. Cleveland Falls, Ohio, 27 Feb. 1887. He was graduated from Yale in 1861, entered business in California, but returned to the East, and studied at the Harvard Divinity School. His views toward the ministry, however, he soon abandoned; and he became literary critic on the staff of the New York *Evening Mail*. Thence he went to Ohio, where he did some teaching,

and to California, where he was made principal of the Oakland high school (1871) and professor of English literature in the University of California. In 1883 he returned to Ohio to devote himself wholly to literary work. Sill did not write readily, nor willingly collect what he had at intervals printed in magazines, particularly the *Atlantic*. He won, nevertheless, a recognition which, if not general, is ample, and a just tribute to real gifts. He wrote with a certain terse austerity not, as has been pointed out, unlike Emerson. Indeed, he was, in thought and manner, a later transcendentalist. One of his poems, 'The Fool's Prayer,' is the property of every anthology. The posthumous selection, 'Poems' (1888), contains his best. 'Hermione, and Other Poems' appeared in 1899, and in 1900 'The Prose of Edward Rowland Sill, with an Introduction Comprising Some Familiar Letters.' Consult Parker, W. B. (ed.) 'Poetical Works of Edward Rowland Sill' (1906); id., 'Edward Rowland Sill: His Life and Work' (Boston 1915).

SILL, Joshua Woodrow, American general: b. Chillicothe, Ohio, 6 Dec. 1831; d. Murfreesboro, Tenn., 31 Dec. 1862. He was graduated from the United States Military Academy in 1853, and was soon called to the academy as assistant professor of ethics, geography and history. He resigned from the army in 1861 and became professor of civil engineering and mathematics in the Brooklyn Polytechnic Institute. He commanded a division of the army of Ohio in 1862, and was killed while leading his brigade at the battle of Murfreesboro.

SILL. See DIKE.

SILLIMAN, sil'i-man, **Benjamin**, American scientist: b. North Stratford (now Trumbull), Conn., 8 Aug. 1779; d. New Haven, Conn., 24 Nov. 1864. He was graduated from Yale in 1796, studied law and was admitted to the bar in 1802, but accepted the chair of chemistry and natural history at Yale in 1802. He went abroad in 1805 to continue his studies, and while in Edinburgh became interested in geology. On his return home he made a geological survey of a part of Connecticut, the first survey of the kind made in the United States, and in 1807 published an account of the celebrated Weston meteorite of 14 Dec. 1807. In 1811 he began a series of experiments with the compound blow-pipe, obtained for the first time in the United States the metals sodium and potassium, and discovered in 1822 the fusion of the carbons in the voltaic arc. He founded the *American Journal of Science* in 1818, acting as its sole editor until 1838, and as senior editor until 1846, opened the Lowell Institute in Boston with a series of lectures on geology in 1838, and in 1840 was elected president of the American Association of Geologists. He resigned his chair at Yale in 1853 and was made professor emeritus, but continued to lecture until 1855 when he retired. He was named by Congress for one of the original members of the National Academy of Sciences in 1863. His publications include 'Journal of Travels in England' (1810); 'A Tour to Quebec' (1819); 'Elements of Chemistry' (1829); 'Consistency of Discoveries of Modern Geology with the Sacred History of the Creation and the Deluge' (1837); 'Narration of a visit to Europe in 1851' (1854), etc. Consult Fisher, 'Life of Benjamin Silliman'.

(2 vols., New York 1866) and Gilman, D. C., 'Leading American Men of Science' (New York 1910).

SILLIMAN, Benjamin, American chemist, son of the preceding: b. New Haven, Conn., 4 Dec. 1816; d. there, 14 Jan. 1885. He was graduated from Yale in 1837 and in 1838 became instructor in chemistry, mineralogy and geology at Yale, was appointed professor of applied chemistry in 1846 and in 1854 succeeded his father in the chair of chemistry, a position he occupied until his death. He was one of the founders in 1847 of the Yale Scientific School and was professor of medical chemistry and toxicology in the University of Louisville, Ky., in 1849-54. He was in charge of the departments of chemistry, mineralogy and geology at the World's Fair in New York in 1853, was elected one of the original members of the National Academy of Sciences in 1863, and in 1869 became one of the State chemists of Connecticut. He published 'First Principles of Chemistry' (1846; 2d ed., 1856); 'Principles of Physics' (1854; rev. ed., 1868); 'American Contributions to Chemistry' (1875), etc. Consult Wright, A. W. (in National Academy of Sciences, 'Biographical Memoirs,' Vol. VII, Washington 1911).

SILLIMANITE, a mineral occurring in long slender crystals and fibrous masses, and composed of silicate of aluminium (silica 36.9, alumina 63.1 = 100). Its crystals belong to the orthorhombic system; its hardness varies from 6 to 7 and its specific gravity from 3.2 to 3.3. The color is various shades of brown, or gray, or greenish. The streak is uncolored and the mineral varies from transparent to translucent. It occurs in gneiss, mica schist and other metamorphic rocks in Massachusetts, Connecticut, New York, Pennsylvania, Delaware, North Carolina, etc. The name was given in honor of Professor Silliman of New Haven.

SILO, a building for the preservation of green fodder, usually cut fine before storing, and known as silage (q.v.). Originally silos were merely pits dug in the ground and filled with green fodder which was closely covered to exclude the air. From 1875 the silo built above ground of wood, brick, concrete and other permanent materials has come into use and is steadily increasing in numbers. Silos are built on a cement foundation, and most frequently are of wood, which is equally efficient in preserving silage and while of less permanent character is selected because its initial cost is less. The buildings are air tight, usually of circular shape (the rectangular type permitting the silage to spoil in the corners), are roofed and usually about 30 feet in depth. The greater depth insures the silage packing solidly, excluding the air. The walls are vertical and finished smoothly inside in order that the silage may settle evenly. Openings are provided one above another on the side most convenient for feeding so that the contents of the silo are readily reached, but none is required in the top space because of the settling of the silage. Concrete makes an excellent and permanent building, and brick and stone, lined with cement are likewise desirable.

SILOAM SPRINGS, Ark., city in Benton County, 40 miles southwest of Bentonville, on the Kansas City Southern and other railroads.

It is located in a prosperous agricultural region, and has flouring mills, corn and feed mills, ice and storage plant and a large cider and vinegar plant. It has two banks with deposits in excess of \$1,000,000. The value of the city's taxable property is \$800,000. It is the seat of Siloam College and a high school. There are seven churches, a city hospital and a municipal building. Pop. 4,000.

SILOAM, sī-lō'am, or **SILOAH**, sī-lō'ā, a pool or tank in Jerusalem, fed by the waters of Gihon and forming part of the ancient water-supply system of the city: a tunnel of 1,700 feet leads to the pool from the "fountain of the Virgin." In 1880 some boys playing in the pool crawled into this ancient tunnel, and one of them noticed a tablet bearing an inscription. That inscription, as deciphered by scholars in 1881, tells of errors of measurement committed by the miners and how they were corrected. In places the inscription is undecipherable, but, line for line, it is rendered thus:

1. Lo the tunnel. Now this is the history of the tunnel. While yet the miners were plying
2. The pick, each toward his fellow and while there were yet three cubits to be cut, there was heard the voice of a man
3. Calling to his fellow, for there was a *misdirection** in the rock on the right hand . . . and on the day
4. Of tunneling through, the cutters smote pick against pick and there flowed
5. The water from the channel to the pool, 1,200 cubits, and
6. Cubits was the height of the rock above the excavator's heads.

* Conjectural.

Hezekiah is believed to have built this water-supply system. Scholars are not in agreement as to the date of the inscription, some holding that it dates from a period long subsequent to that of Hezekiah even as late as 200 B.C. Consult Socin, A., 'Die Siloahinschrift' (Freiburg 1899) and Tobler, 'Die Siloahquelle und der Oelberg' (Saint-Gall 1852).

SILOXICON. See ELECTROCHEMICAL INDUSTRIES.

SILURES, sīl'ū-rēz, the name of an ancient British tribe which inhabited the district included in the modern counties of Hereford, Radnor, Brecknock, Monmouth and Glamorgan. They were of the earlier Celtic stock, and were among the most warlike of the British tribes. They were subdued by the Romans about 78 A.D. Cærwent was founded by them, but was later Romanized.

SILURIAN, a term applied in 1835 by Sir Roderick Murchison, director-general of the Geological Survey of Great Britain, to those rocks of South Wales (the country of the old Silures), which were formerly included as "grauwacke" in the Transition System of rocks. The term is also applied to the period during which this system of rocks was laid down, now recognized as the third period of the Paleozoic Era. In the typical region the rocks are divided as follows:

		Approx. average thickness (feet)
Upper Silurian	{ 6. Ludlow Group.....	1,900
	{ 5. Wenlock Group.....	1,600
	{ 4. Llandovery Group.....	3,000
Lower Silurian	{ 3. Bala and Cardoc Group....	6,000
	{ 2. Llandeilo Group.....	3,000
	{ 1. Arenig Group.....	4,000
		19,500

While Murchison was studying these strata

in South Wales, the renowned Adam Sedgwick studied the rocks of North Wales, making out their true succession, and naming them "Cambrian," from the ancient name of the district, Cambria. These were also divided into an upper and lower division, and as the study continued year after year, higher and higher strata were added to the top of the Cambrian series. Likewise, in the study of the Silurian strata, Murchison included lower and lower strata, and thus the two systems overlapped. It finally appeared that Murchison's Lower Silurian and Sedgwick's Upper Cambrian were equivalents, and this gave rise to a long controversy as to the use of the proper term. This controversy outlived the two principals, and has only recently been settled by the adoption of Lapworth's name "Ordovician" for the middle series. Thus the term Silurian is restricted today by most geologists to the Upper Silurian of Murchison.

In North America the following subdivisions are recognized:

Upper Silurian or Cayugan group.

Manlius limestones,
Bertie limestones,
Salina formation.

Middle Silurian or Niagaran group.

Guelph formation,
Lockport dolomites,
Rochester shales,
Clinton formation.

Lower Silurian or Oswegan group.

Medina sandstone,
Oneida conglomerate or sandstone.

Ordovician precedes and Devonian follows the Silurian. The formations are typically exposed in the State of New York, where the lower members are conglomerates and sandstones, the middle shales, limestones and dolomites and the upper shales and shaly limestones. The formations are best exposed along the Niagara River, where most of them are visible. The aggregate thickness here is 2,100 feet, though the upper member (Manlius) is partially absent. Eastward in New York some strata thin out, while others are absent through erosion. The Silurian strata are well developed in Michigan, Ohio, Indiana, Illinois, Wisconsin, Kentucky and Tennessee, though generally much thinner than in New York. They are also more calcareous. In the Appalachians the Silurian strata are frequently represented by shore deposits. Throughout most of their extent, the strata are richly fossiliferous, containing sponges, graptolites, corals, brachiopods, mollusks and trilobites. Fish are also found, but are rare. Toward the end of Silurian time the remarkable crustaceans known as eurypterids (q.v.) became abundant and constituted a marked feature of the life.

As a result of the Taconic Revolution, at the close of the Ordovician (q.v.), the seas were much restricted at the beginning of the Silurian, in the United States. During the Clinton coastal swamp conditions prevailed over much of Eastern United States, and great sedimentary beds of iron ore were laid down, from New York to Alabama. These are very extensively mined in New York and at Birmingham, Ala. During mid-Silurian time the interior continental sea was very greatly enlarged, and was united with the waters covering parts of Europe, probably by a channel across the

Arctic region. This permitted migration from European seas into central North America, so that we find many Silurian fossils of this region also common in the European localities (Gotland, etc.). The widespread Niagara limestone was formed in this sea. Migration along an Atlantic coast line between Western Europe and eastern North America also took place in Silurian time, as shown by the similar faunal characteristics of the Silurian beds of Maine and the island of Anticosti to those of southern England.

In late Silurian time the waters of the interior sea were entirely enclosed and life became extinct, the sea water itself becoming highly concentrated, probably under desert conditions. In this enclosed basin the salt-bearing strata of the Salina formation were laid down, and these now constitute a great commercial source of salt.

Widespread marine formations in Europe show that that continent was also widely covered by shallow seas during the period. A central land mass probably separated a northern and a southern sea. See GEOLOGY; SALINA FORMATION; SALT.

SILURIDÆ. See CATFISH.

SILURIST, The. See VAUGHAN, HENRY.

SILVANUS, sîl-vā'nūs. See MARS.

SILVA, sêl'va, José Asunción, Colombian poet: b. 1860; d. 1896. Though apparently very much of a pessimist, his poems abound in evidence that his pessimism was to a great extent accidental and unnatural to the poet. He displays a deep love of nature, of the beauty of the musical sound of words, and, at times, of the mere joy of living. His nature was deeply poetical, and he suffered from an over-sensitiveness which helped to embitter his life. This bitterness, which constantly creeps out, accentuates and gives peculiar vivacity to his pessimism. Silva, who was of an old, wealthy and aristocratic Colombian family, found himself reduced, through the fortunes of revolution, to poverty. As his father had already died, he was forced to support the family. He struggled on against adverse fortune, writing because he needs must write to give expression to his burning soul, but unable to find a publisher for his work, and too poor to issue it at his own expense. At the same time he waged an unsuccessful fight for the recovery of his father's property. Finally he found a publisher in France, and for a time hope ran high, but the vessel bearing the manuscript to Europe was lost at sea. In his later days he became a literary figure in Latin America through his contributions to the press; but it was not until after his death that his poems were issued in book-form. Some of his poems like the 'Crepúsculo,' 'Ante la Estatua' (of Bolívar), 'El Día de Difuntos' and 'Los Nocturnos' are known wherever the Spanish language is spoken. There are few Latin American writers whose work is so hard to translate into a foreign tongue as that of Silva. He has a strange power over the melody of words and a deep and fanciful imagination of a distinctly poetical caste. About his work there is a haunting sense of melody that recalls the best of Poe's poetry; though Silva never displays the weird fancy of the latter's tales. He was original in many ways; his lines are

often as musical as the best in the Spanish tongue. He invented new rhymes, reformed and reshaped old ones, introduced still others from foreign languages and successfully adapted them to the Spanish tongue. His innovations and his mannerisms were widely imitated and had their influence upon the younger generation of Latin-American poets, of which the leaders were Rubén Darío (q.v.) and José Santos Chocano. Owing, however, to the peculiarity of his style and his unnatural pessimism, the poetry produced by his imitators has been, for the most part, of rather indifferent quality. But his influence has been decidedly beneficial in leading Latin-American poets to attempt to fit the music of words to the beauty and harmony of poetic thought, and to seek more freedom and flexibility in the use of poetic forms. Consult Blanco Fombona, José, 'Letras y Letrados de Hispano America'; Coester, A., 'Literary History of Spanish America' (New York 1917); La Habana, 'Arpas Cubanas' (1904); Mityans, A., 'Estudio sobre el movimiento científico y literario de Cuba' (Habana 1890).

SILVAS AMERICANAS. Although some critics might deny that Andrés Bello is the greatest Spanish-American poet, certainly no one will deny that his 'Silva to Agriculture in the Torrid Zone' is the greatest poem that Spanish America has yet produced. The other of the two silvas, 'Allocution to Poetry,' is fragmentary, one part containing an address to poetry, the other to Colombia. Bello probably despaired of completing this poem on the grandiose scale he had planned, and in 1826, three years after the appearance of the fragments, he published the second silva to agriculture, more restricted in scope and containing lines taken from the first. A silva is a metrical composition of lines of seven and eleven syllables, some in free version, others rhyming without fixed rule. Bello's 'Silvas' are the most exquisite imitations in Spanish of Virgil's 'Georgics'; the author's style is noble and ethical and he is a finished master of poetic diction. With lofty inspiration Bello urges his compatriots to give up political strife and greed for wealth, and seek peace and happiness in the cultivation of the beautiful exotic vegetation of young America. M. A. Caro's 'Poesías de Andrés Bello' contains a very good critical introduction. Extracts can be found in Hill's and Morley's 'Modern Spanish Lyrics,' which contains an excellent article on Bello.

SAMUEL M. WAXMAN.

SILVELA, sêl-vâ'la, Francisco, Spanish statesman and Conservative leader: b. Madrid, 1843; d. 29 May 1905. He studied law and entering politics became a member of the Cortes in 1869. Ten years later he held the portfolio of Minister of the Interior in the Campos ministry and that of Minister of Justice in 1883-84. In 1899 he became Prime Minister, which office he held until October 1900, when he was obliged to resign. In 1902 he was again called on to form a cabinet and retired the following year. He was for many years the foremost leader of the Spanish Conservatives. He was elected to the Royal Spanish Academy and to the academies of fine arts and of history, moral and political sciences.

SILVER, one of the best known metals, has been in use for a long period, probably since before the beginning of history. It is widely distributed and can be easily extracted from some of its ores.

Physical Properties.—Silver is very malleable and ductile, being surpassed only by gold in these qualities. It is harder than gold, but softer than copper. It can be rolled into sheets 1/1000 inch thick, and silver foil is made thin enough to transmit light. Silver leads all the metals as a conductor of electricity and is second only to gold as a conductor of heat. Its specific gravity is about 10.46; its melting point 960°C. , and it can be distilled as a greenish vapor in the electric arc, its boiling point being over $2,000^{\circ}\text{C.}$ When molten it can absorb oxygen to 22 times its own volume; this is given off when the metal cools, causing the phenomenon known as "spitting." This occurs only when the silver is pure and a very small per cent of copper, zinc or bismuth prevents it, as does a layer of some substance having no oxidizing action of the molten metal, like powder charcoal or common salt.

Chemical Properties.—Silver alloys readily with mercury, lead, zinc, gold and copper. The alloy with mercury, known as silver amalgam, is formed in various processes for extracting silver from ores, mercury being able to extract metallic silver from its compounds with chlorine, bromine and iodine. If such an amalgam be heated above the boiling point of mercury, the mercury volatilizes, leaving the silver. Lead has the power of extracting silver from its compounds with copper, sulphur, arsenic, antimony and silver salts by the formation of lead-silver alloys, a property of great metallurgical importance in the treatment of silver ores. Alloys of silver and copper are formed in smelting argentiferous copper ores, the silver and copper being subsequently separated by refining. As pure silver is soft and abrades easily, all silver used in coinage or for making silverware is alloyed with copper to give hardness. The United States silver coinage contains 900 parts silver and 100 parts copper; British coinage contains 925 parts silver and 75 parts copper.

Silver is not affected by either dry or moist air at ordinary temperatures, neither is it affected by caustic alkalis or vegetable acids. It is dissolved by hot, concentrated sulphuric acid and easily dissolved by nitric acid. Sulphuretted hydrogen forms black silver sulphide and to this is due the familiar tarnishing or blackening of silverware, either by articles of food containing sulphur, as eggs, or by the minute percentage of sulphuretted hydrogen contained in city air or the air of rooms when coal gas is used as an illuminant. So-called oxidized silver is silver with a superficial black coating obtained by immersing in potassium sulphide or platinum chloride. Frosted silver has a rough dead surface produced by heating with nitre.

Silver forms three oxides, but none is of any particular importance. Silver chloride (AgCl), readily formed as a curdy white precipitate on adding a soluble chloride to an acid solution of a silver salt, is insoluble in acids but readily soluble in ammonia, in potassium cyanide and in sodium hyposulphite and less soluble in a saturated solution of any one of several

chlorides. It is also formed in treating silver ores with common salt. Silver nitrate (AgNO_3), formed by dissolving silver in nitric acid, is a white crystalline salt readily soluble in water. Fused and cast into sticks, it is known as lunar caustic and is used in surgery. In solution it is used as a chemical reagent. Silver bromide (AgBr) and silver iodide (AgI) resemble the chloride and like it are used in photography. Silver sulphate (Ag_2SO_4), a slightly yellow crystalline salt, is readily soluble in hot water but less in cold. Silver sulphide, black, is formed by adding a soluble sulphide to a silver salt.

Silver Ores.—The minerals which, singly or in combination, are mined as silver ores may be divided into three classes: Silver minerals proper, lead silver minerals and lead copper minerals. In the first class come native silver; cerargyrite, argentite, pyrrargyrite, proustite. Native silver occurs in irregular bunches or thread-like or branching masses, either by itself or associated with other silver ores or with native copper. It adds to the value of an ore body, but rarely occurs in sufficient quantity to be worked for itself. The once famous Silver Islet mine on the north shore of Lake Superior produced splendid specimens of native silver. Cerargyrite, horn silver, is the chloride and contains 75.3 per cent of silver when pure. It occurs in horn-like masses, of a grayish color which turns black on exposure to light, is so soft that it can be easily cut with a knife and is of common occurrence in what is known as the oxidized zone of mines worked for silver. Rich masses have been taken from the mines at Leadville, Colo., and there are many other mines producing this ore in the West. Larger quantities have come from some Mexican mines, particularly those in Guanajuato. Embolite, a chlorobromide, $\text{Ag}(\text{ClBr})$, bromyrite, the bromide, and iodyrite, the iodide, resemble horn silver closely and are found associated with it. Argentite, or silver-glance, silver sulphide (Ag_2S) is the commonest of the silver minerals proper. It is black, has a metallic lustre and cuts easily, though harder than horn-silver. When pure it contains 87.1 per cent of silver. Silver sulphide combines readily with the sulphides of antimony or arsenic, forming double salts. Of these pyrrargyrite ($3\text{Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$) or ruby silver ore contains 60 per cent of silver, proustite ($3\text{Ag}_2\text{S} \cdot \text{As}_2\text{S}_3$), also called ruby silver ore, contains 65.5 per cent; stephanite ($5\text{Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$) 68.5 per cent and polybasite ($\text{Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$) nominally contains 75.6 per cent silver, but usually part of the silver is replaced by copper and part of the antimony by arsenic. These double sulphides at American silver mines seldom occur in bodies of sufficient size and purity to be worked alone, but are not uncommon. One or more are found at mines in Montana, Idaho, Utah, Colorado and Arizona. Large masses of pyrrargyrite have been taken from mines in the state of Guanajuato, Mexico. Mention may be made of the mines in the Ruby district of Gunnison County, Colo., and at Silver City, Idaho. The silver ores usually occur in veins or in irregular replacement deposits formed by hot magmatic waters in the vicinity of igneous intrusions.

Silver being a precious metal a small per cent of it in lead or copper ores makes it the metal of chief value. Even when it is the metal

of lower value a few ounces in a ton of ore means the difference between profit and loss in working a mine. Of the lead-silver ores by far the most important is galena, lead sulphide (PbS). Practically all galena contains silver, the extremes being represented by galena from Carinthia, Austria, containing .05 ounce per ton, and from Idaho, up to 2,040 ounces per ton. In galena the silver is present either as isomorphous silver sulphide or some finely disseminated silver mineral. In oxydized lead ores, cerussite, etc., the silver is mostly present as chloride. Of the strictly copper silver ores, the most important is tetrahedrite, or gray copper ore, which is essentially a sulphide of copper and antimony ($4\text{CuS.Sb}_2\text{S}_3$), though actually of very varying composition, and the related mineral tennantite ($4\text{CuS.As}_2\text{S}_3$), also called gray copper. These minerals are of common occurrence in Gunnison, Clear Creek, Summit and Gilpin counties, Colo. Silver is also found associated with chalcopryite, chalcocite, bornite and other copper minerals, also with iron pyrite, zinc blende, hematite and various minerals, all of which may be classed as silver ores when the percentage of silver is enough to make its extraction profitable. To-day the largest part of the world's silver supply comes from mines not worked for silver alone but rather for gold, copper or lead, the silver being a by-product. Thus it happens that the operation of many silver-producing mines and the resulting output of silver depend not on the market price of silver but on the price of lead or copper. This is not true, however, of the Cobalt district, Ontario, where silver is the leading metal and cobalt and nickel are by-products.

Metallurgy of Silver Ores.—Silver ores as previously noted may be divided into silver ores, proper, silver-lead and silver-copper ores. They may also be divided into (1) free-milling; (2) refractory and (3) smelting ores. The first includes native silver, also the chloride and bromide of silver, the metal being extracted by its forming an amalgam with mercury. In so-called refractory ores, usually silver sulphide with or without the sulphides of arsenic and antimony, the ores are roasted with salt or otherwise treated prior to amalgamation. The smelting ores include particularly silver-lead and silver-copper ores. The oldest of the methods of extracting silver by amalgamation, one still used in Mexico, is the patio process. In this the ore is coarsely crushed by stamps or by a Chilean mill, then transferred to an arastra, a circular space paved with stone, where the ore mixed with water is ground fine under heavy stones drawn around by mules. By the addition of mercury all gold and free silver are extracted. The wet ore is then spread on the patio or amalgamating floor, thoroughly mixed with 3 to 5 per cent of salt, by mules treading it, allowed to stand a few days and then copper sulphate and mercury are added and the ore well trodden for several days, mercury being added from time to time to collect the silver as an amalgam. The chemical reactions which take place are complicated. Finally the mass is washed to remove non-metallic material, the heavy silver amalgam is collected and the mercury recovered by distillation, leaving the silver. Of the modern amalgamation processes the Washoe was developed for treating the complex

silver-gold ores of the Comstock lode. The ore was broken in a crusher, reduced to pulp by stamps and then transferred to iron pans four to six feet in diameter, known as amalgamating pans. The pans had a false bottom or die, on which revolved an iron plate, or muller, having cast-iron shoes. The ore pulp, one to three tons, with the necessary amount of salt, copper sulphate and mercury, was heated with a steam coil or by blowing in steam and ground three to five hours. Then the light material was washed away and the amalgam collected. Various modifications of the Washoe process have been devised and there are still many mills using some form of pan amalgamation, but the extraction is usually not very high. Silver chloride is soluble in a saturated soluble solution of salt and more soluble in sodium hyposulphite. Hence processes have been devised which aim to convert the silver in an ore to a chloride by roasting with salt, and then remove it by leaching. In the Augustin process the roasted ore is leached with a solution of salt, and in the Russell process with sodium hyposulphite and cuprous sodium hyposulphite. Neither process is now in use in the United States.

Smelting, where practicable, has the advantages of simplicity, speed and often high extraction as compared with all other methods of treating ores not free-milling. It is the regular method of treating lead-silver and copper-silver ores. Lead ores are smelted in the usual way (see LEAD); the silver goes into the lead and is recovered by the zinc, or Parkes, process. In the copper ores (see COPPER) the silver goes with the copper and may be separated by electrolytic refining. Gold-silver alloys obtained from milling or smelting ores of many varieties are also treated electrolytically (see GOLD). The silver obtained from some silver-lead ores is often purified by cupellation. A small reverberatory furnace with a hearth of bone ash is used. The lead bullion is melted, the lead oxydized to litharge by a jet of air until the silver bath is clear, then the silver is cast in molds forming silver pigs or bars. Many ores carrying silver go to concentrating mills equipped with jigs, vanners, etc., for separating the ore from the gangue. The concentrates thus obtained are usually smelted.

Silver Producing Districts.—A large producer of silver is the Broken Hill Proprietary Co., of New South Wales, Australia. The once famous Comstock lode mines in Nevada, which produced ore carrying values of two parts gold to three parts silver, are now unimportant, and probably the largest individual silver producer in the United States is the Amalgamated Copper Co., the silver being a by-product of its mines at Butte, Mont. Leadville, Colo., is an important silver-producing camp, but the ores are now generally low-grade. Silver Cliff and Aspen, Colo., were noted for their output of high-grade silver ores. In Utah the mines at Park City, notably the Daly West, are large producers of silver, though the ores also contain gold, lead and copper. In Idaho the silver-lead mines of the Cœur d'Alene region produce in the aggregate much silver. In Mexico the states of Chihuahua, Durango, Guanajuato and Hidalgo all contain important silver-gold or silver-lead mines. The mines of Guanajuato are estimated to have produced one-sixth of the silver of the world and the Valenciana has an established

record of production of 300,000,000 ounces. In South America the once famous mines of Cerro de Pasco in Peru are to be worked again by a New York company, but chiefly for copper. The silver output of the Cerro de Pasco mines from their discovery in 1630 up to 1886 is estimated at 462,250,000 ounces. In Ontario, Canada, the Cobalt District is one of the world's leading silver camps. In Europe, Germany is the most important silver-producing country, the metal coming from the Mansfeld copper mines, the silver-lead mines at Mechnich and the mines of the upper and lower Harz.

The world's production of silver in 1908 amounted to 203,186,370 troy ounces, valued at \$108,684,400. Mexico that year led the world in silver production, and Mexico and the United States together produced nearly 70 per cent of the total output. Estimates based on the most reliable information gave the world production of silver for the calendar year, 1917, by countries, as follows:

COUNTRY	Ounces, fine	Value (\$0.89525)
North America — United States	71,740,400	\$64,225,593
Canada.....	22,151,000	19,830,683
Mexico.....	31,214,000	27,944,333
Total.....	125,105,400	\$112,000,609
Central American States and W. Indies	2,369,500	\$2,121,295

Total.....	1,194,400	\$1,069,287
Total for world.....	163,992,700	\$146,814,465

With the exception of the years 1895 and 1902 when Mexico first led, the United States led the world in silver production for over 30 years up to 1902. Of the continents North America is easily first, with Europe now second.

The output of the chief silver-producing States of the Union in 1917, according to reliable authorities, was approximately as follows:

STATE OR TERRITORY	Silver	
	Pine oes.	Value
Alabama.....	1,351,100	\$1,112,600
Alaska.....	8,183,200	6,738,900
Arizona.....	1,989,800	1,638,600
California.....	8,163,600	6,722,700
Colorado.....	11,683,100	9,621,000
Idaho.....	3,300	2,700
Illinois.....	1,100	900
Maryland.....	686,700	565,500
Michigan.....	21,100	17,400
Missouri.....	13,711,100	11,291,100
Montana.....	11,441,000	9,421,700
Nevada.....	1,313,700	1,081,800
New Mexico.....	2,800	2,300
North Carolina.....	215,700	177,600
Oregon.....	191,100	157,400

Philippines.....		
Total.....	74,244,500	\$61,139,600

Uses of Silver.— Silver is used for coinage and for ornamental articles, while the chloride, bromide and iodide of silver are of great importance from their use in photography. Articles plated with silver are in common use, as the cost of plating is small if the film of silver deposited is thin. A solution of the double salt potassium silver chloride (KCN.AgCN) is used, from which the silver is readily deposited. The articles to be plated are thoroughly cleaned, attached to the negative pole of an electrical circuit of low voltage and immersed in the bath, a silver plate being attached to the positive pole. The silver as deposited has a dead surface but is made bright by burnishing after removal from the bath.

In photography silver chloride in a layer of albumen or gelatine is used on the ordinary printing papers; various organic compounds are formed which are changed on exposure to light, and this change is shown by the action of certain reducing agents, developers, the resulting image being formed of unknown silver salts suspended in the gelatine. In bromide prints which are more durable, the image is due to finely divided metallic silver. In the ordinary photographic dry plates, silver bromide or iodide is used in a gelatine film, as these salts are more easily affected by light. See BIMETALLISM; COINAGE; ELECTROCHEMICAL INDUSTRIES; COPPER; GOLD; LEAD; PHOTOGRAPHY.

SILVER, Fulminating. See EXPLOSIVES; FULMINATES.

SILVER, Refining of. See ELECTROCHEMICAL INDUSTRIES.

SILVER AGE, the designation applied to the second mythological period in the history of the world, under the care of Jupiter. It succeeded the Golden Age. The phrase is also applied to a period of Roman literature succeeding the most brilliant period, and extending from about 14 A.D. to 180 A.D.

SILVER CITY, N. M., city and county-seat of Grant County, 185 miles southwest of Albuquerque, on the Atchison, Topeka and Santa Fé Railroad. The city is important as a health resort, particularly for tubercular cases, and has several private sanatoria. The United States military hospital is at Fort Bayard, nine miles distant. The surrounding country is occupied in stock-raising and there are valuable gold, silver, copper, zinc, lead and turquoise mines. The New Mexico Normal School is located here. Pop. 3,217.

SILVER CREEK, N. Y., town in Chautauqua County, on Lake Erie, 20 miles southwest of Buffalo, and on the Lake Shore and Michigan Southern and the New York, Chicago and Saint Louis railroads. It is situated in a vineyard district, has natural gas and manufactures furniture, United States post office canceling machines and grain-cleansing machinery. Pop. 2,512.

SILVER FOX, a glossy black variety of the Canadian red fox (*Vulpes fulvus*) with a silvery grizzle on the forehead, and on the flanks passing upward to the rump. It is extremely rare in the wild state and the fur is very valuable. In Prince Edward Island and elsewhere in Canada and northern United States great numbers of this species are now bred in enclosures and reared for two years, when they are killed for their fur. See FUR FARMING.

SILVER SPRING, Fla., a famous spring in Marion County, 14 miles northeast of Ocala, emptying into Ocklawaha River through Silver Creek Run, a stream nine miles long, of crystal transparency, and of sufficient depth to permit river steamers to navigate to the spring itself. The spring is about 200 feet wide and dis-

charges daily more than 300,000,000 gallons of water of a uniform temperature of 72.2° F. The water rushes up through fissures in the limestone rock, there being five principal openings and many of smaller size, and keeps in constant agitation the bed of white sand. The water is unfit for drinking purposes owing to certain mineral qualities, but is so clear that the bottom of the spring may be seen at depths from 60 to 80 feet. There are several similar springs in Florida, but Silver Spring is most accessible and best known, a railroad running to it in addition to its steamboat connection. The spring is said to have been visited by De Sota, and to have been the "Fountain of Youth" of Ponce de Leon's search.

SILVERMAN, Joseph, American rabbi: b. Cincinnati, Ohio, 25 Aug. 1860. He was graduated at the University of Cincinnati in 1883 and later studied at the Hebrew Union College, where he took his D.D. in 1887. He was ordained in 1884 and was minister to congregations in Texas in 1884-88. Since 1888 he has been rabbi of Temple Emanu-el, New York. He was president of the Central Conference of American Rabbis in 1900-03; organized the Emanu-el Brotherhood; is a trustee of Hebrew Union College; and in 1913 was associate editor of the *Peace Forum*. He contributed to the 'Encyclopedia Americana' and is author of 'Catechism on Judaism' (1896).

SILVERSIDE, a name given to various small fishes because of their bright silvery color and especially to members of the family *Atherinidae* of the order *Percesoces*. These fishes have the third upper pharyngeal bone enlarged, slender and elongated bodies with rather large, easily detached cycloid scales. The spinous dorsal fin is weak and well separated from the soft dorsal, the ventral fins are on the middle of the abdomen and the pectorals at a high level. Most of them are small carnivorous fishes living in schools in shallow bays of the sea, but a few are fresh-water. They are important chiefly as food for other fishes, but several of the larger ones are valued as human food. Fifteen genera and 60 species have been enumerated, most of which are North American. They abound especially in the Gulf of Mexico. *Menidia notata* is the form best known along the coast of the New England and Middle States, where it abounds. It is a delicate translucent little fish of a greenish color, has a conspicuous lateral silvery band and is found everywhere along the shores in large schools. They may be fried to a crisp and eaten whole like smelts. The brook or lake silverside (*Habidesthes sicculus*) is found abundantly in ponds and sluggish streams throughout the Mississippi Valley and Southern States, and is often called skipjack. Consult Jordan and Evermann, 'Food and Game Fishes' (New York 1903).

SILVERWARE. Frequently termed *plate* or *silver plate*. From the nature of the use

to which articles composed of silver are put they are often classified under such heads as ecclesiastical and civil, or ecclesiastical, municipal and domestic. The usual styles of manipulation of the metal in producing silverware are hammered or repoussé, engraved, chased, enameled, etc.

Antiques.—It was a very frequent condition of the troublous early periods of European history that the inhabitants of a castle or small town had to migrate, taking what wealth they had with them. The Roman invaders' generals often carried with them on their campaigns large services of silver for their camp life. Frequently such migratory hordes were attacked and overwhelmed, and, if time permitted, they hurriedly buried their most valued possessions. To such action we owe much treasure-trove and from the "finds" we learn to what a marvelous perfection the ancients brought their silver plate. Among the most important discoveries by accident of such hidden wealth are the following: The "Treasure of Bernay," discovered (1830) at Berthouville, Normandy, contained 69 pieces, weighing about 55 pounds, of beautifully wrought, embossed, decorated silverware. Part belonged to the treasury of a temple of Mercury at Canetum 2,500 years ago. Two ewers (*anochoe*) had chased subjects from the 'Iliad' and the history of Achilles, the Greek hero. One of these pieces contains fine depictions of no less than 42 personages. The collection is in the Bibliothèque Nationale, Paris. The pieces are of different dates—before the Roman Empire up to the 3d century A.D. Another wonderful buried collection of silverware is the "Hildesheim Treasure," now in the Antiquarium Museum, Berlin, discovered in 1868. It consists of 74 pieces; drinking vessels and table utensils, mostly well preserved and belonging, probably, to the 1st century A.D. The decoration is in Greco-Roman repoussé work of the most exquisite description. Replicas of this treasure are in the Metropolitan Museum of Art, New York. Another remarkable silverware discovery was that known as the "Boscoreale Treasure." It was discovered in 1895 in a buried Roman villa near Pompeii. The lovely workmanship and design point to the last years of the republic, some to the first years of the empire. It contains 98 pieces of silverware in beautiful repoussé decoration; cups, vases, phials, shallow dishes, casseroles, spoons, mirrors, etc. A very fertile field of discovery of buried ancient silverware is the Crimea, where a large amount of treasure has been unearthed (mostly now in Petrograd) from burial grounds of the Scythians. They date from 2,500 to 3,000 years ago and are of Greek workmanship.

History.—The story of craftsmanship in the precious metals of the Middle Ages is largely one of furnishing of gold and silver ecclesiastical pieces for the Church and its services. With the growth of wealth of royalty and nobility from lack of banking facilities, much of the saving was turned into gold and silversmiths' work. Starting about the 13th century we find the alms house containing more precious wares of the family. The cupboard consisted of boards placed on trestles to hold and display the wealth in silver cups and other wares of the family. This easily portable

furniture gave way, in times of peace, to a made-up "dresser" of so many "stages" or shelves on which to "dress," or display, the silver services and show-pieces. With greater refinement arrived the "sideboard" or "credence" for the same purpose, to be followed by the "buffet." The number of "stages" kept increasing as the wealth in plate grew, till royalty imposed an edict against the extravagance and restricted the number of shelves according to the rank of the owner. By the 16th century the hoards of plate were enormous. In England Henry VII left over \$10,000,000 worth; the cupboard of Henry VIII had seven tiers of plate; and so it was in other countries, especially Spain. Immense quantities of silver were arriving in Europe from conquered Mexico and Peru; the silver mines of Potosi alone had brought to Spain by 1633 no less than 845,000,000 pesos. Italy in her Renaissance brought forth many great artist-goldsmiths (see **GOLDSMITHING**) but perhaps, her most noted service of silverware is that produced by Benvenuto Cellini. It is in the Pitti Palace, Florence, and consists of 12 tazze, each tazza representing a month in the year. Germany had, in the 16th century, centres for gold and silver smithing at Augsburg and Nuremberg. Her taste was running to quaint forms and decoration such as cocoanut shell and ostrich shells mounted as cups, other standing cups had bodies of pineapple (*ananas*) form, others again were studded with hemispherical or pear-shaped protruberances. Wentzel Jamnitzer, throwing aside the Gothic, often assumed Renaissance tendencies in his remarkable pieces. Mathias Walbaum and Hans Petzolt gained fame for their silversmiths' work in the 17th century; Dinglinger did fine silver work on table centrepieces, etc., in the 18th century. In France, already in the 13th century, Philippe le Hardi granted his silversmith (*argentier*) Raoul letters of nobility. The dukes of Burgundy by the 15th century gloried in amassing great collections of gold and silverware. Louis, Duke of Anjou (14th century), had *nefs*, standing salts, enameled flagons, fountains, *coupes*, goblets, basins, even kitchenware, of silver. In 1360 the city of Paris presented Jean le Bon with a gift of silver vessels. By the 17th century France had become famous for her articles in the precious metals (see **GOLDSMITHING**) and their makers, all pieces to be swallowed up in the melting pot for war purposes. The following century under the regent, Louis XV, Louis XVI and Napoleon, the royal factory of the Gobelins produced magnificent wares in the precious metals. Paul Lamerie, the French silversmith, went to England in 1712 and produced prolifically in London for 40 years. His silver pieces show sober, artistic decoration for a long time, then he gave way to the demand for over-elaboration of ornament, later to come under the sedate ruling of the Greek Classic style. Under the brothers Adam silverware underwent a great reform in the 18th century; tea and coffee urns, ewers, sugar bowls, creamers, etc., came under the influence of the Greek art wares being excavated at Pompeii and Herculaneum. The great rarity of examples of silverware of certain periods is accountable from the fact that warfare, at times, called for all the precious metals available to help out

the empty treasuries. In 1521 François Premier ordered his subjects to send their silverware to the mint. The "grande Fonte" under Louis XIV lasted six months (1688-89) and was the most prodigious in destructive power. Great pieces of massive silver furniture as well as table services (the king's treasure alone had cost over 10,000,000 francs and fetched only 3,000,000 francs in coin) were sacrificed. The year 1760 witnessed once more the journey to destruction of France's best plate, and in 1790 came the voluntary "patriotic fonte." In the Wars of the Roses in England so much plate was destroyed that examples of silver plate antedating 1500 are very scarce. The Reformation (16th century) swept away all the silverware discoverable. Charles I of England, in 1643, to replenish his empty treasury, ordered that all silverware be melted down and paid for at five shillings per ounce; 12 Oxford colleges contributed 1,610 pounds per week, and the gentry 700 pounds each week. Coming down to strictly modern times, we must deplore the fact that 19th century Europe and England in the Victorian period were in a decadent stage in art work and silverware followed the vulgarized styles. France with her "nouveau art" and Germany with her "Jugend" style have struggled but not succeeded in reaching any admirable stage of art production.

Silverware Products.—Ecclesiastical pieces made of silver or silver-gilt are candle-sticks, censers, incense boats, chalices and patens, pyxes, monstrances, bells, crosses, croziers, acolyte standards bearing candles, ewers, cruets, alms dishes, ablution bowls. The chalice is composed of a bowl (usually hemispherical or slightly elongated), a stem having, half way down, a "knop" or protuberance, and a flaring foot. While the bowl is nearly always plain (so as to be easily kept clean), the rest of the piece is elaborately ornamental. In the Protestant Church the communion cup takes the place of the chalice. It is frequently chalice-shaped but more often has the form of a goblet, a tankard or a beaker. The flagons, tankards and beakers found in church plate have frequently been made for profane use, but as articles of beauty and value have been dedicated by will to the Church.

Municipal Plate.—Every guild (from goldsmiths' to tinsmiths') in Europe has its treasure of plate which is displayed on the table at banquets and other civic functions. And the large amount and high quality of the ware found even in obscure towns is often a surprise to the stranger; such property is, however, usually the accumulation of centuries of presents made by the wealthy in each generation. Every town hall (Rathshaus or hotel de ville) has a large array of plate services as well as magnificent show pieces. The colleges pride themselves on their great silver and gold services.

Domestic Plate.—Chief pieces used in the last centuries in domestic circles are ewers, beakers, bowls, caudle cups, cruet stands, flagons, hanaps, tankards, monteiths and other punch-bowls, urns, salvers, posnets, trussing cups, porringers, tumblers, goblets, wager cups, tasters, etc. Earliest forms of coffee pots date from 1670 to 1681; earliest teapots date from 1717; to such services belong, later, creamers, milk pitchers and sugar bowls. Forks at first had two prongs and were used only for eating

fruit; the four-pronged fork came into use first in 1682. Silver spoons of a highly artistic form ("keel and disk") were made in Greco-Roman times. In the study of spoons in the centuries

the style of "knop" or finial of the handle defines the period, besides the changing in shape of the bowl. As to these knop styles, we read in 1446 already of the "maidenhead" spoon; other varieties follow: Acorn, diamond point, fruitlet, writhen, strawberry, death's head, slipped-in-the-stalk, Puritan, scallop-shell, owl, lion-and-shield, Pudsey, seal-top, capital, baluster, pied-de-biche, etc. The 17th century spoon handle was joined to the bowl in a diminishing prolongation down the back of the bowl; this is known as the "rat-tail" spoon. Early spoon bowls run to "fig-shape," then oval, then inclining to be pointed at lower end. Greatly prized of collectors are the souvenir birth-spoons termed "Apostle" spoons, each ded-

not known; first mention is in 1537. The "annual letter" alphabet has but 20 letters—J, U, W, X, Y, Z are omitted. Since 1560 they have been enclosed in regular heraldic shields of various shapes; before then a line roughly outlining the letter was used. The change to another style alphabet has proceeded regularly every 20 years from 1478 till 1696, when a fresh alphabet was used. (4) Place-mark of assay town. (5) Maker's mark—enforced, in England, since 1363 required each silversmith to have a mark of his own. Symbols, emblems or initials were used at first; from 1697 to 1720 the first letter of the surname was used alone, but from the latter date to 1739 one or two initials were used indiscriminately. Then the "initials of their

icated and having as finial a representation of one of the apostles. Actual pieces of art, frequently are the nefs (formed, like ships), epergnes, standing salts (hour-glass salts, cylindrical salts, bell salts, steeple salts, napkin salts, etc.).

"Hall" and Other Marks.—A very important feature to collectors of silverware is the fact that all of it is *marked* since the 14th century by law. In 1313 Philippe le Bel, king of France, ordered that all gold be stamped with the punch (*poignon*) of the Goldsmiths' Company of Paris. The "touche de Paris" in this law became the recognized English standard for sterling silver. Edward I, in 1300, had bestowed the privilege of assaying the precious metals to the London Goldsmiths' Company. Punch marks used on English plate are: (1) Standard—a lion passant in England, a lion rampant in Glasgow, a thistle in Edinburgh, a crowned harp in Dublin. (2) Duty mark—head of reigning sovereign (figure of Hibernia in Dublin). This mark was added in 1874 till 1890, when duties were abolished. (3) Date letter (or "annual" letter). Its starting point is

Christian and surnames" was ordered and continued to this day. In 1675 the law enforced that "all manner of silver vessels be assayed at Goldsmiths' Hall" and be approved by striking each piece with the lion's and leopard's head, crowned, or one of them. From 1697 to 1720 the lion's head erased and Britannia were used instead of lion's head and lion passant.

Sheffield Plate.—The discovery of the process used in the production of this ware was made by a Sheffield cutler, Thomas Boulsover (often misspelled Bolsover), in 1742. He found that a layer of silver could be welded to a copper plate by heat and pressure. He appears to have made only plated buttons and small ware. Joseph Hancock soon advanced the method into the making of table services and larger pieces. The silver fused to the base metal was standard 925 alloy. This early ware was plated only on one side; "double-plating" (on both sides) started some time between 1763 and 1770. To hide the central layer of copper exposed on the edge it was necessary to attach a border or edging. This edging was first produced by placing the copper sides of

two pieces back to back and solder-tinning the edges (1755-85). Cadman then invented the system of soldering on a solid silver edging shaped to fit. The "edgings" of Sheffield plate are one of its chief characteristics. Starting with simple silver ware ("thread") edges or borders, by 1820 highly ornate, heavy, deep relief scrollwork and bold designs became vogue. It is the renowned "Georgian" style. The *flat-chased* large trays and salvers dating between 1815 and 1830 are probably (if in good condition) more prized than any other pieces of "Old Sheff" ware. From 1830 to 1840 is the "transition period" when *German silver* and other light-colored alloys took the place of copper as a base. The enormous demand for fine Sheffield plate ware in the period is easily conceivable when we remember that the great difference in cost brought fine silver services within the reach of many thousands of the middle classes who had been using pewter and earthenware. The beauty of some of the elaborate creations brought about by the immense and profitable sales made the nobility and gentry converts to its prestige, even royalty took to the majestic épergnes, tea and coffee "equipages" (consisting of urns for hot water, tea and coffee) which were more attractive than any solid silverware ever before produced. But the brothers George and Henry Elkington, of Birmingham, invented a method of silver deposition on base metal by electric current. After patient perfection of their process they obtained, in 1840, a patent for the electro-plating process as done at this day. The extremely low price at which base metal pieces could be produced with a precious metal surface of any desired thickness quickly killed the Sheffield plate business and rapidly evolved a great industry.

Colonial Silverware.—Much early silverware found in the New England States was imported from France and England. But the silversmiths of this country grew in number with the increase of wealth of the colonies. Boston and New York were the producers of most of this early American plate, but there were a number of workers in silver (strange to say, many of them were blacksmiths as is shown by contemporary documents) in Connecticut who did very fine workmanship in silver vessels as recent displays of extant 17th and 18th century pieces prove. Philadelphia, Baltimore, Albany and Troy also boasted of their clever silversmiths in those days. Building up a historic outline from researches made recently we are arriving at many interesting points on colonial silver ware and its makers. The earliest Connecticut silversmith recorded appears to be Job Prince of Milford (born about 1680, died about 1703); next comes René Grignon (Huguenot), who settled in Norwich before 1708. Daniel Deshon was Grignon's apprentice and went to New London. Cornelius Kierstead was a New Yorker but (about 1722) worked in New Haven, Hartford, New London, Norwalk and Waterbury. John Hull (1624-83) was a wealthy Massachusetts silversmith and his ability is shown in existing communion cups in the First Church of Boston. He became "Mint master of Massachusetts" and made silver money for local circulation, the British coin being almost entirely absent. He set up (1652) a mint in Boston (disregarding the English Crown's sole right to coin money). Hull got one shilling of every 20

coined. The "Pine-tree" shilling was coined for 30 years and Hull got so wealthy he became a banker as well as silversmith. David Jesse worked in Boston early in the second half of the 17th century—a beaker of his dated 1672 is one of the oldest American pieces existing. Jeremiah Dummer (1645-1718) of Boston has left us a number of pieces. John Cony (1655-1722) also worked in Boston and had as apprentice Apollos Rivoire, who came to Boston from Germany. He had a family of 12, of which the noted patriot Paul was third. The latter started work in his father's shop and was but 19 when his father died (1754). Paul Revere's (the family name was changed) historical career is too well known to repeat here. Many of the Revere pieces exist; 65 pieces appeared in one Boston exhibition (1906). Unfortunately there is little to prove which signed pieces belong to father or son. One very small salt has the inscription "The Illustrious Ninety Two," referring to the 92 members of the house of representatives of Massachusetts who refused their signatures for rescinding the circular letter sent to the sister colonies to all join action. Another piece of historic note is Revere's punch-bowl ordered by the 15 Sons of Liberty, their names, encircling its rim. We have the names of numerous New York silversmiths of early days but their wares have disappeared. Other early silversmiths worth mention are Beach, Ward, Sargeant, Pitkin and Rogers of Hartford, and Merriman, Gorham, Chittenden, Bradley and Brown of New Haven. By 1715 Connecticut citizens were wealthy enough to be buying coffee and chocolate pots, braziers (forerunners of our chafing dish), elaborate urn-shaped loving cups, porringers, patch boxes, snuff boxes, caudle cups, etc. The early pieces (17th century) were few and simple (both church and domestic), beautiful ware; gradually came the advance to more elaborate forms and a greater variety of articles. One cause of a reduced number of extant pieces was the early 19th century prohibition movement which melted down drinking vessels to make spoons out of the metal. Modern American silverware holds its own to the present day compared with that of other lands as has been proven at many World's Fairs. The products of Tiffanys have shown many charming and original creations and the Gorham Company at its Providence shops has made a world-wide reputation with its *martelé* style of ware. This style shows the hammer marks as so many faceted surfaces for lovely reflections.

CLEMENT W. COUMBE.

SILVESTER, or **SYLVESTER**, the name of two popes and an antipope, as follows:

SILVESTER I, Saint. He succeeded Saint Melchiades in 314 and his pontificate lasted till 335. He presided through his delegate at the Council of Nice and is said to have held a council at Rome to condemn the errors of Arius and others. The story of his having baptized Constantine is pure fiction, as it is known that the latter was baptized by Eusebius at Nicomedia. Many churches were built or completed in his reign. During his pontificate the Arian heresy was at its height, against which Saint Athanasius was the great opponent. Consult Döllinger, 'Church History.'

SILVESTER II (GERBERT): b. Aquitania; d. Rome, May 1003. At an early age he entered the monastery of Saint Gerard, in Aurillac, and after laying a foundation for all the sciences cultivated in that age he went to Spain to hear the Arabian doctors and was later appointed by Hugh Capet preceptor to his son, Robert. Otho III, emperor, who had also been his pupil, conferred upon him the archbishopric

of Ravenna in 998; and on the death of Gregory V, in 999, procured his election to the papacy, when he took the name of Silvester. He was a great promoter of learning and a proficient in various branches of science himself, his scientific knowledge procuring for him the reputation of a magician. He composed a number of works, particularly on arithmetic and geometry; and with his own hands made a clock, a globe and an astrolabe. Several of his letters on various subjects were printed at Paris in 1611; but the most complete collection has been given by Du Chesne. He was the first Frenchman to ascend the papal chair. Consult the collected edition of his works edited by A. Olleris (Clermont 1867).

SILVESTRE, sêl'vès'tr, Paul Armand, French author: b. Paris, 11 April 1837; d. Toulouse, 19 Feb. 1901. He studied at the Ecole Polytechnique and in 1870 entered government service in the department of finance, in which he became deputy chief of the bureau. In 1892 he was appointed inspector of fine arts. He became well known as a poet of the Parnassian School, was an art critic and dramatist of ability; and, in contrast to his other work, a contributor of somewhat licentious tales to *Gil Blas* and other publications of that order. Author of (verse): 'Rimes Neuves et vieilles' (1866); 'Les Renaissances' (1870); 'La Chanson ses heures' (1878); 'Le Chemin des étoiles' (1885); (tales) 'La Vie pour rire' (1881-83); 'Gauloiseries Nouvelles' (1888); (dramas) 'Sappho' (1881); 'Henry VIII' (1883); (art criticism) 'Le Nu au Salon' (5 vols., 1888-92), etc.

SILYBUM, a genus of composite plants, the best-known species being the holy thistle or lady's milk. *S. marianum* is a tall plant with large spreading prickly leaves; those near the base are pinnatifid, and spotted with white, stained, according to legend, by drops of the Virgin's milk. It was formerly cultivated in English gardens, not only for ornament, but also for its edible roots, leaves and large, purple heads, surrounded by spiny involucre. It has become naturalized in some parts of eastern North America.

SIMANCAS, sê-mân'käs, Spain, seven miles southwest of Valladolid, on the Pisuerga, is an old walled town. The ancient castle was converted into a record hall, where the archives of the kingdom have been preserved since the reign of Philip II (1563). They comprise 30,000,000 state and private documents, and occupy 46 rooms. The town contains a Roman bridge and the remains of Roman fortifications. It has large interests in cereal, fruit and viticulture in the neighborhood. Pop. 11,000.

SIMBIRSK, sîm-bêrsk', Russia, (1) capital of a government of that name, on the Volga, 576 miles by rail southeast of Moscow, is a well-built town. The chief buildings occupy an eminence overlooking the river; the business portion is lower down, and still farther are the quarters of the poor. There are two Greek cathedrals, gymnasia for children of both sexes, several other mixed schools, a sanatorium, two public libraries, a good theatre and many flourishing benevolent institutions. There is a public garden on Vyennets Hill, and numerous private gardens. Fruits are cultivated and

exported. Fishing is one of the chief occupations. Trade in corn, potash, wool, fruits, woodenware and manufactured goods is considerable. As usual in Russian towns, an enormous business is transacted at the annual fair. Karamzin was born here. Pop. 64,000. (2) The government of Simbirsk contains an area of 19,110 square miles. Its vast plain is watered by the Volga, and is fertile. The higher portions are at the east. The west is traversed by numerous rivers, and the Sura is the principal stream in this section. Its tributaries are not navigable. The forests of the government are quite extensive; there are broad pastures, much arable land, a few lakes and marshes. The climate is very severe, great extremes being the rule. The chief crops are cereals, flax, hemp, tobacco and hay. Fish are abundant. Sulphur, iron ore, salt, ocre, asphalt and building stones are quarried. All kinds of woodenware are made, besides felt goods, nets, ropes, gloves, caps and handkerchiefs. The larger manufactories include woolen mills, tanneries, glass and starch works, wagon and carriage works and flour mills. The value of industrial output in normal years is over \$5,000,000. The exports are grains. Pop. 1,997,400.

SIMCOE, sĭm'kō, John Graves, first governor of Upper Canada: b. Cotterstock, Northamptonshire, England, 25 Feb. 1752; d. Torbay, Devonshire, 26 Oct. 1806. He was educated at Eton and Oxford, and in 1771 entered the army as ensign. He fought throughout the war against the American colonies, and was made a colonel in 1781. Returning to England after Cornwallis' surrender, he entered Parliament in 1790 as member for Saint Mawes, Cornwall; and in 1791, on the division of the Canadas, became the first lieutenant-governor of Upper Canada. He established his capital at Newark (now Niagara) on 8 July 1792 and began his administration with a legislature of seven members. He encouraged the Loyalists from the independent States to settle in the new country and devoted himself to its agricultural development and military defense. In 1793 he set about removing the seat of government from Newark to Toronto, which capital he practically founded. In 1794 he was appointed commandant of Santo Domingo; but returned to England in 1797, where he was promoted lieutenant-general. In 1806 he was appointed commander-in-chief in India, but was taken ill on the voyage out and obliged to return. Consult Scott, D. C., 'John Graves Simcoe' (Toronto 1905).

SIMCOE, Canada, town and county-seat of Norfolk County, Ontario, 40 miles southwest of Hamilton, and eight miles north of Lake Erie, on the Grand Trunk and the Wabash railroads. There are manufactures of woolen goods and of "warping tugs," the land-and-water boats used in the Canadian lumber industry. Pop. 3,227.

SIMCOE, Lake, Ontario, Canada, a lake situated about midway between Georgian Bay and Lake Ontario. It is about 30 miles long and 18 miles wide, and contains several islands. The banks are densely wooded, and good whitefish are found in its waters. It discharges into Georgian Bay through the Severn River. Barrie and Orillia, connected with the Canadian railway system, are the chief towns on its

shores. Its shores witnessed the war of extermination between the Huron and Iroquois.

SIMEON, sĭm'ē-ōn, the second son of Jacob and Leah, and ancestor of one of the Twelve Tribes of Israel, which dwelt to the north of the tribe of Judah. When Simeon and his brethren went into Egypt to buy corn, his brother, Joseph, then chief minister of Egypt, but not yet known to his brethren, insisted on Benjamin, the youngest brother, being brought to him, and detained Simeon as a hostage for his forthcoming. Consult Graf, 'Der Stamm Simeon' (Meissen 1866); Meyer, Edward, 'Die Israeliten' (Halle 1906) and Steuernagel, 'Einwanderung der israelitischen Stämme' (Berlin 1901).

SIMEON STYLITES, stī-lī'tēz. See PIL-LAR SAINTS.

SIMETO, sē-mā'tō, or **GIARETTA**, jārēt'tā, the largest river of Sicily. It flows west and south of Mount Etna into the Gulf of Catania, is 93 miles long, but unnavigable.

SIMFEROPOL, sĭm-fēr-ō'pōl', Russia, capital of the government of Taurida, in the Crimea, on an elevated plain at the foot of lofty hills 40 miles northeast of Sebastopol. It consists of an old and a new town—the former poorly built, and occupied chiefly by Tatars, the latter with a handsome square and regular, spacious streets, and has several churches and mosques, a gymnasium and a large civil and military hospital. Under the Tatars it was known as Ak-mechet; in 1736 the Russians captured and burned it. When the Crimea fell to Russia in 1784 the town received its present name. Pop. 69,666.

SIMIIDÆ, the family which embraces the anthropoid apes. See APE and the names of the animals there referred.

SIMILARITY. In geometry similar figures are those which are mutually angular and have their homologous sides proportional. The homologous sides are those which are adjacent

to the equal angles. Thus the figures ABCD, EFGH are similar if the angle A equals angle E; angle B equals F, angle C equals G, etc., and

$$\frac{AB}{EF} \text{ equals } \frac{BC}{FG} \text{ which equals } \frac{CD}{GH} \text{ which equals } \frac{DA}{HE}$$

The constant ratio of any two homologous sides of similar figures is called the *ratio of similitude* of the figures. Triangles which are mutually equiangular are similar. Two triangles are similar when two angles of the one are equal respectively to two angles of the other; therefore, a triangle is similar to any triangle cut off by a line parallel to one of its sides. Triangles which have their homologous sides proportional are similar. Two triangles which have an angle of the one equal to an angle of the other, and the sides about these angles proportional, are similar. Two triangles

which have their sides parallel or perpendicular, each to each, are similar. If two polygons are composed of the same number of triangles, similar each to each and similarly placed, the polygons are similar. In solid geometry, similar polyhedrons are those whose corresponding polyhedral angles are equal, and which have the same number of faces, similar each to each, and similarly placed. Any two homologous tetrahedrons are similar. Two similar tetrahedrons are to each other as the cubes of their homologous edges, and two similar polyhedrons are to each other as the cubes of their homologous edges; therefore, similar prisms, or pyramids, are to each other as the cubes of their altitudes and similar polyhedrons are to each other as the cubes of any two homologous lines. Similar cylinders of revolution are those generated by similar rectangles revolving round homologous sides. The lateral areas, and the total areas, of two similar cylinders of revolution are to each other as the squares of their altitudes, or as the squares of the radii of their bases. The volumes of similar cylinders of revolution are to each other as the cubes of their altitudes, or as the cubes of their radii. Similar cones of revolution are those generated by similar right triangles revolving round homologous perpendicular sides. The lateral areas, or the total areas, of two similar cones of revolution are to each other as the squares of their radii, or of their slant heights, or of their altitudes, and the volumes of similar cones of revolution are to each other as the cubes of their altitudes, or as the cubes of the radii of their bases.

SIMILE, a common figure of speech, in which two things which have some strong point or points of resemblance are compared. It differs from metaphor by reason that the resemblance between object and image is stated expressly by means of the words *like* or *as*, whereas in the metaphor the resemblance is assumed. Among the most famous similes of masters of literature are "About as much privacy as a goldfish" (Irvin S. Cobb); "Winter, like a cold, unapproachable beauty, retains her character until the lawful season of thaw has arrived" (Goncharon); "Hard as a barren stepmothers' slap" (Lady Gregory); "Distant as the dead" (Schiller); "Tedious as a twice told tale" (Homer); "Fleeting as the wings of sleep" (Virgil); "Black as a crow" (Chaucer); "Hooted at like an old tale" (Shakespeare); "You look at a star from two motives, because it is luminous and because it is impenetrable. You have at your side a softer radiance and a greater mystery—woman" (Victor Hugo). Consult Wilstach Frank J., 'Dictionary of Similes' (6th ed., 1916).

SIMKHOVITCH, *sím-kō'vich*, **Mary Melinda Kingsbury**, American social economist, wife of V. G. Simkhovitch (q.v.): b. Chestnut Hill, Mass., 8 Sept. 1867. She was graduated at Boston University in 1890 and later studied at Radcliffe College and at the universities of Berlin and Columbia. She was married to Dr. Simkhovitch in 1899. She was head worker at the College Settlement, New York, in 1898; at the Friendly Aid House in 1898-1902, and since 1902 has been at Greenwich Village House, New York. In 1907-10 she was adjunct professor at Barnard College, and she was as-

sociate in social economy at Teacher's College, Columbia University, in 1910-13. Since 1912 she has lectured at the New York School of Philanthropy.

SIMKHOVITCH, **Vladimir Gregorievitch**, American economist: b. Russia, 1874. He was educated at the universities of Petrograd, Berlin and Halle, taking his Ph.D. at Halle in 1898. He has been professor of economics at Columbia University since 1904. He is a trustee of Greenwich Village House and is author of numerous articles on economics in English, German and Russian, and of 'Marxism Versus Socialism' (1913).

SIMLA, India, the chief town of a district of the same name in the Punjab, the most important of the hill-resorts and the summer capital of the Indian government, about 98 miles north-northeast of Ambala, 7,156 feet above the sea and since 1903 connected by a mountain railway with the Peninsular Railway system. Simla is situated on a series of wooded hill ridges, covered with deodars, rhododendrons and an innumerable variety of ferns; commands a magnificent prospect of the Himalayas, and has an equable temperature that rarely exceeds 70°. The governor-general and the commander-in-chief annually remove hither with their entire staff from Delhi, and go into residence for six months. All the environs are dotted with picturesque villas, and there are churches, schools, hotels, clubs, banks, etc. The chief schools are the Roman Catholic Orphanage for the children of soldiers, on the model of the Lawrence asylums; the Mayo industrial schools for the orphans of poor civilians; Bishop Cotton's School and the Punjab Girl's School, both for the higher education of the children of well-to-do Europeans. The district of Simla which is entirely surrounded by petty native states, has an area of 18 square miles, of which only about 12 are cultivated. The crops are wheat, Indian corn, ginger and poppy. Efforts are being made to grow hops, tea and cinchona. The neighboring mountains yield lead, iron and slate. This tract of hill country was acquired by the British in 1816, as a result of the Gurkha War and has since been augmented by purchase, lapse and exchange. The first house was built in 1819; Lord W. Bentinck was the first governor-general to select it as his summer quarters. Pop., town, 15,000 (winter), 35,000 (summer); district, 50,000.

SIMMONS, **Duane**, American physician and missionary: b. Glens Falls, N. Y., 1834; d. 1899. He studied medicine privately and went to Japan as a missionary in 1859, but subsequently entered the Japanese government service. He secured leave of absence in 1862-63 and studied medicine at Berlin, and later did much to improve public health in Japan. He founded the Juzen Hospital in 1869 and established a school for Japanese medical students. Reasons connected with his health caused him to return to the United States in 1881, but after 1887 he lived in Japan and devoted himself to the study of Japanese history. His writings on the subject are included in 'Transactions of the Asiatic Society of Japan' (Vol. XIX, 1892).

SIMMONS, **Edward Emerson**, American painter: b. Concord, Mass., 1852. He was

graduated from Harvard in 1874 and studied art in Paris. Since 1892 he has followed decorative painting. Among the public buildings containing his work are the Boston State Capitol, Saint Paul State Capitol, Pierre State Capitol, Criminal Court, New York, Appellate Court, New York, Panama-Pacific Exposition, San Francisco, Library of Congress, Hotel Astoria, New York. He has also decorated the dwellings of J. D. Rockefeller and F. Vanderbilt.

SIMMONS, Franklin, American sculptor: b. Webster, Me., 11 Jan. 1839; d. 1913. He first came into notice in 1865-66, when, at Washington, D. C., he produced several bronze medallions of members of the Cabinet and famous army and navy officers, including Farragut, Porter, Grant, Meade, Sheridan, Sherman, etc. In 1868 he went to Rome, Italy, where he resided for many years. In 1898 he was knighted by the king of Italy. He executed about 100 portrait busts in marble, and about 15 public monuments, including statues of General Grant, William King and Roger Williams in the National Capitol, Longfellow and Soldiers' monuments at Portland, Me., and numerous ideal statues, among which are Penelope, Medusa, Seraph Abdiel, Galatea, etc. The Metropolitan Museum of Art contains his 'Promised Land.'

SIMMONS, Furnifold McLendel, American lawyer and statesman: b. Jones County, N. C., 20 Jan. 1854. He was graduated at Trinity College, North Carolina, in 1873, was admitted to the bar in 1875 and afterward practised at New Bern and at Raleigh. He served in Congress in 1887-89; was collector of internal revenue in North Carolina in 1892-97, and for many years was chairman of the Democratic Executive Committee of North Carolina. Since 1901 he has served continuously in the United States Senate and in 1918 was re-elected for the term 1919-25. He was prominent in the struggle for a partial disfranchisement of the Negroes in North Carolina, and was one of the framers of the Underwood-Simmons Tariff Act.

SIMMONS COLLEGE, located at Boston, Mass. It was founded in accordance with the will of John Simmons, for the purpose of providing education for women in such branches as will enable them to earn their livelihood. It was chartered in 1899 and opened in 1902. The departments of study include household economics, secretarial course, library course, science courses (including general science, preparing for teaching and medical preparatory), horticulture and courses in preparation for nursing. The last two were added to the curriculum in the year 1903-04. The full courses are four years in length, but college graduates and others who have had the academic work can complete the technical courses in one or two years. The course in commercial horticulture can be completed in three years, but a full course of four years is also provided; by arrangement with the Massachusetts Agricultural College at Amherst, Mass., only the work of the first two years of the horticultural course is done at Simmons College; the third or the third and fourth years' work is provided for at the Agricultural College. Besides the four years' course in preparation for nursing there is a one year's course, especially intended for

those who have had college work and also a short summer course. Students are allowed to take single studies from the curriculum from any department, provided they are qualified for admission to the college and fitted to take up that particular study. Each department, however, leads to a definite practical occupation. There are also evening classes in shorthand, typewriting, languages, English, cookery, etc.; the evening work is not correlated in the same manner as the day work, and is mostly taken by persons occupied during the day who wish to improve themselves in studies relating to their occupations. By an arrangement made with the Boston Cooking School, the property and management of that school was transferred to Simmons College, the cooking school being represented by a board of visitors. In accordance with this agreement the college offers a special one-year course in cookery in place of the former normal course of the cooking school, and private practice lessons. The funds of the cooking school become a permanent fund for two scholarships. The college plant comprises Simmons Hall on the Fenway, School for Social Workers, Somerset Street, and eight dormitories. The property of the institution is valued at \$3,150,000, about 66 per cent of which is an endowment fund. The students, in 1918, numbered 1,046; the faculty numbered 121; and the library contained 26,431 volumes.

SIMMONS COLLEGE, Texas, a coeducational institution, founded at Abilene in 1891, under Baptist control. It gives the degree A.B., and its courses include industrial and manual arts and sciences, and agriculture and stock-raising. It has an endowment fund of about \$100,000 and its buildings and equipment are valued at about \$200,000. In 1919 it has 1,035 students, 10 students with the colors and 125 instructors.

SIMMS, simz, William Gilmore, American novelist: b. Charleston, S. C., 17 April 1806; d. there, 11 June 1870. He received a secondary education at Charleston, was a clerk in a chemical house, but turned first to the law, then to literature, published a volume of 'Lyrical and Other Poems' (1827), and in 1829 became editor and a part owner of the *Charleston City Gazette*, which failing in 1833 carried with it his fortune, and necessitated a busy pen. A few of his poems have clung to the anthologies, but he is best known for his works of fiction. Rarely he ventured, and always with failure, to past times and strange lands; but when he laid his scenes in the South and Southwest he was convincing and vigorous; in the Georgia gold fields, in the southern battle-fields of the Revolution, in forest and bayou he conducted bold adventures, described in a manner suggestive of Cooper, though failing in Cooper's constructive skill. 'The Yemassee,' a story of colonial South Carolina, is generally ranked as his best. Before the Civil War he had attained a very considerable reputation, being somewhat read even in Britain and Europe. After the war he found himself out of vogue. He was at one time editor of the *Southern Quarterly Review*. Others of his volumes are 'Martin Faber' (1832); 'Atalantis' (1832), a poem; 'Castle Dismal' (1845); 'Guy Rivers' (1834); 'Richard Hurdis' (1838); 'Border Beagles'

(1840); 'Beauchamp' (1842); 'The Wigwam and the Cabin,' short stories (1846); 'The Partisan' (1835); 'The Maroon' (1855); 'Eutaw' (1856); 'The Cassique of Kiawah' (1860). (See YEMASSEE). Consult Trent, William P., 'William Gilmore Simms' (Boston 1892); Sally, A. S., Jr., 'Life of William Gilmore Simms'; and Wegelin, O., 'List of the Separate Writings of W. G. Simms' (New York 1906).

SIMNEL, Lambert, English impostor and pretender to the throne: b. Oxford, about 1472; d. about 1534. While a boy he was trained by a priest, one Richard Symonds, to personate the claims of the York faction early in the reign of Henry VII. In 1487 he gave himself out as Edward, earl of Warwick, son of Clarence, and sole heir of the house of York. He was crowned at Dublin as Edward VI. Supported by troops furnished by malcontent nobles he landed in England, but was defeated a few days later at Stoke. Henry imprisoned Symonds for life, but gave Simnel a place in the scullery and afterward made him falconer. Consult Bush, W., 'England Under the Tudors' (London 1895); Gairdner, James, 'Henry VII' (ib. 1889); Vergil, Polydore, 'Anglicæ Historiæ,' the most reliable contemporary account.

SIMOIS, sim'ô-is, or **DUMBREK SU**, Asia Minor, a river rising in the Kaz Dagh-Ida and emptying into the Scamander or Xanthus, now supposed to be identical with the Mender. Ancient Troy was partly built upon its banks, and the peak of Samothrace towers above it. It bordered the battle fields of the Trojan War, sung by Homer and other Grecian poets.

SIMON, Joseph, American pioneer: b. 1712; d. Lancaster, Pa., 24 Jan. 1904. Emigrating to Lancaster about 1740, he engaged in the Indian trade, soon becoming prominent in that line and one of the largest landholders in Pennsylvania, his enterprises extending to the Mississippi, while he had an interest in business in the Indian Territory. He supplied the Continental army with rifles, ammunition, drums, blankets and other supplies. A deed given to him and 11 traders 8 Nov. 1768, still preserved in Independence Hall, Philadelphia, records the Treaty of Fort Stanwix, whereby a tract of land comprising the present State of West Virginia was granted to them by all the tribes of the Six Nations. The grant never passed into the hands of the purchasers, owing to Virginia's resistance and the breaking out of the Revolution. Consult Ellis and Evans, 'History of Lancaster County'; Markens, 'The Hebrews in America' (pp. 78-82); 'Publications of the American Historical Society' (Vol. I, pp. 120-122; Vol. IX, pp. 31-32).

SIMON, Joseph, American politician: b. Germany, 1851. He was brought to this country in infancy, and since 1857 has been a resident of Portland, Ore. Admitted to the bar in 1872, he was elected to the city council in 1877, serving for three years. In 1878 he managed the State campaign for the Republicans, and was chairman of the State central committee in 1880, 1884 and 1886. He was State senator 1880-98, and was elected president of the State senate in 1889, 1891, 1895, 1897 and 1898. He sat in the United States Senate 1898-1903.

SIMON, sê-môn, Jules (Jules François Simon Suisse), French philosopher and states-

man: b. Lorient, department of Morbihan, 27 Dec. 1814; d. Paris, 8 June 1896. He was educated at the college of his native town, at Vannes, and in the Ecole Normale, Paris. In 1839 he succeeded Cousin as professor of philosophy in the Sorbonne, but lost this post in 1851 by refusing to take the oath of allegiance to Napoleon III. He was returned to the Constituent Assembly by the department of Côtes-du-Nord in 1848. In 1855-56 he delivered a series of philosophical lectures in several towns of Belgium, and in 1863 he was returned to the Chamber of Deputies for a division of the department of the Seine. He strongly opposed the war with Prussia, and after the revolution of 1870 became a member of the provisional government, and was Minister of Education under Thiers from 1871 to 1873. In 1875 he was elected to the Senate, and member of the Academy. In 1876 he became leader of the Republicans, and was Minister of the Interior and Premier until 16 May 1877, when he was dismissed by MacMahon. He was a consistent advocate of free trade and of liberal principles, and opposed M. Ferry's bill of 1879 for suppressing non-authorized religious bodies. In 1882 he was elected permanent secretary of the Academy of Moral and Political Sciences. He edited various journals, including the *Siècle* and the *Echo Universel*. His chief works include 'Histoire de l'école d'Alexandrie' (2 vols., 1844-45); 'Le Devoir' (1854); 'La liberté de conscience' (1857); 'L'Ouvrière' (1863); 'L'Ecole' (1864); 'Le travail' (1866); 'La politique radicale' (1868); 'La peine de mort' (1869); 'Souvenirs du 4 Septembre' (1874); 'Le gouvernement de M. Thiers' (1878); 'Le livre du Petit Citoyen' (1880); 'Victor Cousin' (1887); 'La femme du XXe Siècle' (1891); 'Quatre portraits: Lamartine le cardinal Lavigerie Renan, L'Empereur Guillaume II' (1896); 'Premiers mémoires' (1900); 'Le soir de ma journée' (1902), etc. He also produced excellent editions of the writings of several great French philosophers, including Descartes and Malebranche. Consult Picot, G., 'Jules Simon: notice historique' (1897); Séché, Léon, 'Figures bretonnes, Jules Simon, sa vie, son œuvre' (new ed., 1898) and Thieme, Hugo P., 'Guide bibliographique de la littérature française de 1800 à 1906' (Paris 1907).

SIMON, Richard, Roman Catholic theologian and scholar: b. Dieppe, 13 May 1638; d. there, 11 April 1712. He was member of the Oratory in Paris, but soon abandoning the order he spent his life as parish priest in his native town and the publication from time to time of his works alone interrupted the uneventfulness of his career. Yet he must be looked upon as the father of modern Biblical science and he went far beyond the authority of Church tradition in handling the origin, authenticity, and interpretation of the Hebrew and Greek Scriptures. Many of his conclusions aroused much bitter controversy in his day and met with the approval of neither the Roman Catholic nor Protestant reader. Although at one time an object of suspicion by the Church authorities, Simon remained a faithful Catholic and died in the Church. His principal publications were 'Histoire critique du Vieux Testament' (1678); 'Histoire critique du Nouveau Testament'

(1693); 'Histoire critique des principaux commentateurs du Nouveau Testament' (1693); 'Nouvelles Observations sur la texte et les versions du Nouveau Testament' (1695). Consult Bernus, 'Richard Simon et son histoire critique du Vieux Testament' (1869); id., 'Notice bibliographique sur Richard Simon' (1882); Cheyne, T. K., 'The Founders of Old Testament Criticism' (New York 1893); Duff, Archibald, 'History of Old Testament Criticism' (ib. 1910).

SIMON MACCABÆUS, sī'mōn māk'ā-bē'ūs, Jewish prince and high priest: d. 135 B.C. He was the second of the five sons of the high priest Mattathias, all of whom became famous in their struggle to free the Jews from Syrian domination. When dying Mattathias exhorted his sons to heed the advice of Simon whose abilities he highly regarded. Simon took an important share in the war for liberation pressed against the Syrians by Judah and Jonathan, and after the death of Judah and the capture of Jonathan he was elected leader. He completed the fortification of Jerusalem, expelled all the Gentiles from Joppa, and after preventing Trypho from entering the country to seize the throne of Syria he sent a deputation to Demetrius II requesting freedom from taxation for Judea. Compliance with this request carried with it recognition of the political independence of the country and the Jews established a new era, dating by the years of Simon. The leadership was made hereditary in his family, thus founding the Hasmonæan dynasty, and a new mintage of coins was begun. Simon strengthened his position by the capture of the city of Gazara, from which he expelled the pagan population, and in 142 B.C. he subdued the garrison at Akra. His reign lasted seven years and was remarkable for its peace and prosperity. He secured the friendship of Rome and the respect and esteem of other foreign powers, and by his own people was made high priest as well as ruler in 141 B.C. In 136 B.C. the country became again involved in war with Syria, and Simon entrusted the command of his armies to his sons, Judah and John, who were victorious. In 135 B.C. Simon and his sons Judah and Mattathias were slain at a banquet given him by his son-in-law, Ptolemy; and his son, John Hyrcanus I, succeeded to the throne.

SIMON MAGUS, mā'jūs, a magician, mentioned in the Acts of the Apostles: b. Sitton in Samaria. He professed to be an æon of an exalted nature, and called himself the supreme power of God. (See GNOSTICS). Struck with astonishment at the miracles of the apostles, and at the effect which followed the imposition of hands, he offered them a sum of money to be endowed with similar powers. His proposal met with an indignant refusal on the part of Peter; and from the fact of Simon Magus being the first person who attempted to traffic with money in spiritual functions and endowments, the term *simony* has been employed to designate such traffic. (See SIMONY). After this Simon traveled through the empire making proselytes, taking as his companion a Tyrian courtesan, whom he represented as Helen of Troy, and sometimes as Minerva, calling her at the same time the first intelligence, or mother of all things. Consult Hastings, 'Dictionary of the Bible' (New York 1902); Schmiedel, P. W. (in 'En-

cyclopædia Biblica,' ib. 1903) and Waitz, H. (in 'Real-encyklopädie für Theologie und Kirche' (Vol. XVII, Leipzig 1906).

SIMONDS, sī'mōndz, **Frank Herbert**, American journalist and author: b. Concord, Mass., 1878. He was graduated at Harvard University in 1900, having interrupted his university course to serve in the war with Spain in 1898. He was Albany correspondent of the *New York Tribune* in 1903-05; and of the *New York Sun* in 1905-08. He returned to New York as a member of the editorial staff of the *Sun* in 1908 and became known as a forceful writer on foreign and domestic politics, his articles on the Moroccan crisis and on the Balkan War firmly establishing his reputation. He became editor of the *New York Evening Sun* in 1913, and in 1915 transferred his services to the *New York Tribune* as associate editor in charge of its editorial page. His articles on the European War appeared in part in the *American Monthly Review of Reviews*. Author of 'The Great War—the First Phase' (1914); 'The Great War—the Second Phase' (1915); 'They Shall Not Pass' (1916); 'Three Years of the Great War' (1917); 'History of the Great War' (Vol. I, 1917), etc.

SIMONDS, Frederic William, American geologist: b. Charlestown, Mass., 3 July 1853. He was graduated at Cornell University in 1875, and was instructor in geology and paleontology there 1875-77. He was professor of geology, zoology and botany at the University of North Carolina 1877-81, and of geology and biology at the University of Arkansas 1887-90. Since 1895 he has been professor of geology at the University of Texas. He is a Fellow of the American Association for the Advancement of Science, the Geological Society of America and of the Texas Academy of Science. He has published the 'Annual Report of the Geological Survey of Arkansas' (1891); 'A Record of the Geology of Texas' for the decade ending 31 Dec. 1896 (1900); 'The Minerals and Mineral Localities of Texas' (1902); 'The Geography of Texas—Physical and Political' (1905); 'The Maury-Simonds Physical Geography' (1908), and numerous papers in scientific journals.

SIMONIDES, sī-mōn'ī-dēz, Greek lyric poet: b. Island of Ceos, 556; d. about 468 B.C. Invited by Hipparchus, tyrant of Athens, to visit that city, he there met Anacreon and Lasus, Pindar's master. After the death of Hipparchus he proceeded to Thessaly, where he won the favor of the Aleuads and Scopads, whose victories in the games he afterward celebrated. Returning to Athens, in a competition for the best elegy upon those who fell on the field of Marathon, he gained the prize over Æschylus himself. Shortly after this he was invited to the court of Hiero at Syracuse, where he remained till his death at the age of 90. He appears to have been a chief favorite with Hiero in a court adorned by the presence, among others, of Pindar, Bacchylides and Æschylus. Poetic conception, pathos and perfect power of expression, in addition to the sweetness which procured for him the surname of Melicertes, are among the chief characteristics of his poetry, though in copiousness, vigor and originality he was surpassed by Pindar. He brought the elegy and epigram to a high degree of per-

fection, and in the dithyramb and triumphal ode he particularly distinguished himself. To Simonides belongs the unenviable fame of being the first who took money for his poems. The best editions of his works are Schneidewin's 'Simonidis Cei Carminum Reliquiæ' (1835); and Bergk's (in his 'Poetæ Lyrici Græci,' Leipzig 1843; 4th ed., 1882; reprint 1914); Smyth, H. W., 'Greek Melic Poets' (London 1900). Consult Croiset, A. and M., 'Abridged History of Greek Literature' (English trans., New York 1904); Christ-Schmid, 'Geschichte der griechischen Litteratur' (Vol. I 6th ed., Munich 1912), and Wright, W. C., 'Short History of Greek Literature' (New York 1907).

SIMONOSEKI, sê-mô-nô-sêk'ê. See SHIMONOSEKI.

SIMON'S TOWN, Cape Colony, South Africa, on the west coast of False Bay, about 22 miles from Cape Town, has a safe anchorage and is extensively fortified. There are a large arsenal, dock yards, naval hospitals and a high school. About \$12,000,000 have been expended on the docks and dockyards. A railway connects it with the interior. Its position lends it considerable military and commercial importance. It has a salubrious climate. Pop. 7,246.

SIMONY (from 'Simon Magus,' Acts viii), a transaction by which something sacred or spiritual is given, or received for a pecuniary compensation, or a temporal benefit. The nature of simony is clearly illustrated in the case of Simon Magus, when it was committed for the first time. Simon was a Samaritan, noted for his skill in magic. Attracted by the miracles wrought by the preachers of Christianity, he adopted the new faith and was baptized by Philip. Later, Peter and John came to the East to minister to the new converts. "Then laid they their hands on them and they received the Holy Ghost." When Simon saw this, he offered them money, saying: "Give me also this power." But Peter said unto him: "Thy money perish with thee, because thou hast thought that the gift of God may be purchased with money." Simony, later, assumed many forms, but it always implies an exchange of some material thing or temporal benefit for something spiritual, that concerns God, principally, as purchased office, or preferment in the Church. The degree of this affiliation as well as the disposition of those who are guilty of this sin account for its several modifications and fall to the province of theologians. The ecclesiastical penalties imposed for simony, according to its degree of perversity, are excommunication; reservation of absolution for the culprit to the Pope; suspension of clerics who are guilty of it; restitution of benefices due to it, and the like. In England, simony has been the subject of secular as well as ecclesiastical legislation, but in the United States it is not a civil offense and there is doubt if it even is an ecclesiastical offense, outside the Catholic and Episcopalian denominations. Consult Phillimore, Sir Walter, 'Law of the Church of England' (2d ed., London 1895).

SIMOOM, si-môom', **SIMOON**, or **SAMUN** (Arabic, *samma*, "hot" and "poisonous"), a noxious hot wind which blows at the period of the equinoxes in most countries bordering on sandy deserts, especially in certain parts of Asia and Africa, where its temperature has

been known to reach as high as 130°. The intense and parching heat, resembling that of an oven, is derived from the hot sands, which, in the deserts of Africa and Arabia, often become heated for a depth of some inches to 200° F. This hot sand is whirled up from the earth by the advancing wind, and the whole air is filled with an extremely subtle and penetrating dust, the effect of which, if breathed freely, is to induce suffocation. The approach of the simoom is heralded by a thin haze along the horizon, which rapidly becomes more and more dense, till it covers the whole face of the heavens. This is followed by fierce gusts of wind, accompanied with clouds of red and burning sand, which are whirled round in rapid gyrations, and so swept onward. Sometimes whole caravans are buried in the masses of sand thus carried along. The simoom generally lasts from 6 to 12 hours and sometimes longer. When the wind blows in squalls death is often very suddenly produced by actual suffocation, and is followed by bleeding at the nose and mouth. Persons exposed to it protect themselves by stopping the mouth and nose with handkerchiefs, and the camels instinctively bury their noses in the sand at its approach. The effects of the simoom are felt in the south of Europe, the hot wind produced in Italy being called the *sirocco*. In Turkey this wind is called the "*samieli*"; in Guinea and Senegambia a similar wind is called "*harmattan*." Winds of similar origin and nature exist in Australia and parts of North and South America. In the southeast of Spain a similar wind is known as the *solano*; while the *krusin*, which generally last for 50 days to two months, blows from the northeast across Egypt. See *HARMATTAN*; *SIROCCO* and *SOLANO*.

SIMPLE STORY, A, the best known of the works of Mrs. Elizabeth (Simpson) Inchbald, was published in 1791 and was a very successful novel. Written somewhat in the stately style of the 18th century and dwelling considerably on character and grand manners, it is none the less a touching and in many respects a moving story. Derriforth, a scholar in Catholic orders and later Lord Elmsford, marries his ward, Miss Milner, after a courtship marked by high breeding, misunderstandings, capriciousness and all but irreconcilable strains of temper. After a happy married life of some years, Lady Elmsford, during the prolonged absence of her husband, elopes with a former lover. Lord Elmsford, a man of stern resolution, vows never to see or hear of his wife or their daughter, Mathilda, again. On the early death of Lady Elmsford, the story resolves itself into a tale of the reconciliation of father and daughter through a long period of years, and the final happy settlement of all troubles. The main characters that have been mentioned and those of Miss Woodley and Mr. Sandford, the chaplain, are well conceived and firmly executed. The novel with its strongly emotional cast, is sometimes regarded as the antecedent of that kind of story of which Charlotte Brontë's 'Jane Eyre' is the most famous English representative.

WILLIAM T. BREWSTER.

SIMPLICIDENTATA, one of the two divisions of the order of rodents (*Rodentia*), embracing those with only a single pair of upper

incisors. It includes all of the rodents except the pikas, rabbits and hares, which are duplicidentate. See *LEPORIDÆ*; *RODENTIA*.

SIMPLICISSIMUS, a German novel, fully titled as 'Der abenteuerliche Simplicissimus, Teutsch, das ist; Aie Beschreibung des Lebens eines seltsamen vaganten, genannt Melchior Sternfels von Fuchsheim' (1668), by Hans Jakob Kristoffel von Grimmelshausen (q.v.), and regarded as the forerunner of modern German novel. 'The adventurous German, Simplicissimus, that is: A Description of the Life of a Remarkable Vagabond named Melchior Sternfels, of Fuchsaim,' as the translated title reads, is a vivid and realistic story of the Thirty Years' War.

SIMPLICIUS, *sím-plīsh'ŭ-s*, a peripatetic philosopher: b. in Cilicia. He was a pupil of Ammonius and Damascius, and taught in Alexandria and Athens during the reign of Justinian. In consequence of the persecutions these philosophers suffered from the decrees of the Christian emperor, seven of them, among whom was Simplicius, sought protection in the court of King Chosroes of Persia. Disappointed in their expectations in the East, they resolved to return, and the Persian king made it one of the articles of a treaty of peace with Justinian, that these philosophers should be exempted from the disqualifications imposed upon all pagans. Among the works of Simplicius are commentaries on Aristotle's '*Categorizæ Physicæ*,' '*De Cælo*,' and '*De Anima*,' and also one on the '*Enchiridion*' of Epictetus. Consult the edition of his works by Schweighäuser (Leipzig 1800); edition of his commentaries on Aristotle's works by Karsten (1865) and Enk's edition of the '*Enchiridion*' (Vienna 1866).

SIMPLIFIED SPELLING. See *SPELLING REFORM*.

SIMPLON, *sím-plòn*, Fr. *sân-plôn* (Ital. *SEMPIONE*, *sêm-pê-ô'nê*), Switzerland, a mountain of the Lepontine Alps, 11,117 feet high, in the east of the canton of Valais. The road that passes over it was regarded as one of the most celebrated engineering works of the early part of the 19th century, but is decreasing in importance since the advent of railroads, and the construction of the Simplon tunnel, affording direct communication between Switzerland, France and Italy. The road commences near Brieg on the Swiss side, and terminates at Domodossola in Piedmont. It was begun in 1800 under the direction of Napoleon, and was completed in 1806. It is 38 miles long, from 25 to 30 feet wide, is carried across 611 bridges, and through a number of great tunnels, rises to the height of 6,578 feet, and has 20 station houses for travelers. The railway tunnel through the mountain from Brieg on the Swiss side to Iselle on the Italian side was commenced in 1898, and the contract called for its completion in five and one-half years, for \$13,413,500. Work upon it was completed in 1906. It is 20 kilometres, 12.4 miles, in length, the longest tunnel in the world, and the third, with Mont Cenis and Mont Gothard, connecting Italy by rail with the adjacent countries. See *TUNNELS*.

SIMPLON TUNNEL, The, an important work of engineering through the Lepontine Alps, designed to afford a better means of com-

munication between France and Italy. It was commenced in 1898, completed in eight years, and is 12½ miles in length. See *TUNNELS*, and consult '*La ferrovia del Sempione*' (Rome 1900).

SIMPSON, Edward, American naval officer: b. New York, 3 March 1824; d. Washington, D. C., 1 Dec. 1888. He was appointed midshipman in the navy in 1840, was graduated from Annapolis in 1846 and served in the Mexican war on the steamer *Vixen*. In 1858-62 he was in charge of the department of naval gunnery at the Naval Academy, commandant of midshipmen in 1862-63 and commanded the monitor *Passaic* in 1863-64, participating in several engagements. He was commissioned commander in 1865; served as fleet-captain of the consolidated Gulf squadron; was present at the fall of Mobile, and received the surrender of the Confederate fleet on Tombigbee River. He became captain in 1870, commodore in 1878 and rear-admiral in 1884. He was retired in 1886, but was president of the United States Naval Institute in 1886-88. He published: '*Ordnance and Naval Gunnery*' (1862); '*The Naval Mission to Europe*' (2 vols., 1873); '*Report of the Gun Foundry Board*' (1885); '*Modern Ships of War*' (1887); etc.

SIMPSON, Sir George, Scottish traveler: b. Loch Broom, Ross-shire, about 1796; d. Lachine, near Montreal, P. Q., 7 Sept. 1860. In 1809-20 he was employed by a London firm in the West India trade, where his ability attracted the attention of the Earl of Selkirk, then head of the Hudson Bay Company, and in 1820 he was appointed to conduct the affairs of the company in America. He united the Hudson Bay Company and the Northwest Company, and became successively governor of the Northern department, governor-in-chief of Rupert's Land and general superintendent of the affairs of the Hudson Bay Company. He planned the expedition of his cousin Thomas Simpson in 1836-39, greatly aided other explorers, and in 1841-42 made the overland journey around the world, claiming to be the first traveler to complete the journey. He was knighted in 1841. He published '*Narrative of an overland Journey Around the World During the Years 1841-2*' (2 vols., 1847). Hopkins, J. C., '*Canada: An Enclopædia*' (Toronto 1898-1900) and Macdonald, A., '*Peace River: A Canoe Voyage from Hudson's Bay to the Pacific by Sir George Simpson*' (Ottawa 1872).

SIMPSON, Sir James Young, Scottish obstetrician and developer of anæsthesia: b. Bathgate, Linlithgow, 7 June 1811; d. Edinburgh, 6 May 1870. He entered Edinburgh University at 14 years of age and took his M.D. there in 1832. His brilliant graduation thesis won him the immediate appointment of assistant to Dr. John Thomson, professor of pathology at the University; and he also engaged in practice in Edinburgh, in which he was unusually successful. In 1839, when he was but 29, he was appointed professor of midwifery at the university. Of a keenly sympathetic temperament he was from the first deeply interested in the reports from America of the use of sulphuric ether as an anæsthetic and late in the year 1846 he witnessed an operation performed by Robert Lister in which the patient was rendered completely unconscious. Simpson soon afterward

made the first trial of it in obstetric practice and upon its proving successful he continued its use and became its enthusiastic advocate. He believed, however, that an improved anæsthetic could be found and in 1847 he established the efficacy of chloroform in this respect, making the first public trial of it in November 1847 at the Edinburgh Infirmary. His advocacy of the use of anæsthetics in obstetric cases aroused from the first a storm of protest not only from the medical profession but on the part of the public and clergy as well. His triumph in its final adoption was materially hastened by the appointment conferred upon him by Queen Victoria in 1846 as her personal surgeon in Scotland and her subsequent treatment by him in childbirth. In 1856 he was awarded the Monthyon Prize of the French Academy of Sciences for his achievements in anæsthetics; he was made a member of practically all the European and American medical societies; and in 1866 he received a baronetcy, the first awarded a physician in Scotland. He made further notable achievements in gynecology, in which he was far in advance of his time. Much of his phenomenal success is credited to his ability to foresee possibilities, an evidence of which occurs in his graduation thesis, wherein he voiced the hope that in the future physicians might be able to inspect the entire body by the "concentration of electric and other lights," an advantage later given by the X-Ray. His family declined burial for him in Westminster Abbey, but a bust of him was placed there. A statue was erected in Edinburgh, but his chief monument is the Maternity and Simpson Memorial Hospital at Edinburgh. In the medical profession he ranks with Harvey, Jenner and Lister. Author of 'Obstetric Memoirs and Contributions' (2 vols., 1855-56); 'Selected Gynecological Works' (1871); 'Anæsthesia' (1871); 'Clinical Lectures on Diseases of Women' (1872); 'Archæological Essays' (2 vols., 1873). A full list of his contributions to medical periodicals is in the index catalogue at the United States Army Surgeon-General's Office Washington, D. C. Consult Duns, J., 'Memoirs' (1873).

SIMPSON, Matthew, American Methodist bishop and educator: b. Cadiz, Ohio, 21 June 1811; d. Philadelphia, Pa., 18 June 1884. He studied medicine and was admitted to its practice in 1833, but in 1834 closed his office and set out as a Methodist itinerant, filling 33 appointments in six weeks' tours. In 1835 he became pastor of the Liberty Street Church, of Pittsburgh, Pa., and in 1837 vice-president of Allegheny College (Meadville, Pa.), and professor there of natural science. He was elected, in 1839, first president of Indiana Asbury (the present De Pauw) University and undertook his work with three professors and 11 students in the four rooms of a hired building. After a successful administration, he resigned in 1858, and became editor of the *Western Christian Advocate*, official organ of his Church for the West. In this journal the editor took decided positions on slavery and other subjects of current discussion. He was elected bishop in 1852; and in 1857, when a delegate to the World's Evangelical Alliance at Berlin, preached in the Garnisonkirche, that being the first instance in which an established church in Prussia had been opened to an Eng-

lish-speaking Evangelical. During the Civil War he was a frequent adviser of President Lincoln. In 1881 he delivered the opening address at the Ecumenical Methodist Conference in London. He was best known for his eloquence, and published a volume of 'Lectures on Preaching' (1879). In his own church he had also a considerable reputation as a parliamentarian and presiding officer. He further published 'Hundred Years of Methodism' (1876); and 'Cyclopædia of Methodism' (5th rev. ed. 1883). A posthumous collection of sermons was edited by George R. Crooks (1885). Of his orations among the best known is that at the funeral of Lincoln. A statue of him was placed in Philadelphia on the edge of Fairmount Park, 2 April 1902. Consult Crooks, George R., 'Life of Bishop Matthew Simpson' (New York 1890).

SIMPSON COLLEGE, coeducational institution of higher education located at Indianola, Iowa. It was founded in 1867 by the Des Moines Conference of the Methodist Episcopal Church, from which it derives most of its support and patronage. Its organization includes seven departments: (1) college of liberal arts; (2) academy and normal courses; (3) the school of business; (4) the school of shorthand and typewriting; (5) the conservatory of music; (6) the school of oratory; (7) the school of art. A summer school is also maintained. The college department offers three courses, classical, philosophical and scientific, leading to the degrees of bachelor of arts, bachelor of philosophy and bachelor of science; these courses are all largely elective, the choice of the student being limited to a certain extent by the degree he wishes to obtain. Graduate work is provided for, leading to the degrees of master of arts, master of philosophy and master of science. Military drill and military science are a part of the curriculum, but are elective, except that drill is required for the men in the first two terms of the freshman year. The academic department offers three courses in preparation for the three college courses; there are two normal courses offered, one of three years, and one of five years, the work of the last two years of the latter course being almost entirely elective. The college is coeducational and there is a dormitory for women on the campus. The students of the different departments maintain a number of literary societies, all of which have their furnished halls. The college athletics are under the control of a joint committee, two members of which are appointed by the faculty, and three by the athletic association. The buildings include College Hall, Science Hall, Ladies' Hall, the administration building, the gymnasium and the Conservatory of Music (erected 1902); grounds and buildings in 1918 were valued at about \$800,000; the library contained 11,000 volumes. The productive funds when last reported were \$261,340; the annual income was \$46,000. The students numbered 600 and the faculty 28.

SIMROCK, zim'rök, Karl Joseph, German poet: b. Bonn, Germany, 28 Aug. 1802; d. there, 18 July 1876. He studied at the university of his native city and at Berlin, and in 1826 entered the Prussian civil service, which he was later compelled to leave on account of a revo-

lutionary poem which he had written. His chief claim to fame is founded on his classic modern rendering of the 'Nibelungenlied' (1827) which has gone through over half a hundred editions. He translated Shakespeare's poems and some of his plays, and published (with Echtermeyer and Henschel) 'Quellen des Shakspeare' (1831). He also published 'Handbuch der deutschen Mythologie' (1853-55); 'Deutsche Volksbücher' (1839-67); 'Heldenbuch' (1843-49), illustrative of the heroic traditions of the Teutonic race and his own 'Poems' (1844). In 1850 he was appointed professor of old German language and literature at Bonn, a post which he held till his death. Consult Hocker, N., 'Karl Simrock sein Leben und seine Werke' (Leipzig 1877) and Schröder, E., (in 'Allgemeine deutsche Biographie').

SIMS, simz, George Robert, English poet and dramatist: b. London, 2 Sept. 1847. He was educated at Hanwell College and at Bonn, and since 1874 has been engaged as a journalist and playwright. His publications include 'Dragonet Ballads' (1879); 'How the Poor Live' (1883); 'Once Upon a Christmas Time' (1898); 'Living London' (1902), etc. His plays include 'The Lights of London' (1882); 'Two Little Vagabonds'; 'In London Town'; 'Scarlet Sin.' Other works are 'Social Kaleidoscope'; 'Ten Commandments'; 'Dorcas Dene, Detective' (1897); 'A Blind Marriage'; 'The Cry of the Children'; 'The Black Stain'; 'Among My Autographs'; 'For Life—and After'; 'His Wife's Revenge'; 'Anna of the Underworld.' He is joint author of 'Lights of London'; 'Harbour Lights'; 'Master and Man'; 'Faust up to Date'; 'Member for Slocum'; 'Golden Ring'; 'Little Christopher Columbus'; 'Gray Mare'; 'The Guardman'; 'The Trumpet Call'; 'The English Rose'; 'Two Little Vagabonds'; 'In Gray Piccadilly'; 'The Elixir of Youth'; 'Romany Rye'; 'My Innocent Boy'; 'Dandy Fifth'; 'Gipsy Earl'; 'Golden Ladder'; 'Hop o' My Thumb'; 'Sleeping Beauty'; 'Puss in Boots'; 'Ever Open Door,' etc. Consult Archer, W., 'English Dramatists of To-Day' (London 1882).

SIMS, James Marion, American surgeon: b. Lancaster County, S. C., 25 Jan. 1813; d. New York, 13 Nov. 1883. He was graduated from South Carolina College in 1832; studied medicine at Charleston and at Philadelphia, and in 1835 began to practise. He was settled at Montgomery, Ala., during 1840-53, where he became known for his successful operations for strabismus and club-foot. In 1845 he made known his hypothesis on the cause and proper treatment of *trismus nascentium*. The effectiveness of the treatment was later demonstrated by a long series of experiments. In the same year he began experiments to test a treatment he had conceived for vesico-vaginal fistula, in the course of which he devised the silver suture and several instruments, the chief of which is the duckbill speculum known as the Sims speculum. In 1853 he removed to New York and shortly began a movement for the establishment of a hospital for the diseases of women. A temporary structure was built in 1855, and a charter and appropriation were granted by the legislature in 1857 for the permanent institution, built in 1866 on the pavilion

system. Dr. Sims went to Europe in 1861 and performed the operation for vesico-vaginal fistula in the hospitals of London, Paris, Edinburgh and Dublin. In 1862 he settled in Paris and secured a lucrative practice. From 1864 to 1868 he practised in London, and in the latter year returned to America. He was again in Paris in 1870, and was surgeon-in-chief of an Anglo-American ambulance corps that treated both French and German soldiers after the battle of Sedan. In 1872 he was reappointed a member of the board of surgeons of the Woman's Hospital, but resigned in 1874. Among his published works are 'Trismus Nascentium' (1846); 'Silver Sutures in Surgery' (1868); 'On Intra-Uterine Fibroid Tumors' (1874); 'Clinical Notes on Uterine Surgery' (1865); 'The Anglo-American Ambulance' (1870); 'Treatise on Ovariectomy' (1873); 'History of the Discovery of Anæsthesia'; 'The Story of My Life' (1884). A bronze statue of him is in Bryant Park, New York. Consult Flint, Austin, 'In Memoriam James Marion Sims' (New York 1886).

SIMS, Thomas M., American fugitive slave, and subject of a celebrated case under the Fugitive Slave Law. He was born a slave, escaped from his master in Savannah, Ga., in 1851 and succeeded in reaching Boston, Mass. He was arrested there 3 April 1851, and was held under the Fugitive Slave Law. The case aroused the abolitionists of Boston and men such as Wendell Phillips, Theodore Parker, William Lloyd Garrison and Thomas W. Higginson were prominent in the effort made to prevent his return to his master. A writ of habeas corpus was obtained after some difficulty, but was set aside, and Sims was eventually escorted to a ship under armed guard and returned to his master in Savannah. He was afterward taken to Vicksburg, and in 1863 he escaped to Grant's army at Vicksburg. He became a messenger in the Department of Justice, Washington, D. C., in 1877.

SIMS, William Snowden, American vice-admiral: b. Port Hope, Canada, 15 Oct. 1858. He was graduated at the United States Naval Academy in 1880, and was promoted through the various grades to captain in 1911, rear-admiral 5 Jan. 1917 and vice-admiral 28 May 1917. He served on the North Atlantic, Pacific and China stations, and was naval attaché at the American embassies at Paris and Petrograd in 1897-1900. In 1901-02 he was aide to the commander-in-chief of the Asiatic fleet; in 1902 fleet intelligence officer and inspector of target practice for the Asiatic fleet on board the *New York*; and in 1908-09 he was naval aide to President Roosevelt. He was commander of the battleship *Minnesota* in 1909-11; and in 1911-13 he served on the staff of the Naval War College, Newport, R. I. He commanded the Atlantic torpedo flotilla in 1913-15. He was appointed commandant of the naval station at Narragansett bay and president of the Naval War College at Newport in 1916. After his promotion to rear-admiral in 1917 he was commissioned special naval representative and observer to Great Britain. After the United States declaration of war on Germany he received command of the United States fleet in European waters, 28 April 1917, his elevation to vice-admiral following on 28

May. He remained in command of the fleet throughout the remainder of the war, and on 23 Feb. 1919, after the withdrawal of the main fleet to home waters was decided upon it was announced by the Navy Department that Vice-Admiral Sims would return to his duties as president of the Naval College. Throughout his career his name was connected with the improvement of naval gunnery and the reform of naval construction; and he was known as a naval writer and critic. His conduct of the United States fleet in European waters during the country's participation in the European War received the highest praise at home and abroad, and he was the recipient of many honors, among them the British Grand Cross of the Order of Saint Michael and Saint George in 1918, and the British Order of Merit in 1919.

SIMS, Winfield Scott, American inventor: b. New York, 6 April 1844. He was graduated at the Newark, N. J., High School in 1861, and served during the Civil War in the 37th New Jersey regiment. After the war he devoted himself to electrical experiments. He constructed an electric motor, which propelled a 16-foot boat at the rate of four miles an hour. He was the first to apply electricity to the propulsion and guidance of movable torpedoes. He also devised a dynamite boat with a speed of 18 miles an hour to be used in harbor and coast defense. He was also the inventor of the wireless-dirigible torpedo, of the Sims-Dudley dynamite gun and a dynamite gun for use with dirigible war ships, and an aeroplane dynamite gun.

SIMSBURY, simz'bér-ī, Conn., village and township in Hartford County, on the Farmington River, 10 miles northwest of Hartford, on the Central New England and the New York, New Haven and Hartford railroads. It has a high school and manufactures safety fuses. Pop. township 2,537.

SIMSON, Robert, Scottish mathematician: b. Ayrshire, 14 Oct. 1687; d. Glasgow, 1 Oct. 1768. He was educated at the University of Glasgow, where he became professor of mathematics in 1711. By the advice of Halley he directed his private studies to the restoration of the ancient geometers. His first labor in this direction was to restore the Porisms of Euclid. In 1735 he published his 'Sectionum Conicarum Libri Quinque,' a work intended as an introduction to the study of Apollonius of Perga. The next object of his labor was the 'Loca Plani' of Apollonius, which he completed in 1738, but which he did not venture to publish till 1749. The restoration of the elements of Euclid was the great object of Dr. Simson's care, and an edition of the 'Elements' was published in 1756, a work which has always enjoyed a high character both for precision in the definitions and accuracy in the demonstrations. The 'Sectio Determinata' of Apollonius next occupied his attention, but this work was not published till after his death when it was printed with the 'Porisms of Euclid.'

SIMSON, Sampson, American philanthropist: b. Danbury, Conn., 1780; d. New York, 7 Jan. 1857. He was graduated from Columbia College in 1800, then studied law with Aaron Burr and was admitted to the bar in 1802. His

professional career was brief, and he preferred the leisurely life of a country gentleman in Yonkers, where his estate was extensive. He was founder of the Mount Sinai Hospital of New York, having presented the ground on 28th street, near Eighth avenue, whereon it was first located as "Jews' Hospital." He also established the still existing "North American Relief Society for Indigent Jews in Jerusalem."

SIMULTANEOUS EQUATIONS, in mathematics, two equations are simultaneous when the value of the unknown quantities which enter them are the same in both at the same time. A group of equations is simultaneous when the value of the unknown quantities is the same in them all at the same time. See EQUATION.

SIN, any wilful thought, word, deed or omission contrary to the law of God. This definition does not cover Original Sin (q.v.), save in so far as it was Adam's own transgression: in distinction from original sin all other sins are called actual sins. Offenses against purely human law may be crimes, misdemeanors, etc., and the same may be called sins; but a sin is not necessarily a crime, no matter how heinous it may be. For example, the most grievous sins may be sins purely of thought or of desire or intention: of these human law cannot take cognizance, and hence they are not crimes or misdemeanors. Sins are variously classed, namely, as of omission and of commission; as against God, our fellow-men or ourselves; as premeditated and unpremeditated; internal and external; mortal and venial. Regarding these several kinds of sin and classifications of sins, theologians of all schools are in agreement, except the last division, that of mortal and venial. The divines of the Protestant churches in the time of the Reformation, while admitting a difference among sins so that some would be more heinous than others, looked on all sins alike as mortal; that is, deserving everlasting punishment. Thus Calvin writes: "The sins of believers are venial, not because they do not merit death, but because there is no condemnation for those who are in Jesus Christ, their sin not being imputed"; even the daily falls of good men make them "liable to the penalty of death before the judgment seat of God" (Calvin, Inot. Chr. iii, 4). In the doctrine of the Roman Catholic Church it is taught that one guilty of sins which in their own nature merit eternal death cannot be in friendship of a holy God; hence a distinction is drawn between sins mortal and sins venial; mortal sins are against the very end of God's law, which is the love of God, and they deserve everlasting punishment; venial sins, the daily falls of good men, do not annihilate the friendship of the soul with God, and grace is still left whereby the sin may be repaired. Consult 'Catechismus Concilii Tridentini'; Hyde, W. D., 'Sin and Its Forgiveness' (Boston 1909); Orchard, 'Modern Theories of Sin' (ib. 1911); Mackintosh, R., 'Christianity and Sin' (New York 1914); Tangueray, 'Theologie Moralis et Dogmatica' (6 vols., New York 1908 et seq.); Tennant, F. R., 'Concept of Sin' (ib. 1913).

SIN OF JOOST AVELINGH, The, the first work of "Maarten Maartens" (q.v.) (1890) (J. M. W. van de Poorten-Schwartz). This

"clever and fascinating study of human motives" at once gained for its author the attention of critics and reading public.

SINAI, *sī'nā* or *sī'nī*, Arabia, a mountain peak rising above the rugged surface of the peninsula which projects between the Red Sea and the Gulf of Suez, on one side, and the Gulf of Akaba on the other. This is the sacred mountain of Biblical fame, where Moses received the stone tablets containing the Ten Commandments. The series of mountains covering the entire peninsula consists of three distinct mountains, which are known individually as Mounts Serbal, Catharine and Umm Shomer, and also by the general name of Sinai. They are respectively 6,750, 8,540 and 8,000 feet high, and penetrated by narrow, deep valleys and ravines, enclosed by perpendicular walls of rock. The numerous caves were the homes of hermits. The mountains stand out in bold relief. There have been many controversies as to which peak might be the "Mountain of the Law," and Mount Serbal now bears that distinction, after much research. At the foot of Mount Musa stands the convent of Saint Catharine. The rock inscriptions, dating from an early era, are interesting. Consult Beke, 'Discoveries of Sinai in Arabia and of Midian' (London 1878); Gressmann, Hugo, 'Mose und seine Zeit' (Berlin 1913); Dillmann, C. F. A., 'Die Bücher Exodus und Leviticus' (Leipzig 1880); Palmer, E. H., 'The Desert of the Exodus' (New York 1872); Sayce, A. H., 'The Higher Criticism and the Verdict of the Monuments' (London 1894); Winckler, Hugo, 'Sinai and Horeb' (in 'Encyclopædia Biblica' (New York 1903).

SINAITIC MANUSCRIPT. See **BIBLE**.

SINALOA, *sē-nā-lō'ā*, Mexico, a state bounded on the north by Sonora and Chihuahua, on the east by Chihuahua and Durango, on the south by the territory of Tepic and the Pacific Ocean and on the west by the Gulf of California. Area, 33,671 square miles. From the Gulf, the land rises gradually to the Sierra Madre Mountains, the principal range in the state. There are numerous rivers, some of which are navigable. An excellent natural harbor is that of Topolobampo, an important railway termination. The district of mines (gold, silver, copper, iron and lead) is in the east and the deposits of metals there are regarded as perhaps the most valuable in Mexico; there, also, the climate is cool, frosts occur frequently and the rainfall is excessive. The low and hot western belt is devoted to agriculture, the chief products being cereals, cotton, tobacco, sugarcane, coffee and fruits. These crops in normal times yield about \$8,000,000 annually, and the cattle industry about \$9,000,000 (value of Mexican "dollar," 0.50). The development of Sinaloa and the west coast of Mexico generally, which, before the revolution broke out in 1911 had been rapid and solid, has been, since then, retarded by the unsettled state of the Mexican west and northwest coast country. However, a steady improvement toward stability and progress was noticeable in 1918. The three chief ports are Topolobampo, Altata and Mazatlán. Interior communication is furnished by the Sinaloa and Durango Railway, and the Kansas City, Mexican and Orient, and by good wagon roads; communication with other coast states and foreign coun-

tries, by the Pacific Mail Mexican International, and other steamship lines. The capital of the state is Culiacán, a town of 22,000 inhabitants, connected by rail with the port of Altata. It has a government palace, cathedral, cotton mills and other manufactures. The largest city in the state, and the chief Pacific port of the republic, is Mazatlán (pop. 27,000), which was built on a small peninsula opposite Olas Atlas Bay. Total population of the state, 317,000.

SINCERE BRETHREN. See **RELIGIOUS SECTS**.

SINCERITY, Order of. See **ORDERS, ROYAL**.

SINCLAIR, Alexander Maclean, Canadian Presbyterian clergyman and Gaelic scholar: b. Glen Bard, Nova Scotia, March 1840. He was educated at the Presbyterian College, Halifax, and was ordained in the Presbyterian ministry in 1866. He held various pastorates until 1907, when he was appointed lecturer on Gaelic language and literature at Dalhousie University. He also gave lectures throughout Nova Scotia. Author of 'A Collection of Gaelic Poetry' (1881); 'Gaelic Bards from 1411 to 1715' (1890); 'Gaelic Bards from 1775 to 1825' (1896); 'Mactalla nan Tur' (1901); 'Filidh na coille' (1901), etc.

SINCLAIR, Sir John, Scottish author and agriculturist: b. Thurso Castle, Caithness, Scotland, 10 May 1754; d. Edinburgh, 31 Dec. 1835. He was educated at the universities of Edinburgh, Glasgow and Oxford, was called to the bar in 1775 but did not engage in practice. He was elected to Parliament in 1780, served with brief interruptions until 1811 and in 1786 was created a baronet. He took an active share in building up the fisheries and in promoting agricultural interests, founded the Scottish Society of Wool Growers in 1791, and the Board of Agriculture in 1793, acting as the first president of both associations, and in that capacity maintained an extensive correspondence with General Washington. The most remarkable work of his life was the compiling of the stupendous 'Statistical Account of Scotland, drawn up from the Communications of the Ministers of the Different Parishes' (21 vols., 1791-99). His other publications include 367 pamphlets and 18 other volumes, among which are 'History of the Public Revenue of the British Empire' (3 vols., 1785-89, 3d ed., 1803-04); 'Code of Health and Longevity' (4 vols., 1807); 'Code of Agriculture' (1819), etc. Consult 'Correspondence of Sir John Sinclair' (2 vols., 1831).

SINCLAIR, May, English author: b. Rock Ferry, Cheshire, 19th century. She was educated at Ladies' College, Cheltenham, and became a writer of verse and fiction. Her first striking success was a novel 'Divine Fire' (1904), which reached a wide popularity in the United States. Soon after the outbreak of the European War she went to Belgium as a nurse. Author of 'Audrey Craven' (1906); 'The Judgment of Eve' (1908); 'The Three Brontës' (1912); 'The Return of the Prodigal' (1914); 'A Journal of Impressions in Belgium' (1915); 'The Belfry' (1916); 'A Defense of Idealism' (1917); 'Tree of Heaven' (1917), etc.

SINCLAIR, Upton, American author and Socialist: b. Baltimore, Md., 20 Sept. 1878. He was graduated at the College of the City of

New York in 1897 and in 1897-1901 was engaged in special study at Columbia University. He assisted the United States government inspection of the Chicago stockyards in 1906; founded the Helicon Home Colony at Englewood, N. J., in 1906, an experiment in social community living which was terminated by the destruction of the buildings by fire in 1907; and was Socialist candidate for Congress from New Jersey in 1906. He founded the Intercollegiate Socialist Society and is a contributor to *Physical Culture*. His time is now chiefly devoted to literature. Author of 'Springtime and Harvest' (1901); 'The Journal of Arthur Stirling' (1903); 'The Jungle' (1906); 'The Overman' (1907); 'The Money-changers' (1908); 'The Fasting Cure' (1911); 'Plays of Protest' (1911); 'Damaged Goods' (1913); 'King Coal' (1917); 'Jimmie Higgins' (1919), etc.

SINCLAIR, William Macdonald, English Anglican clergyman: b. Leeds, 3 June 1850; d. 5 Dec. 1917. He was educated at Balliol College, Oxford, took holy orders and became examining chaplain to the bishop of London, honorary chaplain to the king and in 1889 appointed archdeacon of London and canon of Saint Paul's. He retired from London to a country church in 1911. He has written 'The Psalms in the Original Rhythm' (1879); 'Lesson on the Gospel of Saint John' (1882); 'Christ and Our Times' (1894); 'The Churches and the East' (1898); 'The Church and the Nonconformists' (1902); 'The Authority of Sunday' (1903), etc.

SIND, SINDH, or SCINDE (from *sindhu*, a collection of waters), British India, an extensive territory and division of the province of Bombay, comprising the lower course and delta of the Indus, and bounded on the west and northwest by Baluchistan; northeast by the Punjab; east by Rajputana; and south by the Rann of Cutch and the Arabian Sea; length, north to south, about 380 miles; greatest breadth, east to west, 280 miles. Area of part under British administration, 46,986 square miles. This with the native state of Khairpur makes a total area of 53,031 square miles. The capital is Hyderabad, the chief port of Karāchi, both of which are connected by rail. The seacoast, except at the western extremity (Cape Monza), is very low, being composed of mud-banks deposited from the rivers of the delta, or of low hills of sand blown in from the beach, the whole shore being a dreary swamp, destitute of trees or shrubs, and submerged at spring tides. In the dry season the stiff clay soil, which is strongly impregnated with nitre, bears an abundant crop of gigantic grass, with furze, mimosas and cacti, and affords pasture to numerous herds of buffaloes. West of the Indus the Hala Mountains approach the river at Sihwan and come close to the sea at Cape Monza. Between the former place and Karāchi, on the northwest mouth of the Indus, is a maze of hills, the highest of which reach an elevation of about 1,500 feet, terminating abruptly on the west bank of the stream. The general appearance of Sind is that of a jungly wilderness; spontaneous vegetation takes the place of cultivation.

The climate is dry and sultry. In the upper districts frost is not unknown, and the heat often varies in the 24 hours from 40° to 84°

F. The hot season lasts from March to September, the cold season lasts from October to March; and the changes from the one to the other are so rapid that spring and autumn are not experienced. Sind agriculture is still in a primitive state. In those parts under tillage the land yields two crops annually; the spring crop consisting of wheat, barley, millet, durra, sesamum and other oil seeds, hemp, opium and tobacco; the autumn crop of rice, maize, cotton, sugar and indigo. Rice, wheat and maize form the principal staples, being both extensively used for food and exported. Pulse, pumpkins and other succulent plants are raised, and the date, mango, plantain, pomegranate, lime, citron, tamarind, fig, mulberry, pistachio, melon and grape are among the principal fruits. In moist parts gigantic grasses abound. The wild animals of the country include the tiger, panther, hyena, jackal, wolf, fox, antelope and other kinds of deer, wild ass and wild hog. The domestic animals include camels, buffaloes, horses, sheep and goats. The camels are valuable, both as beasts of burden and as furnishing a rich milk. Their hair is used for making shawls and cloths. The buffaloes are prized for their hides, flesh and milk. From the latter *ghee* is made. This is an important article of traffic in Indian commerce. Birds are in great variety. Fish form a chief part of the food of the poorer people. Venomous snakes, scorpions and centipedes are common.

The Sindians, a mixed race of Jats and Baluchis, are partly of the Hindu and partly the Mohammedan faith. They are well made, and handsome, tall, inclined to corpulence and of dark complexion. The women are noted for their beauty. The Sind language differs little from the Hindi of Upper India, though it is more regular and complete in the inflexions of its nouns and verbs. Baluchi is also much spoken, especially in the districts west of the Indus; and Persian may be considered as the language of the higher orders. The natives are very ingenious as weavers, turners and artisans, and are specially noted for their skill in the production of wooden lacquer work, famed throughout India. The leading Sind textile fabrics are coarse silk, cotton or mixed cloths. The silk goods are woven from silk imported from China and Persia. Sind imports British manufactured goods, sugar, groceries and spices and raw silk. Its exports comprise rice and other grains, ghee, indigo, potash, dried fish, wool, hides. There is a transit trade with the Punjab, Persia and Afghanistan, which has been improved by the Indus Valley Railway. The harbor of Karāchi has been improved at considerable expense, and trade is increasing.

Sind was governed by Hindu rajahs at the time of its invasion by Alexander the Great, but subsequently, after many changes, it became an independent state. It was finally subdued by the Emperor Akbar in 1580 since which period it has always been either nominally or really tributary. In 1739 it fell under the power of Nadir Shah, but on his death it reverted to the imperial sway of Delhi. It was in 1756 presented by the Mogul court as a dowry to Timur Shah Derani, king of Kabul, to which country it was, down to its annexation to British India, deemed subordinate. The country, however, was, during the whole of the 18th and the early

part of the 19th century, a scene of almost constant civil dissension, caused by disputes between the two leading tribes of Baluchis, which led at last to the elevation to power of the Talpur dynasty of the "Amirs." The government under these Amirs was a wholly unchecked military despotism, upheld by a feudal soldiery, supported by their respective chieftains, and estimated to have numbered 102,000 men. The hostility displayed by the Amirs of Sind to the British, during and after the operations against the Afghans, led ultimately to its invasion by British troops, and conquest by Sir C. Napier's victory at Miani, 17 Feb. 1843. It was soon afterward annexed to the presidency of Bombay. Pop. about 3,500,000, of which over 2,600,000 are Mohammedans; 850,000 Hindus; while the remainder consist of Sikhs, Christians and several native sects. Consult 'The Imperial Gazetteer of India' (Oxford 1908); Burton, R. F., 'Sind Revisited' (London 1886); Hughes, 'A Gazetteer of the Province of Scinde' (London 1876).

SINDING, Christian, Norwegian composer, brother of O. L. Sinding (q.v.): b. Königsberg, 11 Jan. 1856. He studied under Reinecke at the Leipzig Conservatory in 1874-77, and later studied at Dresden, Munich and Berlin. He established himself in Christiania as an organist and teacher; and gained also a reputation as a pianist, and as a composer of music characterized by great elegance and charm. His compositions are for the piano and for stringed instruments, and include the Rondo Infinite for orchestra; Violin Concerto in A; Piano Concerto in D Flat; Quintet in D minor; the opera 'Der Heilige Berg' (1910); besides several suites, caprices, studies and sonatas, as well as songs and arrangements of folksongs.

SINDING, Otto Ludwig, Norwegian artist, brother of the preceding: b. Königsberg, 20 Dec. 1842; d. Munich, Germany, 12 Nov. 1909. He studied under Eckersberg in Christiania, under Piloty at Munich and under Riefstahl at Carlsruhe. While his work is on the whole much influenced by foreign study, many of his landscape and genre paintings are typically Norwegian. He also paints marines and religious subjects. Among his works are 'The Surf'; 'From Reine' (Christiania Gallery); 'Struggle at a Peasants' Wedding,' etc.

SINDING, Stefan Abel, Norwegian sculptor, brother of the preceding: b. Trondhjem, 4 Aug. 1846. He took his Ph.D. at the University of Christiania, afterward studying sculpture at Christiania and Berlin. He has worked in Paris, Rome and Christiania and is regarded as the foremost sculptor of Norway. His work is highly original and realistic, and is characterized by superb strength and beauty. A collection of his best work was made by Jacobsen and placed in the Ny-Carlsberg Glyptothek. Among his works are 'The Barbarian Mother' (1882); 'Man and Woman' (1889); 'The Valkyrie' (wood, 1882; bronze, 1908); 'May' (1910); 'Joy of Living' (1913); 'Night' (1916), etc. He has also executed statues of Ole Bull, Ibsen, Björansen and one of himself (1916).

SINE, in *mathematics*, one of the most commonly used trigonometrical ratios of an angle. It is the perpendicular dropped from one end of a circular arc upon the radius of

the other end; or in the case of a triangle a perpendicular from one side of an angle to the other. With the usual notation it is the ratio of the perpendicular to the hypotenuse. The sine of an arc is the sine of the angle subtended by the arc. The cosine is the base line from the angle to the sine. A sine-curve is a sinusoid; a subversed sine is the cosine increased by the radius; a versed sine is the radius (or unity) minus the cosine. In plane triangles the sides are to each other as the sines of the opposite angles; in spherical angles, the sines of the sides are to each other as the sines of the opposite angles. Hence it appears how important the sine is for finding certain parts of triangles, from certain given parts. See **TRIGONOMETRY**.

SINECURE, strictly speaking, an office which has no work attached to it, but generally applied to a political office with liberal salary, and comparatively little to do. In the United States no office is supposed to be absolutely free from actual service on the part of the incumbent, but sinecure offices were formerly very numerous in the English public service. They were used to enrich ministers of state and their families; Sir R. Walpole, for example, presented his son Horace to three or four sinecure places which brought him in a large income. The number of such places has been greatly diminished by modern reforms; the stewardship of the Chiltern Hundreds and some other offices of merely nominal profit are retained, because by accepting one of them a member of the House of Commons is enabled to vacate his seat.

SING SING, N. Y. See **OSSINING, N. Y.**

SINGAN-FU, sē-ngān'foo, a city of north-east China, the capital of the province of Shen-si, near the centre of the province, a few miles south of the Wei-ho River. It lies on one of the principal commercial roads of the empire, and at the head of navigation for large junks on the river. The city is surrounded by well-preserved walls, and contains many objects of historic interest. During the 12th century B.C. it was the capital of China, and the Chinese court retired to this city when the allied powers occupied Peking in 1900. For additional information see **SIAN-FU**.

SINGAPORE, sīng-ga-pōr', or **SINGAPUR**, East India, a British possession consisting of a small island and a strongly fortified seaport city, the capital of the Crown colony of the Straits Settlements, off the southern extremity of the Malay Peninsula, commanding the eastern entrance to Malacca Strait, the chief route to the Far East.

The municipality was founded in 1819 by the East India Company, through the foresight and good management of Sir Stamford Raffles, to whose memory a fine monument has been erected. Since 1824 it has been the capital of the consolidated governments of Singapore, Penang and Malacca. The city is well-built, has a sea frontage of about six miles and a fine harbor with extensive docks and wharves. It has become the commercial entrepôt of southern Asia and the Indian Archipelago, and carries on such extensive transactions that it has been termed "the Liverpool of the East." The port is free to vessels of all kinds and nations, without charges on exports and im-

ports, anchorage, etc., only light dues being payable. Singapore is a coaling station of the British navy, and is defended by forts carrying heavy ordnance, and by submarine mines. The imports from Great Britain comprise cottons (the largest import), iron, machinery, coals, hardware and various manufactures; the exports thither consist of tin, coffee, rice, sugar, nutmegs, mace, sago, tapioca, catechu, gambier, hides, rattans, gutta-percha and numerous sundries. The imports from the continent of Europe and the United States consist of wines, spirits and liquors, manufactured goods, provisions, etc., in exchange for similar commodities to those sent to Britain. Singapore carries on an extensive trade with Calcutta, Madras and Bombay. The annual value of exports from and imports into Singapore, taken together, is \$275,000,000 and upwards, being exceeded by only three other Asiatic ports. The total tonnage, entered and cleared, exceeds 17,500,000 annually. There are a number of fine buildings, as the governor's palace, the city hall, two cathedrals, a museum and library. There is also a fine public park and botanical gardens. A railway has been constructed from Singapore to Kranji, on the Johore Straits. The city is well supplied with water, but in other respects its sanitary arrangements are backward.

The island of Singapore is of rhomboidal shape, about 27 miles long and 14 miles broad; area, 206 square miles. It is separated from the mainland by a narrow strait two miles to one-half a mile in breadth. Its surface is generally undulating, rising in some parts into round verdure-clad hills, the highest of which, called Bukit-Tima or the Tin-hill, rises 520 feet above the sea. Tin smelting is the chief of the settlement's industries, more than half of the world's tin product coming from the smelting works of Pulan Brani. The fisheries also are very productive and give employment to a large number of people. The chief cultivated plants include coffee, pineapples and other fruits, coconuts, aloes, gambier, pepper, indigo, sugarcane, etc. Fruits and vegetables are grown in immense variety and to great perfection. The British settlement dates from 1819 when permission was obtained to build a factory on the southern shore of the island. By treaty in 1824 they purchased for 60,000 Spanish dollars and a life annuity to the Sultan of Johore and his resident officer of 24,000 dollars, the sovereignty and fee simple of the island, as well as of all the seas, straits and islands to the extent of 10 geographical miles (11½ miles) around. The climate is very hot, moist and oppressive. The population is mainly Chinese, with a sprinkling of Malays and East Indians, and about 4,000 whites. Pop. about 235,000, of whom about 193,000 are in the municipality. See STRAITS SETTLEMENTS.

SINGER, Isaac Merritt, American inventor: b. Oswego, N. Y., 27 Oct. 1811; d. Torquay, England, 23 July 1875. He was a machinist, and having spent years of study on the improvement of sewing machines obtained a patent on a single-thread, chain-stitch machine. He established in New York a factory in conjunction with Edward Clarke, a wealthy lawyer, and made a fortune in the manufacture of machines which bore his name. He re-

sided at Paris and Torquay during the later years of his life. The Singer building is one of the notable edifices of New York, and the Singer tower was at one time the highest office building in the city.

SINGER, Isidore, American Jewish editor and author: b. Weisskirchen, Moravia, Austria, 10 Nov. 1859. He took his Ph.D. at the University of Vienna in 1884, and studied also at the University of Berlin. He founded and edited *Allgemeine Österreichische Literaturzeitung* at Vienna in 1884-85; and in 1887 he became secretary and librarian to Count Alexandre Foucher de Careil, French Ambassador to Vienna, whom he accompanied to Paris. He was later employed in the Bureau de la Presse of the French Foreign Office, and subsequently founded *La Vraie Parole*, of which he was editor-in-chief, and made the paper an opponent of the anti-Semitic *La Libre Parole*. He went to Italy in 1891, and in 1895 came to the United States, where he succeeded in carrying out the project he had made his life work, the publication of the 'Jewish Encyclopedia' (12 vols., 1901-05), of which he was the originator and managing editor. He also originated the project of the 'International Insurance Encyclopedia' (Vol. I, 1910); and the 'German Classics of the XIXth and XXth Centuries' (20 vols., 1913-14); and was author of 'Berlin, Wein und der Antisemitismus' (1882); 'Le Prestige de la France en Europe' (1889); 'Russia at the Bar of the American People' (1904); 'Christ or God?' (1908), etc. He is at present literary editor of Joseph A. Judd and Company, and associate editor of *Arts and Decoration*.

SINGHALES, SINGHALESE (sīn-gā-lēz'), **LANGUAGE AND LITERATURE**. Singhalese is the speech of 70 per cent of the native inhabitants of Ceylon. It is an Aryan tongue and nearly allied to Pali, but it contains many foreign words. For this reason there has been much dispute as to its classification. There is a material difference between the vernacular and the written language. The latter has a copious vocabulary and a regular grammar, and is capable of elegant style. Its alphabet has 50 letters, but these represent only 30 sounds (7 vowels, 23 consonants), belonging to the Singhalese. Modern Singhalese has become an analytical language very largely, though there are still in evidence traces of its highly inflected ancient condition. In fact the Singhalese verb seems to have been handed down little changed from the synthetic age of the tongue. The other sounds are heard only in Sanskrit words or are indistinguishable. In the Singhalese words occurring in the following illustrations of the grammar of the language the vowels have the values they have in Italian, the consonants, including *ch*, *sh* and *j* have the sounds given to them in English, except that *g* is always hard, and that the diphonics *chh*, *jh*, *th*, *dh*, *ph* and *bh* stand for sounds peculiar to Singhalese. In Singhalese grammar there are three genders; nouns masculine end mostly in *a*, plural *o*, *an*, *aru*; feminine in *i*, plural *u*, *varu*; neuter in *a*, *u*, plural adding *val*, or dropping the final syllable. Examples: *nuvara*, city, *nuvaraval*, cities; *kaduva*, sword, *kadu*, swords. The principal case endings, masculine and feminine, are genitive, *ge*, *ne*; dative, *ta*, *da*; accusative, *va*; ablative, *gen*, *nen*. The neuter

1 Street scene in Singapore

2 Malay Court of Justice, Singapore

endings of the above four cases respectively are *ē*, *ata*, *ava*, *en*. Example: *manuspaya* (Lat. *homo*), man; *gūnī* (Lat. *mulier*), woman; *oluva* (Lat. *caput*), head; genitive *manuspayaḡe*, *hominis*; *gūnigē*, *mulieris*; *oluvaḡe*, *capitis*; dative, *manuspayaḡ*, *hominī*, etc.; accusative, *gūntva*, *mulierem*, etc.; ablative, *oluvēn*, *capite*, etc., as above detailed: plural, *manuspaya*, *homines*; *alu*, *capita*; *manuspayinnē*, *hominum*, etc. The adjectives are indeclinable. There are no less than 14 different pronouns of the second person, the use of them being regulated by the rank, both of the speaker and the person addressed. The Singhalese literature, which is not very extensive, comprises several original poems of some merit, and an extensive and interesting series of native chronicles, together with a considerable body of devotional works and other religious writings. The oldest Singhalese document extant is a glossary to the commentary on the 'Dhammapada' (10th century). The language also contains histories and grammars. The sacred books of the Singhalese, originally written in Pali, and which have been translated into the popular tongue form a considerable body of literature which is widely read and distributed over most of the island. Consult Alwiz, 'Singhalese Hand-Book in Roman Characters' (Colombo 1880); Carter, 'English-Singhalese Dictionary' (Colombo 1891); Clough, 'Singhalese-English Dictionary' (Colombo 1890); Geiger, 'Literatur und Sprache der Singhalesen' (Strassburg 1901); Gunasekara, 'Comprehensive Grammar of the Singhalese Language' (Colombo 1891).

SINGHARA NUT, the fruit of a floating aquatic plant *Trapa bispinosa*. The nut is large, about three-quarters of an inch thick, having normally four spines, two of which are often absent. It has a sweet starchy kernel, which is a staple food of the natives of Cashmere.

SINGING. See VOICE AND VOICE CULTURE.

SINGLE STANDARD. See BIMETALLISM.

SINGLETAX, The, is a name for the social reform which Henry George proposed in 'Progress and Poverty.' This book was first published in 1879, but the social reform it proposes had been foreshadowed by its author in his monograph, 'Our Land and Land Policy,' published in 1871. He had discussed it, also, in newspaper editorials and magazine articles, and had subjected it to criticism through extensive personal correspondence. Having satisfied himself of the economic and moral soundness and the political feasibility of the reform, he devoted his life, from the beginning of his task of writing 'Progress and Poverty' in 1877 until his death in 1897, to popularizing it and to promoting political action in furtherance of its legislative adoption. In the course of this agitation he wrote several additional books only less famous than 'Progress and Poverty,' among them being 'Social Problems,' 'Protection or Free Trade,' an open letter to Pope Leo XIII on 'The Condition of Labor,' 'A Perplexed Philosopher' (a criticism of Herbert Spencer in certain respects), and a posthumously published incomplete treatise, 'The Science of Political Economy.' In addition he carried his agitational work to the lecture platform, making two tours of Great Britain and

Ireland, one of Australasia, and several through the United States and Canada. As an editor he advocated the reform first in the San Francisco *Post* (a daily newspaper) and later in the New York *Standard* (a weekly), both under his own proprietorship; and as a magazine contributor he discussed it in the *Popular Science Monthly*, the *North American Review*, the *Century Magazine*, the *Arena*, and periodicals of similar character in the United States and abroad. His political activities—including two gigantic campaigns for mayor of New York (1886 and 1897), in the latter of which he suddenly died a few days before the election, were inspired and rigidly governed, like his authorship and his editorial work and lecturing, by his devotion to the Singletax.

Coming first into use in 1888, this name is the one now best known in the United States, Canada and Australasia. It had currency in Great Britain for a time, but the more familiar term there has for several years been "taxation of land values." In Germany the current name is "Bodenreform." Numerous other designations have been used; "land restoration," "anti-poverty," "free soil," "land and labor," etc. None of them all, however, is satisfactorily descriptive. Although the reform they designate involves alterations in the prevailing systems of land tenure, it is more than a land-tenure reform; while it would begin (partly for strategic reasons) with land-value taxation, and notwithstanding that (for more substantial reasons) this method may be advocated as a permanency, yet the reform itself has no fiscal limitations; whereas the tax proposed would by a single tax, the essential character of the reform is neither the tax nor its singleness; and although the reform aims at abolition of involuntary poverty and of exploitation of labor, its fiscal method for attaining these ends is one of its characteristics. To understand the Singletax, therefore, recourse to verbal definitions of its names will not do. Its essential principles and its distinctive method for their realization in public policy and law, must be taken into account and considered together.

The primary social-utility principle of the Singletax, as formulated by Henry George, is "association in equality." This is referred to as the natural law of progress. Without association progress would be impossible; without equality of opportunity to live and to earn, the progress which association produces reacts injuriously upon itself and engenders poverty as a social phenomenon.

The secondary social-utility principle of the Singletax proceeds logically from its primary one. Equality of opportunity to live and to earn being inconsistent with monopoly of natural resources, *equal rights to natural resources* (which are comprehended in the economic technical term "land") is an unescapable condition of social progress without social poverty. It is also imperative as a condition of the social morality that is implied by such phrases as "the brotherhood of man," and which, finding religious expression in the Golden Rule of Christian teaching and "the Second Great Commandment" of Christian and Jewish teaching alike, gets political expression through the human equality clauses of the American Declaration of Independence.

Inasmuch, then, as the requirements of social morality and social utility coincide in this respect, the broad basic principle of the Singletax is a co-ordination of social utility and social morality principles. It demands *equal rights to land*.

But the basic principle of the Singletax is not necessarily inconsistent with individual titles to land. Whatever is socially useful in a public policy that recognizes individual titles may be harmonized in practice with the principle of equal rights. Any community could harmonize the two for itself, by socializing the land values within its jurisdiction. Instead of attaching equality of rights to the land directly, it could do so indirectly by socializing such of the profits of the whole area as are fairly attributable to its superior natural qualities and locational advantages. Nor would this be a difficult matter. Separation of the profits of mere ownership of natural opportunities from the profits of their use is practicable by reference to the principle of Ricardo's law of economic rent. This law affords an approximately accurate and substantially fair measure of the difference between the incomes that land users earn, whether they are landowners or not, and incomes or other financial benefits from mere ownership. For it measures with reasonable accuracy the varying financial advantages of natural resources through every gradation, from the zero value of superabundant fertile land at social frontiers to the fabulous values of rich mineral deposits easily accessible to markets and the choicest sites for business operations in a metropolitan city. These financial advantages, whether estimated as annual values or as capital values, are "land values" in Singletax terminology. To *socialize land values* is, therefore, the Singletax method of securing equality of rights to land without abolishing any of the socially useful attributes of private titles.

Nor need the reform be made abruptly, or through novel modes of land administration, so as to shock a socially useful conservatism or any reasonable sense of social prudence. It can be established by a deviation from present fiscal principles and policies, with hardly any alteration of present fiscal methods. This is the point at which taxation principles and policies enter into the Singletax. Though considered as a fiscal reform alone, the change proposed would be in the direction of simplicity and greater fairness. It consists in so modifying real estate taxation as to exempt improvements, leaving land values to bear the burden. This modification would not of itself socialize all land values, the entire amount of real estate taxation being less annually than annual land values; but besides socializing more land values than are socialized now, it would discourage monopoly of idle land by increasing the taxation expense of keeping it idle. And it would encourage the improving of land by lessening taxation expenses of improvement and maintenance. It would, therefore, tend toward the social aims of the Singletax. This tendency would be accelerated if all personal taxes for revenue were abolished. Taxes for police regulation are not within the purview of the Singletax, though objectionable as being the most unfair and least effective of regulation methods. But with land values as the sole

source of public revenues, industrial activity would be doubly stimulated: first, by freedom from tax burdens; second, by the lowering of capitalized values of natural resources through market gluts of idle land taxed out of useless and obstructive ownership. The second of those causes of industrial stimulation would be progressively intensified by the forcing upon the real estate market of still more and better idle land, consequent upon the necessity, in order to derive public revenues exclusively from land values on a falling market, of increasing the rates of taxation on capitalized land values. This action and reaction—lowering of capitalized values of land by market gluts of idle land, and consequent raising of tax rates—might result in drawing approximately all land values into public treasuries. In that event and so long as the condition continued, land values would be wholly socialized. If, however, any considerable amount remained continuously unsocialized, extensions of public functions and further improvements in public service could be made at the expense of land values until their socialization was approximately and permanently complete. To *abolish all taxes save upon land values* (in itself a beneficial tax reform) is, therefore, the *method* of the Singletax for securing all its social objects.

To summarize in inverse order of statement, the singletax is a proposal to (1) *abolish all taxation save upon land values*, for the purpose (a) of improving taxation in the direction of simplicity and fairness and in the interest of industry, by (b) exempting production from taxation, and (c) promoting tendencies toward socialization of land values; its purpose in aiming to (2) *socialize land values* being to secure (3) *equal rights to land* in harmony with individual possession, and thereby to establish (4) *equality of opportunity* to live and to earn, impossible under land monopoly but an unescapable condition of progress without poverty under the law of (5) *association in equality*, which is a natural law of (a) social utility and (b) social morality.

Objections to the Singletax are too numerous for complete consideration here. Some are frivolous, some are disingenuous, some proceed from misapprehension; but some are sincere, important and at least apparently reasonable. Most professorial economists are counted among objectors, and the economic atmosphere of the universities seems to be hostile. Yet the objections lack both system and comprehensiveness. Most comprehensive of all, perhaps, are those of Walker's 'Land and Its Rent,' a book which had vogue for a time but is now obsolete. It has been succeeded in university circles by a chapter on "The Single Tax" in Seligman's 'Essays on Taxation.' This chapter, which is limited to the subject in its fiscal aspects, is refuted in chapter XIV of Shearman's 'Natural Taxation.'

Following is a summary of current objections and answers: (1) *Objection*: The Singletax would take private property for public use without compensation. *Answer*: As land value is attributable not to individual industry but to social progress, and attaches not to industrial products but to natural resources, it is in fairness social property, for which reason the just objection is not to taking land value for public use without compensation to land-

owners, but to allowing its continued appropriation by landowners without compensation to the public. (2) *Obj.*: The fiscal principle upon which the Singletax rests, that of taxation in proportion to individual benefits derived from government, is false, sound fiscal principles requiring taxation in proportion to each taxpayer's ability to pay. *Ans.*: (a) Taxation in proportion to ability to pay is a principle of arbitrary tribute-levying; (b) the sound fiscal principle under democratic government is in proportion to governmental benefits. (3) *Obj.*: Taxation in proportion to governmental benefits is impracticable, the benefits being too multifarious and subtle for financial measurement. *Ans.*: (a) As land values financially reflect all governmental benefits, taxation of land values is in proportion to benefits; (b) it is, at any rate, in proportion to financial benefits, which is the crux of the matter. (4) *Obj.*: The tax would be shifted from landowner to tenant in higher rent. *Ans.*: This is (a) unthinkable with reference to unimproved land, and (b) since unimproved land would glut the market under pressure of burdensome taxation, all land would tend downward in market value. (5) *Obj.*: Unimproved building sites do not need the governmental protection that police and fire systems provide and which buildings do need; therefore, upon the principle of taxation according to benefits, building sites rather than buildings should be exempt from taxation for police and fire protection. *Ans.*: As the value of building sites is higher with police and fire protection than without, and the value of buildings is no higher (probably lower from the greater competition in building), it is building sites, not buildings, that are benefited financially by fire and police protection, and which, therefore, should bear the financial burden. (6) *Obj.*: The Singletax would produce public revenues in excess of public needs. *Ans.*: Probably not, if schools, highways and other public necessities and conveniences were adequately provided and properly maintained. (7) *Obj.*: The Singletax would lack elasticity and therefore be unadaptable to balanced budgets. *Ans.*: (a) This possibility of disadvantage would be outweighed by manifest advantages; (b) it might be obviated by estimating public expenditures after instead of prior to collection of the public revenues out of which they are paid; (c) estimates of aggregate land values for a fiscal year in advance of expenditures are as trustworthy for budget purposes as estimates of any other taxable values or of all together; (d) some Canadian municipalities have for several years balanced their budgets under a policy of land value taxation alone, and with apparent satisfaction for they have been legally at liberty to abandon the policy at the beginning of every fiscal year; (e) the problem of balanced budgets is the same with governments as with individuals, namely, to balance expenditures and savings in normal circumstances against normal incomes (in emergencies anticipating future income by drafts upon savings and by temporary borrowing), and as land values are essentially social property and therefore the normal income of governments, expenditures in government budgets should balance against land values. (8) *Obj.*: The Singletax would yield insufficient local revenues for the local

needs of poor communities. *Ans.*: (a) The land values of every community are sufficient for strictly local needs; (b) the maintenance of local schools, highways, etc., are not properly local expenses, these services being necessary to maintain the standards of State and national life as a whole. (9) *Obj.*: The Singletax would exempt investors in labor products while taxing investors in land values, though both investments increased in value. *Ans.*: The latter would be taxed because their investments are in values that are produced, maintained and increased by the community and which attach to the site of the community, a common heritage the title to which investors hold as a government privilege; whereas the investments of the former are in products of industry the title to which investors hold from the producers. (10) *Obj.*: All values are produced, maintained and increased by the community. *Ans.*: The statement is not tenable; but irrespective of that, the values of labor products attach to objects of individual production, whereas land values attach to the natural resources and sites of production and of life. (11) *Obj.*: Labor products are no longer objects of individual production, individuals being unable alone to produce anything in our highly specialized industries. *Ans.*: This objection springs out of confusion of thought, specialized and individual industry not being essentially different, since every specialist contributes his labor individually so that though millions co-operate to produce, for instance a house, each individual is a housebuilder to the extent of his specialized contribution to the result. (12) *Obj.*: The Singletax would be class taxation. *Ans.*: (a) To take by taxation for public revenues property that is legally owned by one class but which morally belongs to all, would not be class taxation but common taxation; (b) it is exemption of such property, either in whole or in part, thereby necessitating taxation of legitimate private property, that is class taxation. (13) *Obj.*: It is impracticable to distinguish land values from improvement values. *Ans.*: (a) Not with reference to unimproved land; (b) unimproved land affords a reasonable basis for calculating the land value of neighboring improved land; (c) the land value of building lots is easily distinguishable with approximate accuracy from the value of their buildings; (d) the value of mineral deposits is easily distinguishable with approximate accuracy from the value of their operating plants; (e) the land value of farms is as a rule so low, relatively to their improvement value, that error would usually be negligible; (f) literal accuracy of calculation is no more vital to this fiscal policy than to any other, and (g) unavoidable error would be less unfair to taxpayers and less injurious to the community. (14) *Obj.*: The Singletax would relieve great moneyed interests by placing all governmental expenses upon landowners. *Ans.*: (a) No land would be taxed unless it were valuable irrespective of its improvements, and (b) valuable land would be taxed only in proportion to its value irrespective of its improvements; (c) as moneyed interests depend for wealth and social power not upon money literally but upon titles to mineral deposits, natural forests, highways, public utilities, building sites, water powers, extensive areas of farming and

grazing land and other legal privileges most of which are land monopolies, they would be more heavily taxed than they are now, while (d) landowners who are also land users (working farmers, for instance) would be taxed less heavily than now. (15) *Obj.*: The Singletax would not benefit wage-earners. *Ans.*: (a) By making the holding of land out of use unprofitable and the use of land profitable the Singletax would stimulate demand for wage-earners, thereby promoting a tendency to steady employment at increasing wages, and (b) by discouraging monopoly of idle land it would tend to make such land common, thereby expanding and maintaining opportunities for profitable self-employment. (16) *Obj.*: To take all land values for public revenue, whether by taxation or otherwise, would be unjust and justice is the prime consideration. *Ans.*: (a) The Singletax stands or falls by the test of justice; (b) as land is a common heritage which cannot be continuously monopolized without continuous injustice to the landless, irrevocable titles to land are indefensible; (c) as any private titles to land are defensible only upon the ground that social utility requires private possession, land titles are in the nature of public trusts which are violated when possessors interfere with the best use of the lands they so possess; (d) such possessors are therefore in justice estopped from objecting to land value taxes that would encourage best use; (e) as land values are in the nature of community earnings, private ownership of land values cannot in justice be granted in perpetuity; (f) as private title to land and private ownership of land values are dependent upon arbitrary governmental grants and not upon moral sanctions, these grants are in justice subject at all times to revocation, revision or exclusive taxation; (g) as it is both impolitic and unjust for governments to tie up their fiscal powers in perpetuity, land titles are at all times subject, both as matter of public policy and as matter of social justice, to taxation in governmental discretion; (h) to assert that land grants cannot justly be revised, revoked or taxed by general rule without compensating grantees or their successors, is in effect to assert that it cannot justly be done at all, for just rights to compensation rest necessarily upon just rights to that for which the compensation is exacted.

Fiscal measures tending toward the Singletax have been adopted for local purposes in several countries, beginning with New Zealand. This instance dates back to a period just before the publication of Henry George's 'Progress and Poverty' but several years after the publication of his 'Our Land and Land Policy.' It came about under the leadership of Sir George Grey, who subsequently declared himself to be in full sympathy with 'Progress and Poverty.' As with nearly all the instances that have followed it, the New Zealand reform was not called the Singletax nor adopted as what would now be so known. But it involved the same principle and in degree the same socializing purpose. This may be said also of the land-value fiscal system which has been adopted for local revenue purposes by municipality after municipality in New Zealand since 1896 until they aggregate nearly a hundred, including Wellington and Christchurch. It may be said

also of the municipal systems of Australia, in which taxation for local revenues varies from rising percentages on land values to land values exclusively. In the German colony at Kiaochow, China, a system of public revenues from land values exclusively was adopted in 1899. Though crude and complex in comparison with the Singletax, this system accords with Singletax principles both fiscal and social. It is supposed to have suggested the "unearned increment" taxes of Germany and the preceding local systems of land value taxation in German municipalities that originated in 1893, both of which, also crude and complex in comparison with the Singletax, have Singletax tendencies and somewhat of the Singletax motive. Although the British measures of 1909 for land value taxation were not Singletax measures distinctively, nor at all except in minor degree, they were supported by Singletax organizations, and were denounced as Singletax measures by the opposition. Some of the municipalities of Canada have made pronounced advances toward the Singletax as a fiscal reform, Vancouver taking the lead in 1905. Although these advances were not made in the Singletax name, they were promoted by Singletax agitation; and while the tax limits are too low to effect the socializing purposes of the Singletax, its fiscal desirability seems to have been demonstrated by the fact that the municipalities, being free to abandon the system with every recurring fiscal year, nevertheless readopt it annually. In the Scandinavian countries influential agitations toward the Singletax have been reported, notably in Denmark where a general small farmers' movement, the "Cottagers," has promoted a strong, favorable policy. In South America, especially in Argentina, the singletax appears to have the support of popular governmental influences; and much in the revolutionary proposals in Mexico indicates a drift toward Singletax ideals there.

"Local option" or "home rule" in taxation — such as is freely allowed to Canadian and Australasian municipalities, and less freely in Germany — has been a favorite method of Singletax agitation in the United States since 1889, when it was proposed by Thomas G. Shearman and approved by Henry George. The earliest efforts in its behalf were made in the New York legislature in the early '90's but without success. Among more recent efforts two unsuccessful referendum campaigns in California (1912 and 1914) are notable. The issue of each was "home rule" in municipal taxation, but the controversy turned upon the Singletax because it was popularly understood that if "home rule" were granted it would be followed by Singletax agitations for local revenue purposes. The favorable vote was large on both occasions and larger on the second than on the first. Oregon established "home rule" in county taxation by referendum in 1910, the popular issue being Singletax; but at the election of 1912 a Singletax referendum for the State was defeated, and the "home rule" measure adopted two years earlier was repealed before it had gone into practical operation. At the same election Singletax proposals under the "home rule" provision of 1910 were defeated in three counties — Clackamas, Coos and Multnomah. Colorado, where a county "home rule" amendment to the constitution was defeated in 1902, has since estab-

lished a "home rule" system under which four municipal referendums have come off—one in Denver, one in Colorado Springs and two in Pueblo. In Denver and Colorado Springs Singletax measures were defeated; in Pueblo one was carried in 1913 but repealed in 1914 before it had gone into practical operation. As early as 1895-96 the question was raised before the people of Delaware on a Singletax amendment to the constitution, but was defeated after an exciting campaign. The people of Missouri voted in 1912 on constitutional amendments establishing the Singletax by stages over a period of several years, and defeated them by an enormous majority, the favorable vote being 86,647 in a total of 594,784 throughout the State, and 47,583 in a total of 112,408 in the city of Saint Louis. Singletax referendums in Everett, State of Washington, have resulted favorably, but are as yet ineffective under constitutional objections. Tax Commissioner Pastoriza of Houston (Texas) made Singletax innovations by common local consent, as matter of arbitrary administration; and for fiscal purposes the system is to some extent in administrative operation in the State irrigation districts of California. The earliest distinctive Singletax experiment in the United States was begun at Hyattsville (Md.), a suburb of Washington, D. C. Taking advantage of a State law permitting municipalities to attract industrial enterprises by exempting them for a time from taxation, the Hyattsville council adopted the Singletax for local revenue purposes in 1892, but its action was abrogated by the State courts in 1893 as unconstitutional. Not long after the Hyattsville experiment a Singletax colony, or enclave, to be located in Alabama on Mobile Bay, was organized in Iowa. Out of its land values this enclave, known as Fairhope, has for nearly 25 years maintained itself and paid the general taxes levied upon its inhabitants. It is managed more in accordance with land nationalization than Singletax methods, but the principles and purposes of land nationalization and the Singletax are essentially the same. Another enclave, Arden, was established in Delaware in 1900. Since that time a third enclave, Halidon, has been located in Maine, and a fourth, Tahanto, in Massachusetts. There is also a fifth, Free Acres, in New Jersey. Under a "second class cities" law of Pennsylvania the Singletax has in limited degree been in operation in Pittsburgh and Scranton (the Pennsylvania cities of the "second class") since 1912. Pursuant to this law, land is assessed for taxation at full value, while improvements are assessed at a descending ratio of their value, with the view of ultimately taxing improvement values only half as much as land values. A formidable movement for a similar local revenue law for the city of New York has been held in legislative check by opposition to it as a Singletax measure. In degree it is so, for if half the value of improvements were exempt, the whole value of land being taxable, the rest of the Singletax proposals, even to the extent of socializing all land values, would, in the phrasing of the Singletax agitation, be "only a matter of keeping on." The Joseph Fels fund has been an important factor in the Singletax movement. Beginning in 1909, the late Joseph Fels devoted a large income, in addition to con-

stant personal service, to Singletax propaganda in the United States, Great Britain, Germany, Denmark and Australasia. He died in 1914, but his widow, Mary Fels, has continued the donations and given her own personal services in place of his. In Great Britain the Fels contributions are administered through the United Committees for the Taxation of Land Values; in the United States through the Joseph Fels Fund Commission, the work of which is of national scope and fame.

For obvious reasons no attempt has been made to bring this historical outline down to a later date than about the beginning of the World War.

Bibliography.— Besides the Singletax books noted above, reference may be had to Post's 'The Taxation of Land Values' for an analytical presentation of the subject with illustrative diagrams and answers to typical questions; to Fillebrown's 'A B C of Taxation' for a conservatively favorable view; to Carver's 'Essays in Social Justice' and Hayes's 'Introduction to the Study of Sociology,' for moderate criticisms along with partial approval; to Nearing's 'Income' for a sympathetic consideration of intimately related economic and social phenomena; to Trowbridge's 'Bisocialism' for a technical exposition; and to Mathew's 'Taxation and the Distribution of Wealth,' Mallock's 'Property and Progress' (for uncompromising opposition), Thackeray's 'The Land and the Community' (historical), Dove's 'The Theory of Human Progression,' Hirsch's 'Land Values Taxation in Practice' (a comprehensive resumé to 1908); Hirsch's 'Democracy versus Socialism' (a scholarly contrast of Socialism and the Singletax); Hurd's 'Principles of City Land Values,' Post and Leubuscher's 'George-Hewitt Campaign' (includes controversial correspondence on the Singletax between Henry George and Abram S. Hewitt); Henry George, Jr.'s 'The Life of Henry George'; American Social Science Association's report of 'The Singletax Discussion' at its meeting at Saratoga in 1890, and Henry George's 'Property in Land' (a controversy with the Duke of Argyle), and 'The Land Question' (originally written with special reference to land tenures in Ireland). Young's 'History of the Single Tax Movement in the United States' is a comprehensive and in all important respects a trustworthy narrative, and Miller's 'Single Tax Year Book' describes the progress of the movement extensively and in much detail from its beginnings in different parts of the world until about the opening of the World War.

Louis F. Post.

SINGLETON, Esther, American author: b. Baltimore, Md., 19th century. She lived in New York after 1897 and was for several years engaged in encyclopedia work. She later became known as a writer on a wide variety of topics, including music, art, literature and history. Author of 'A Guide to the Opera' (1899, 1909); 'The Furniture of Our Forefathers' (2 vols., 1900); 'Famous Paintings' (1902); 'Social New York Under the Georges' (1902); 'Great Events of the World's History' (5 vols., 1903); 'Venice' (1905); 'Dutch and Flemish Furniture' (1907); 'Turkey and the Balkan States' (1908); 'Famous Cathedrals' (1909); 'How to Visit the Great Picture Gal-

leries' (1911); 'Visit to English Cathedrals' (1912); 'American Historic Homes' (1915); 'Rodin and His Art' (1918), etc.

SINHA, Sir Satyendra Prassano, K. C., first baron, Indian administrator: b. 1860. Born of humble native parentage in a village of Bengal, Sinha went to England in 1881 to study law at Lincoln's Inn. He was the first Indian to "take silk," i.e., become a king's counsel, an honor hitherto confined to members of the bar practising in Great Britain. In 1909 Sinha became a member of the viceroy's executive council and was the first Indian to hold the office of advocate-general of Bengal. Together with the Indian Maharaja of Bikaner he represented India in the Imperial War Conference and in the War Cabinet, 1917-18, and also at the Peace Conference in Paris. On the formation of the new British ministry in January 1919, Sir S. P. Sinha was appointed under-secretary of state for India and a privy councillor, and raised to the peerage in order to represent the India Office in the House of Lords.

SINIGAGLIA, sē-nē-gā'lyā, Leone, Italian composer: b. Turin, 14 Aug. 1868. He studied under Bolzoni in Turin and later under Mandyczewsky in Vienna, where he received much assistance from associating with musicians such as Dvořák and Goldmark. Among his compositions are many violin and violincello pieces, songs and female choruses; a set of variations on Schubert's 'Haidenröslein' for oboe and piano; violin concerto in A; 'Rapsodia piemontese' for violin and orchestra; Romance in A for violin and orchestra, etc.

SINJIRLI, sīn-jēr'lē, Asiatic Turkey, a village in the vilayet of Aleppo, at the foot of Mount Amanus or Giaour Dag, 30 miles north-east of Alexandretta, ancient Iskanderun, on the Mediterranean. It is noted as the site of an ancient Hittite city, excavated under the auspices of the German Orient-Gesellschaft since 1888. The two encircling city walls and the acropolis with three lines of fortifications were disclosed, and numerous Aramaic inscriptions of great historical value were discovered. One of the most important finds, now in the Berlin Museum, was an inscribed stele, or stem of an arrow, commemorating the victory of Esarhaddon, king of Assyria, in Tammuz (June) 670 a.c., over Tirhakah, king of the Egyptians, who is represented as a negro. Consult Lidzbarski, 'Nordsemitische Epigraphik' (1898); Müller, *The Contemporary Review* (1894).

SINK HOLES, depressions due to solution of an underlying soluble rock layer, such as limestone, gypsum or salt. Sometimes they are formed by the enlargement of a joint in limestone, with the consequent slump of the overlying soil, forming a nearly circular funnel-shaped depression of small size. Larger sinks, often with steep sides, are caused by the collapse of the roof of a cave. Sinks several miles in diameter and over a hundred feet deep are common in the Ozark Region and in Kentucky. Streams often flow into sink holes and disappear, continuing as underground rivers and emerging as very large springs at some lower point. If the underground outlet becomes blocked a sink often becomes the site of a lake. Such was the origin of Alachua Lake in

Florida, a body of water over eight miles long, on which steamers at one time plied. The outlet finally opened up again and the lake became drained. Sink holes are also known as swallow holes, and are not to be confused with pot holes and kettle holes (qq.v.).

SINKING FUND. See DEBTS, PUBLIC; NATIONAL DEBTS OF THE WORLD.

SINN FEIN (shin fane, "ourselves"), an Irish party founded about 1905, whose policy may be described as at once the most extreme and the most moderate form of Nationalism. It is the most moderate because it aims at uniting Irishmen of all creeds and classes on a common platform, or a progressive series of common platforms, for Irish ends. The party, or movement as it has been termed, aims at the encouragement and support of the industries and the institutions of Ireland, and the revival of the Gaelic tongue as a medium of intercourse among the people of Ireland. Its policy has been summed up by one of its founders as "national self-development through the recognition of the duties and rights of citizenship on the part of the individual, and by the aid and support of all movements originating from within Ireland, instinct with national tradition, and not looking outside Ireland for the accomplishments of their aims." Sinn Fein is simply, then, the Gaelic for "ourselves," which, after all, is the working motto of every government and corporation in the modern world. Trusts and tariffs are Sinn Fein applied to the industrial world. The workings of empires and chosen peoples are pure Sinn Fein. The Sinn Fein party regards Ireland as being of right a distinct nation and believes in establishing "in Ireland's capital a national legislature endowed with the moral authority of the Irish nation." For the first 10 years of its life the party's policy was one of passive resistance, as a substitute for physical force, and this has meant, in substance, the laying of a boycott on everything English; the economic reorganization of Ireland by its own people, on a purely Irish basis; the non-recognition of English-made laws; and the non-support of English institutions in Ireland. It says in effect to the people of Ireland: "Buy Irish goods because they are not English, and, if you cannot get Irish goods, buy French or German or American goods, or indeed any goods rather than English. Do so as long as England refuses to keep the terms of the Renunciation Act of 1783, in which she laid it down 'that the right claimed by the people of Ireland to be bound only by laws enacted by His Majesty and the Parliament of that Kingdom is hereby declared to be established, and ascertained for ever, and shall at no time hereafter be questioned or questionable.'" Such is the message of Sinn Fein, considering the industrial revival as a political weapon.

Sinn Fein recognizes in nationality something much more wonderful and even necessary than politics. It holds, however, that nationality must have its political phase and expression, and that no nation ever yet became exuberantly itself, exuberantly a thing of beauty and use in the family of nations, unless it was politically free. Its aim as a political organization is consequently the independence of Ireland, and as a means to that end it proposes the destruction

of the machinery of foreign government in Ireland. Not that it is principally a destructive or war policy. Nationalists are anxious for peace, according to Mr. Arthur Griffith, the political thinker of genius who edits *Sinn Fein*, the party organ, and who originated the Sinn Fein policy in the columns of the *United Irishman*, but before terms of peace can be discussed, he continues, in a phrase reminiscent of John Mitchel, "England must take her one hand away from Ireland's throat, and her other hand out of Ireland's pocket." In other words, let England observe the terms by which she bound herself in the Renunciation Act of 1783, as quoted above. Thus far we have stated in this article what may be termed the official attitude of Sinn Fein during the first decade of its existence. In its second decade the movement appears to put very little trust in legal and constitutional arguments, and claims Ireland's right to be a separate and free nation as a right given by God, without troubling about its other aspect as a right confirmed by England. All Sinn Feiners are agreed to work on a common platform for the independence of Ireland, the minimum interpretation of Independence being that which is laid down in the Constitution of 1782 and the Renunciation Act of 1783. Ireland, it declares, must no longer send representatives to the British Parliament to plead to indifferent ears the cause of Irish freedom, since to do so is not only useless in practice, but is an apparent acquiescence in the terms of the Act of Union. Moreover, it holds that for Irishmen to attend in a foreign Parliament and to take an oath of allegiance to a king, who is no longer the head of a free Irish constitution, but a symbol of foreign conquest, is a lie and an act of national dishonor. Irish politics, according to the Sinn Fein ideal, must not be allowed to rest on a national falsehood, which in the 19th century did so much to corrupt and confuse the political thought of the country, but must be placed on the far securer base of truth and honor and reason. The movement stands for the building up of truly Irish industries, with the production in Ireland of whatever articles Ireland might need, and the stimulation of foreign commerce; to this end Sinn Fein urges the establishment of an Irish merchant marine and an Irish consular service to encourage foreign trade. It advocates also the creation of an Irish civil service, of Irish national courts of law, an Irish national stock exchange, Irish national banks, and the like—all these to be popular Irish institutions, completely independent of England. It is one of the objects of Sinn Fein to give the brains and muscle of the country scope and happiness in the service of Ireland. Sinn Fein thus proposes to build up the Irish nation. It has set about organizing a great national passive resistance movement to oppose the British government and British influence at every point of vantage they have gained in the country—fiscal, educational, industrial, legal, literary, dramatic, artistic. Ireland, it says, has too long met England on battlefields which England herself has chosen—the floor of the House of Commons and the field of war. Let Ireland now choose the place of battle and let it be the Irish school, the Irish factory, the Irish shop, the Irish home, the Irish farm, the Irish church, the Irish theatre,

and Sinn Feiners have no doubt that a new and beautiful individuality will be added to the family of nations. Prominence has been given to the aims and professions of Sinn Fein as a school of nationalism with which the future will have to reckon. It aims at building a nation to include all the races and creeds and ranks that inhabit Ireland. It answers the argument that Ireland is too small and too poor to be an independent nation by pointing to such nations as Switzerland, Denmark, Greece, Sweden, Norway, Rumania of less area, population and revenue.

COUNTRY	Taxation per head
Denmark.....	\$8.25
Württemberg.....	7.13
Greece.....	5.87
Rumania.....	5.98
Sweden.....	8.37
Norway.....	8.11
Switzerland.....	6.87
Ireland.....	11.03

Sinn Fein certainly has brought intellect, imagination and constructive ideas into Irish politics to a degree unparalleled since the days of the Young Irelanders of 1848. It remains to be stated here that the Rebellion of April 1916 was not entirely the work of the Sinn Fein party but the result of the continued preaching of the Fenian doctrines. Up to 1916 Sinn Fein had put forward only one candidate for an Irish constituency and he was overwhelmingly defeated. The Irish question was shelved for a time by the British Cabinet. On 27 April 1917 Lloyd George proposed an Irish convention to settle the Irish question, promising that if there developed a substantial majority for Home Rule within the convention his government would legalize the recommendations of that majority. After a year of discussion a plan of Home Rule was adopted and agreed upon by all but 19 Ulster Unionists, and an April 1918 Lloyd George held that the 19 dissenting votes out of 100 showed a lack of substantial agreement and stated that Ireland's case would thereafter be treated as a purely British question. On 17 May 1918 Dublin Castle (the centre of the English bureaucracy in Ireland) issued a proclamation declaring the discovery of a vast German plot. Eamonn De Valera, Arthur Griffith and numbers of prominent Sinn Feiners were arrested and sent to England to be confined "during the King's pleasure." When several days passed without either arraignment or trial of any of the prisoners, a general demand arose that the government disclose some proof of the alleged German-Sinn Fein plot. Although the Labor party, many Liberals and the Irish Nationalists, and the press demanded that evidence of the plot be produced, the government remained silent. In this connection, nothing is more significant than the statement of Lord Wimbourne, former Lord-Lieutenant of Ireland, that throughout his régime he had discovered no sign of the alleged plot and asserting his belief that *satisfactory evidence of its existence could not be produced*. The Sinn Feiners, men and women, were confined in England until March 1919 without arraignment, without the production of one single piece of evidence against them and were denied the right of counsel. By the end of June 1918 Conscript-

tion and Home Rule measures were formally abandoned, and the government in Ireland ran its course to the elections of December 1918. The Sinn Féin party went before the electorate on the definite proposition of an independent Irish republic, and the total separation of Ireland from the political system known as the British Empire. At the polls the Sinn Féin victory was overwhelming. Out of 32 counties its candidates ran unopposed in 22. In Ulster it carried Donegal, Monaghan and Cavan, and won majorities in Fermanagh and Tyrone, carried a seat in Derry City, the supposed stronghold of Unionism. It lost only in Down, Derry, Armagh and Antrim. Of 101 members the Sinn Féin elected 73, the Nationalists seven and the Unionists 21. With this mandate from seven-tenths of the people of Ireland, the Sinn Féiners proceeded to organize their Irish Parliament. On 21 Jan. 1919 the Dáil Éireann (Irish Parliament) met in Dublin and called upon the free nations of the world to support the Irish republic by recognizing Ireland's national status. Eamonn De Valera was chosen President of the Irish republic. He, with Arthur Griffith and Count Plunkett, were named commissioners to the Peace Conference at Paris. Passports being denied them, three Irish-Americans interceded in their behalf with the American delegates at Paris but without result. The three Irish-Americans, however, Messrs. Dunne, Ryan and Walsh, were permitted by the British government to visit Ireland. They reported that they found conditions "appalling." Men were herded in filthy, unsanitary prison dungeons, were compelled to sleep in clothes drenched with cold water, were compelled to attend divine service with hands fastened behind their backs, etc., etc. The publication of the report called forth much discussion, vigorous denials and as vigorous demands for investigation. After a delay of two weeks the Chief Secretary for Ireland made his reply to the charges in Parliament, explaining or denouncing the findings of the report, but its authors insisted upon its truthfulness, and that an impartial committee should be appointed to pass upon the facts of which they had authentic evidence. In 1919 De Valera made a lecture tour in the United States explaining the purposes and aims of the Sinn Féin.

J. B. McDONNELL,

Editorial Staff of The Americana.

SINNETT, Alfred Percy, English journalist and theosophist: b. 18 Jan. 1840. After study at the London University School, he became connected (1859) with the *Globe* newspaper, later was sub-editor and "leader" writer for various dailies in London, and in 1865-68 was at Hongkong, as editor of the *Press*. On

his return he became an editor of the *Standard*, took editorial charge of the *Pioneer of India*, and becoming identified with the Theosophical movement, was made president of the London branch of the society, and wrote: 'The Occult World' (1881); 'Esoteric Buddhism' (1883); 'The Growth of the Soul' (1896). He edited *Broad Views* from 1904 to 1907. A play by him, 'Married by Degrees' was produced (1911) in London.

SINON, a character in the Trojan war-story of post-Homeric origin. According to Virgil, he was a follower of Ulysses, allowed himself to be taken prisoner by the Trojans, and persuaded them to drag the colossal wooden horse into their city. Within this structure were concealed all the leading warriors of the Greek army. The night following the admission of the horse, Sinon gave the signal to the besiegers, by lighting a beacon, released the heroes from the horse, in which they were imprisoned, and thus brought about the sack of Troy.

SINOPE, sī-nō'pē (Turkish, Sınub), Asiatic Turkey, a seaport city, capital of a sanjak, situated on the neck of land connecting the rocky peninsula of Cape Sinope, in the Black Sea, with the mainland, 350 miles east-northeast of Constantinople. It is enclosed by a wall flanked with towers and defended by a castle and several forts, and is built to a considerable extent out of the ruins of an ancient Greek city. Its harbor is the best on the south shores of the Black Sea, and it has a naval arsenal and a shipyard, at which many vessels are built. On 30 Nov. 1853, 18 Russian ships here attacked and destroyed a Turkish flotilla consisting of six frigates, three corvettes and two steamers, manned by about 4,000 men. Sinope is a place of great antiquity. It was the birthplace of Diogenes and the capital of Mithridates the Great. Pop. about 9,000.

SINTER. See GEYSERITE, CALC-TUFA, and TUFA.

SINUB, sē-noob'. See SINOPE.

SINUS, in anatomy, a cavity of bone or other tissue, especially an air cavity of some size, such as those in the interior of certain bones, the frontal, ethmoid, sphenoid, temporal, superior maxillary, etc. The frontal sinuses are two irregular cavities extending upward and outward from their openings on each side of the nasal spine, between the inner and outer tables of the skull, and separated from one another by a thin bony septum. They give rise to the prominences above the root of the nose called the superciliary ridges. They are not fully developed till after puberty, and vary considerably in size, being usually larger in men than in women and young persons. When very much developed they give a receding appearance to the forehead. They communicate on each side of the upper part of the nostril by a funnel-shaped opening, which transmits a prolongation of mucous membrane to line their interior. These sinuses are much more highly developed in certain mammals and birds than in man. They extend backward over the top of the skull in the ruminant and some other quadrupeds, and penetrate the cores of the horns in oxen, sheep and a few antelopes. The most remarkable development of air sinuses in

the mammalian class is presented by the elephant; the intellectual physiognomy of this huge quadruped being caused, as in the owl, not by the actual capacity of the brain case, but by the enormous extent of the pneumatic cellular structure between the outer and inner plates of the skull. The sphenoidal sinuses are two large irregular cavities, formed, after the period of childhood, in the body of the sphenoid bone. They communicate with the upper part of the nose, from which they receive a layer of mucous membrane. Like the frontal sinuses, they serve to lessen the weight of the skull and to add to the resonance of the voice. The ethmoid sinuses lie in the lateral masses of the ethmoid bone. They communicate with the cavities of the nose. Their main use is to diminish the weight of the fore part of the skull. That part of the temporal bone which forms the projection behind the ear is termed the mastoid process. The interior of this process is hollowed out with air sinuses which communicate with the tympanum or middle ear, and through it with the nose. The superior maxillary sinus is the largest of the sinuses, and the only one present in the infantile skull. The term sinus is also applied to irregular channels for the transmission of venous blood.

SION. See **ZION**.

SIOUAN, soo'an, a designation derived from the word "Sioux," and applied to the linguistic stock or family to which the Sioux Indians belong. The Sioux call themselves Dakota, or Lakota, and the name "Sioux," given to them by the whites, is said to be derived from an Algonquin word signifying the "snake-like ones," or enemies, a term which their crafty methods of warfare would seem to justify. The family of tribes, of which the Sioux are the best known to Americans of the present day, includes, as principal divisions, the Dakotas or Sioux in the United States, and the Assiniboin in British North America, although both Sioux and Assiniboin occasionally cross the border into adjoining territory. The Sioux division embraces the sub-tribes of Santee, Sisseton, Wahpeton, Yankton, Yanktonnai and Teton, and the last mentioned, whose name means "dwellers on the prairie," are again subdivided into the Brulé Sioux, the Sans Arcs, Blackfeet, Ogalalla, Minneconjou, Onopaw and Unkpapa. To the Sioux nation also belong or belonged the sub-tribes of Omaha, Quapaw or Arkansa, Ponca, Osage and Kansa, Iowa, Oto and Missouri; also Winnebago, Mandan, Minnetaree or Gros Ventres (which last named includes the Crow Indians), Tutelo, Biloxi, Catawba (or Flathead), Eutaw, Chickoree, Natchez and others, and the Mannahoak, Monacau and other tribes, which came into contact with the pioneers of Virginia and North and South Carolina, and are now extinct or represented by insignificant remnants.

The Siouan tribes of the East which were not crushed out in conflict with the early settlers retreated gradually to the Northwest, and made their final stand in that region against advancing civilization. The battle known as the Custer (q.v.) massacre (25 June 1876) was the last important military event of the long conflict, and it was followed by such energetic measures on the part of the United States that organized resistance by the Sioux to the Na-

tional authority was finally terminated. Sitting Bull (q.v.), the last of the great Indian chieftains who rose above the level of marauders, and were actuated by a sincerely patriotic spirit in their resistance to white aggression, was killed on 15 Dec. 1890 when his arrest by government agents was resisted with an attempted rescue. See **INDIANS, AMERICAN**.

SIOUX (soo) **CITY**, Iowa, county-seat of Woodbury County, on the Missouri River at the mouth of the Big Sioux, and on the Chicago and Northwestern; Chicago, Minneapolis and Saint Paul; Illinois Central; Chicago, Milwaukee, Saint Paul and Omaha; Chicago, Burlington and Quincy, and Great Northern Railways, 18 lines of these six systems radiating in every direction. It has steamer connection with the Missouri River ports and trolley connection with suburban villages. It is the commercial, industrial and livestock centre of western Iowa, northern Nebraska, most of South Dakota and southwestern Minnesota. The residence portions are on high, rolling ground, much of which overlooks the valleys of the Missouri and Floyd rivers, the latter stream flowing through the city. Sioux City was first settled in 1849 and for many years was the outfitting point of all the traffic to the Black Hills, as well as headquarters for the troops engaged in various campaigns against the Indians. Its first railway was the Northwestern, reaching the city in 1868. In earlier years Sioux City attained much fame through its "Corn Palaces," this annual entertainment being abandoned when the Interstate Live Stock Fair was organized, of which institution it is claimed that it is the largest fair in the United States with neither State nor Federal aid. The government census of 1918 gives 350 manufacturing establishments, with invested capital to the amount of \$46,000,000. There were employed in the factories 8,500 persons, whose annual wages amounted to \$9,800,000; the raw material cost was \$40,819,000, and the annual value of products was \$85,000,000. Chief among Sioux City's industries are its six large packing houses, consuming the major portion of the livestock receipts of the sixth largest market in the United States. Other industrial establishments are brick and tile plants, flour and cereal mills, planing mills, soap factories, furniture factories, foundries, steel and iron works, truck and tire factories, stock equipment factories, stock serum plants, overalls, shirt and skirt factories, tent and awning factories and creameries producing 12,000,000 pounds of butter annually. Its grain concerns handled more than 50,000,000 bushels of corn, wheat and other cereals in 1918. Sioux City is also a large jobbing centre, its 80 wholesale houses doing a business of approximately \$150,000,000 annually in Iowa, Minnesota, Nebraska, South Dakota, North Dakota, Wyoming and Montana. The principal public buildings are the Federal building for the enlargement of which an appropriation of \$335,000 was secured in 1915; the Union Station, cost \$600,000; Y. M. C. A. building, \$120,000; public library, \$100,000; City Hall, \$80,000; Court House, \$750,000; the Davidson and the Francis office buildings, costing \$400,000 each; Davidson's Grain Exchange building; High School, \$550,000; two Junior High School buildings;

Saint Joseph's, Samaritan, Saint John's, German Lutheran and Saint Vincent's hospitals. The waterworks, costing \$1,250,000, are owned by the municipality; it is debt free and pays an annual profit, which is put back into extensions. The city has 75 miles of concrete paving, with 40 miles of asphalt and block. Sioux City has a public park system of nearly 2,000 acres, the largest being Stone park (800 acres) and Riverside park (575 acres), both located along the Big Sioux River. The latter contains the grave of War Eagle, most famous of all the Sioux chieftains. Floyd park surrounds a massive and beautiful monument to Sergeant Charles Floyd, a member of the Lewis and Clarke expedition, who died there in 1805. The educational institutions, other than a most complete public school system, are Morning-side College (Methodist), opened in 1890; Trinity College for boys (Catholic), founded in 1912; the National Business Training School and several parochial schools. The 18 banks have a combined capital of \$3,330,000 with deposits aggregating \$46,913,000. Sioux City is the natural centre of a vast and famous agricultural section, the 100 counties nearest to the city in Iowa, Nebraska and South Dakota producing nearly \$600,000,000 in crops and livestock annually, as against \$250,000,000 for all the New England States combined, according to the last Federal census. Population (1890) 37,806; (1900), 33,111; (1910), 47,828; (1915), 61,787; (1919), 80,000 (estimated).

SIOUX FALLS, S. Dak., city, county-seat of Minnehaha County; on the Sioux River, and on the Chicago, Milwaukee and Saint Paul and the Chicago, Saint Paul, Minneapolis and Omaha, the Illinois Central, the Rock Island, Watertown and Sioux Falls and the Great Northern railroads, about eight miles from the Iowa boundary. It was settled in 1856 by the Western Iowa Company of Dubuque, Iowa, but was abandoned the next year. Soon afterward the place was again settled by eastern homeseekers. It was organized as a village in 1877 and chartered as a city in 1883. In the vicinity are extensive quarries of marble, jasper and other stones. The river here has a fall of about 100 feet in a half mile, forming a series of cascades which furnish extensive water power. The city is located in the midst of a rich agricultural community; corn, small grain, hay, livestock and dairy products being the principal sources of wealth. The chief industries are meat packing, manufacture of confectionery, metal culverts, grain bins, sash and cabinet work, crackers, brick, paper boxes, plows and harrows, soft drinks, soap, acetylene gas outfits, cigars, building-stone, paving-blocks and crushed rock from the quarries. Three creameries make a great quantity of butter and have built up a good cream, egg and poultry market. Some 4,000 people are employed in manufacturing exclusively, turning out products valued in excess of \$20,000,000. The city is a strong wholesale and jobbing centre, being especially favorable for the distribution of agricultural implements and vehicles. Sioux Falls is not only the commercial and industrial centre of South Dakota, but enjoys a good trade in southwestern Minnesota and northwestern Iowa. The principal buildings are the State penitentiary, State School for the

Deaf and Dumb, State Children's Home, County Courthouse, Coliseum, municipal buildings and the 30 churches, which include a Roman Catholic and Protestant Episcopal cathedral. The public school system is one of the best in the country, the newer grade schools being of advanced type of construction, built on the one-story, community centre plan. Among the higher institutions of learning are All Saints School for Girls, the Lutheran Normal School and Sioux Falls College. The eight banks have a combined capital of \$925,000. The government is vested in a three-man commission elected for a period of five years, one of the commissioners acting as mayor at a salary of \$3,000 per year, and the other two commissioners at \$2,000 per year each. Pop. 32,000.

SIPHON, a bent pipe having the ends approximately parallel so that when the short end is sunk in a liquid, the bend may carry the pipe over the higher edge of the containing vessel and the long end of the pipe being then positioned lower than the short end, the liquid may be drained off by gravity, once the flow is started. The reason for this is that when the air is sucked from such siphon the liquid flows in and the larger end containing the greatest weight of liquid starts a flow. The fluid has to rise in the short end or there would be a vacuum. The siphon will not raise water more than 32 feet, because then the weight of water equals the atmospheric pressure. If there were no weight of atmosphere the phenomenon would not occur. A siphon has to be of moderate diameter, else the suction does not operate fully. A considerably depressed series of piping in a water main is sometimes termed an inverted siphon as where the Catskill aqueduct passes under the Hudson River.

SIPHONOPHORA, an order of free-swimming polyps (*Hydrozoa*). All are remarkable as forming colonies of zooids, which become differentiated as organs of special function, and altogether lose their separate individuality. They present the most noteworthy instances of polymorphic colonies known to zoology and differ greatly in complexity. In the most complex cases the zooids or polyp organs may be divided into about seven types, each differing in form and function but retaining the fundamental polyp structure. These are: (1) pneumatophores or floats; (2) nectocalyces or swimming bells, whose function is to propel the colony; (3) gastrozooids, or nutritive polyps, which feed the colony; (4) hydrophyllia, leaf-like protective polyps; (5 and 6) dactylozooids and tentacula, offensive polyps armed with numerous stinging cells; (7) gonozooids or reproductive polyps of different types. The siphonophores are delicate transparent animals often beautifully colored, and they abound in the Gulf Stream and other warm oceanic waters. A familiar example is the Portuguese man-of-war (*Physalia*). Consult Haeckel, 'Challenger Reports' (Vol. XXVIII London 1888).

SIPPAR, sip-pär', **SIPPARA**, **SEPHAR-VAIM**, or **ZIMBIR**, ancient Babylonian city, on the Euphrates and north of Babylon. It was originally two cities, divided by a canal and designated Sippar and Agade. In time, however, the name Agade was lost, but the division

remained, one part of the city being the Sippar of Shamash, the Sun God, and the other the Sippar of the goddess Annuit. The Old Testament name for it is Sepharvaim. The records of the antediluvian world are supposed to have been buried here by the Chaldean Noah. The temple of Shamash was discovered by Hormuzd Rassam in 1881, by whom extensive excavations were made, and who brought to light nearly 60,000 inscribed tablets. Consult Hormuzd Rassam, 'Babylonian Cities' (1881); and 'Asshur and the Land of Nimrod' (1897); Scheil, V., 'Mémoires Français d'Archéologie Orientale de l'Institut de Caire' (1902).

SIQUIJOR, sê-kê-hôr', Philippines. (1) Pueblo, island of Siquijor, province of Bohol, on the northwest coast of the island. It has a good harbor and is the chief port and principal town of the island. Pop. 11,790. (2) Island, the second in importance of the province of Bohol, lying southwest of the island of Bohol, and east of Negros; length from east to west, 17 miles; width 12 miles, area, 126 square miles. The surface is much broken, rising to a central peak, 1,394 feet high. The soil is fertile; tobacco of excellent quality, rice, corn, hemp and chocolate are raised and bartered for wax and cotton; a coarse variety of hemp cloth is manufactured for export; tortoise shell and sea cucumbers (*bêche de mer*) are gathered in large quantities. Pop. 46,023.

SIR, a term of courtesy, applied without distinction of rank, to all male adults, used especially in the form "Dear Sir," in opening a letter. It is also the special title in Great Britain of knights and baronets, and as such is always prefixed to the Christian name. *Sire* is a term of respect by which kings are addressed. The word *sir* is the same in origin as *sire*, and is derived from old French *senre*, and that from *senior* (Latin, elder), whence also *seignior*, *signor*, similar terms of courtesy.

SIR DARIA, sêr-dâr'yâ, Russian Turkestan. See **SYR DARYA**.

SIR GAWAIN AND THE GREEN KNIGHT, generally regarded as the finest of the metrical romances in Middle English. It is usually held to be the work of the author of 'The Pearl' (q.v.), though absolute proof of this is impossible. It was written in the West Midland dialect about 1370, in an elaborate stanzaic form, employing both alliteration and rhyme. The same highly-wrought artistry appears in the narrative, with its wealth of description and detail. These elements are, however, subordinate to a carefully considered plot, which is in brief as follows: A strange knight clad all in green bursts into Arthur's hall at Camelot, and challenges any knight to strike him with the battle-axe, the blow to be returned by the challenger a year later. Gawain accepts, and severs the champion's head at a blow. After picking up his head, which reminds Gawain of the coming meeting at the Green Chapel, the knight rides away. A year passes. Gawain, on his way to the Green Chapel, is splendidly entertained in a magnificent castle. On three successive days the lady of the castle offers her love, but Gawain acts with scrupulous honor toward his host, concealing nothing from him save a lace given him on the third day, which is to afford protection in combat. At the meeting with the

Green Knight, Gawain gets only a slight wound the third time that the axe is raised. The knight thereupon reveals himself as the lord of the castle, and the third blow as a punishment for the keeping of the lace on the third day. The whole episode was a test, instituted by Morgan the Fay, who wished to test the knights of Arthur and frighten Guinevere. Gawain returns to the court, where all the warriors agree to wear a green girdle, in remembrance of the adventure.

The immediate source of the poem was undoubtedly a French romance now lost. The different elements in the plot are admirably traced by Kittredge in 'A Study of Sir Gawain and the Green Knight' (Cambridge 1916). The whole has been translated, in the original metre, by Miss J. L. Weston, 'Romance, Vision and Satire' (Boston 1912).

WILLIAM WITHERLE LAWRENCE.

SIRAJGANJ, sê-râj-günj', or **SERAJGANJ**, India, a town in the district of Pabna, Bengal, on the Jamuna River, 153 miles northeast of Calcutta. The town is six miles from the low water channel of the river, separated by a sandy plain and the river landing-places shift every flood season. Founded about the beginning of the 19th century, it is now one of the chief river marts in Bengal, having risen with the growth of the jute trade. It collects jute, rice, oil-seeds, tobacco, etc., from all the neighboring districts for dispatch to Calcutta and distributes piecegoods, salt, sugar, iron, hardware, etc. The trade is entirely water-borne, 150,000 tons of jute being exported annually. A large industry is the weaving of gunny, or jute cloth for bags, which is exported to the value of \$600,000 a year. Pop. about 25,000.

SIREN, (1) in zoology, the mud-eel (*Siren lacertina*), having a mouth very beaklike, with a few rasplike teeth and tufted gills. It is found in the bayous of the Carolinas, Florida and Texas. (2) A mechanism for producing continuous or musical sounds, and for measuring the number of sound-waves or vibrations per second, which produce a note of given pitch. In its original form it consists of a disc with a circular row of oblique holes, revolving close to the top-

Siren.

plate of a wind-chest perforated with corresponding holes of a contrary obliquity, so that the jets of air from the latter passing through the former keep the disc in motion and produce a note corresponding to the rapidity of the coincidences of the holes in the two plates,

the number of coincidences or vibrations in a given time being shown by indices which connect by toothed wheels with a screw on the axis of the disc. For steam-siren see FOG-SIGNALS.

SIRENIA, an order of aquatic herbivorous mammals, with almost hairless skin, no hind limbs, the tail flattened horizontally and two teats situated on the chest. The unborn young are covered with a thick fur; and many points of dentition, structure and life history show affinity to the ungulate land mammals. There is much less relationship to the *Cetacea* within which this group was formerly classified. The order embraces but three recent genera, *Manatus*, *Halicore* and *Rhytina*, the latter now extinct, representing as many families. Besides these a number of fossil genera are known. *Halitherium* occurs in Miocene and Pliocene formations; it was of large size, and appears to have been somewhat intermediate in structure between the two living genera and to have possessed rudimentary hind limbs. Consult Brandt, 'Symbolæ Sirenologicæ' (Saint Petersburg 1868); Woodward, 'Vertebrate Paleontology' (Cambridge 1898). See DUGONG; MANATEE; SEA-COW.

SIRENIDÆ. A family of large newts characterized by three pairs of persistent external gills, the absence of any trace of hind-legs, eyelids or maxillary bones, and of teeth in the jaws (which are covered by horny sheaths). Teeth are found, however, on the vomer. The family is closely related to the *Proteida* (q.v.). It contains two genera, of one species each, both inhabiting the Southeastern States. These are *Siren* and *Pseudobranchius*. In *Siren* there are three gill-clefts on each side and four fingers, and the gills atrophy in the course of development, being subsequently regenerated. In the adult *Pseudobranchius* the gills are functionless and there are only three fingers on each hand, and one pair of gill slits. *Siren* grows up to the length of 30 inches. See AMPHIBIA; URODELA.

SIRENS, in Greek mythology, the name of several sea-nymphs, who by their singing fascinated and later destroyed those who approached their locality which was the sea between the island of Circe and Scylla (q.v.). When Ulysses approached Circe, which was near the northeast coast of Sicily, he stuffed the ears of his companions with wax, while he bound himself to the mast, and so they escaped. The Sirens then threw themselves into the sea, where they became formidable rocks.

SIRIUS, sir'ī-ūs, in astronomy, the brightest star in the heavens, also called the Dog-star, situated in the mouth of the constellation Canis Major. Its magnitude is 1.6, and its distance 8.8 light years. In 1862 it was proved by Alvan G. Clark to be binary, which was believed because of disturbances of its proper motion. The companion star is almost a satellite, being of 10th magnitude, that is rendering about 1 to 21,000 of Sirius light. They revolve in 51 years. See ASTRONOMY.

SIROCCO, a hot, relaxing and oppressive southeast wind, which blows in Sicily and South Italy. While it continues the atmosphere is obscured by a haze and so great is the languor it occasions that few persons quit

their houses. It is supposed to be the same as the simoom (q.v.), tempered by its passage across the water.

SIRVENTE, sir-vōnt, a form of recited verse common among the Troubadours and Trouverses. These songs were originally devoted to love, war, praise, etc., and divided into strophes of a peculiar construction. Later they degenerated into satire and reflections on political abuses.

SISAL HEMP, *Agave fourcroyoides* and *sisalana*. The growing plants resemble the century plant, though the leaves are more slender and spear-like; they measure three and one-half to five feet long, and four to five inches wide, the general average being four to four and one-half inches. The product is a structural fibre derived from the older leaves, the first cuttings for fibre being made when the plants are five years old from the date of setting out in the field. The filament is yellowish white, straight, smooth and clean, sisal ranking second to manilla in value as a cordage fibre. It is a native of Yucatan, which furnishes the bulk of the world's supply, and the Bahamas, and very recently Hawaii has contributed a little. It is found (introduced) in many parts of Mexico proper, throughout the West Indies and in Central and South America. It was introduced into Florida by Perrine, in 1836, and into the Bahamas by Nesbit, in 1845, Yucatan plants being used, and into Hawaii, from Florida, in 1893. The growth of the plant, experimental or otherwise, has been extended to many parts of the world, commercial cultivation having been attempted in India and on the west coast of Africa.

The commercial supply of the United States is derived mainly from Yucatan. In Florida the plants are found growing semi-wild in small tracts, both on the keys and the east and west coasts of the mainland. Small attempts have been made from time to time to establish an industry, but it is doubtful if the culture could be made to pay in Florida, especially in competition with the vast sisal hemp farms of Yucatan. The Yucatan industry is centred at Merida, 20 miles south of Progreso, the port of shipment. On the larger farms systems of miniature railways are laid down for the transportation of the bundles of cut leaves from the fields to the central factories, where the cleaning or scraping process is effected by powerful machines. The operation consists merely of removing the epidermis and soft cellular tissue, which leaves the fibre clean and white; it is then dried in the sun and baled for market. Sisal hemp and manila hemp make up the bulk of the hard fibre used for cordage in the United States, the larger portion of the sisal going into binder twine for binding the grain crop, though considerable rope is made from it for inland use.

Consult Special Reports (Nos. 1 and 5); Fibre Investigations, Department of Agriculture; 'Scientific American Supplement' (No. 1,837, 2 Aug. 1902); Bulletins Royal Gardens, Kew; Bulletin (No. 4) Hawaiian Agricultural Experiment Station, Honolulu; and James M. Rae, 'Report on the Fibre Industry of the Bahamas' (Nassau 1891). See BAHAMAS; CORDAGE; FIBRE; HEMP; YUCATAN.

SISCOWET. See LAKE TROUT.

SISKIN, a European finch (*Carduelis spinus*), of the *Fringillidae*, greenish in general color, with dusky and yellowish markings and the under surface whitish. These birds are usually seen in small flocks, haunting the margins of streams, and are much sought after by bird catchers, and when interbred with the canary produce a hybrid progeny with a sweet mellow song. A very similar Canadian bird is known as the pinesiskin; and the name is sometimes given to the goldfinch. See FINCH.

SISLEY, sis-ly, Alfred, French painter: b. Paris, about 1830; d. 1899. He was little known except as a promising pupil of Gleyre, until the Impressionists held their exhibition in 1874, when his boldness and originality were acknowledged. His indebtedness to Corot and even more so to Monet is apparent in all the landscapes which he produced, characterized as these are by poetic charm and remarkable freshness and frankness in color and detail. Among his works may be mentioned 'La Seine à Saint Mammés' and 'L'Inondation, Marly' (1876).

SISMONDI, sis-mōn'dī (Fr. sēs-mōn-dē), Jean Charles Léonard Simonde de, Swiss historian and political economist: b. Geneva, 9 May 1773; d. near there, 25 June 1842. He had scarcely completed a careful education at the College and the Auditoire of Geneva when the overthrow of the constitution of his native town obliged him to flee with his father to England. On his return, two years after, he was imprisoned and lost the greater part of his property by confiscation. Similar persecution followed him even in Tuscany, whither he proceeded in 1795 and where he was hated by the French as an aristocrat and by the Italians as a Frenchman; but at length, on his return to Geneva in 1800 he was allowed to live in quietness and devote himself with the utmost diligence to literary pursuits without declining to bear his part in the discharge of municipal functions. His first published work appeared in 1801 and was entitled 'Tableau de l'Agriculture Toscane.' It discards all appearance of theory and abounds in practical details. In 1803 he published a work entitled 'De la Richesse Commerciale, ou Principes d'Economie Politique appliqué à la Législation du Commerce.' This essay was afterward remodeled so as to form the groundwork of his treatise published in 1819 under the title of 'Nouveaux Principes d'Economie Politique.' He had become intimate with Madame de Staël, and in 1805 accompanied her suite on a tour through Italy. The associations thus awakened appear to have called his attention particularly to history. The first fruits of his labors in this department appeared in 1807, in the first two volumes of his 'Républiques Italiennes,' which ultimately reached 16 volumes, and was not completed till 1818. It was followed by 'De la Littérature du Midi de l'Europe' (1813, English translation by Roscoe, 1823). His 'Histoire des Français' (1821-44) occupied the greater part of his remaining life. It was carried to 31 volumes, though reaching no farther than 1750.

SISSOO, or **SISSUM**. See DALBERGIA.

SISTER-SERVANTS OF SAINT MARTHA. See ORDERS, RELIGIOUS.

SISTERHOOD of the Good Shepherd; Sisterhood of the Holy Child; Sisterhood of the Holy Family; Sisterhood of the Holy Nativity. See ORDERS, RELIGIOUS.

SISTERS, Apostoline; Sisters of the Assumption; Sisters of Atonement; Sisters of Bethany; Sisters of Bon Secours; Sisters of Charity; Sisters of the Divine Compassion; Sisters of the Faithful Virgin; Sisters of the Holy Child Jesus; Sisters of the Holy Cross; Sisters of the Holy Ghost; Sisters of Sagasse; Sisters of Mercy; Sisters of Misericorde; Sisters of Our Lady of Good Counsel; Sisters of Our Lady of Perpetual Help; Sisters of the Poor; Sisters of Providence; Sisters of Saint Agnes; Sisters of Saint Ann; Sisters of Saint Augustine; Sisters of Saint Benedict; Sisters of Saint Bridget; Sisters of Saint Dominic; Sisters of Saint Francis; Sisters of Saint John the Baptist; Sisters of Saint John the Evangelist; Sisters of Saint Joseph; Sisters of Saint Margaret; Sisters of Saint Mary; Sisters of Saint Monica; Sisters of the Sorrowful Mother; Sisters of the Transfiguration. See ORDERS, RELIGIOUS.

SISTINE CHAPEL. See VATICAN, THE.

SISTINE MADONNA. See MADONNA IN ART.

SISTRUM, a primitive rattle or jingling instrument much used by the ancient Egyptians in their religious ceremonies, especially in the worship of Isis. It consisted of a thin somewhat lyre-shaped metal frame through which passed loosely a number of metal rods, to which rings were sometimes attached.

SISYPHUS, sis'y-fūs, a character in Greek mythology, son of Æolus, and husband of Merope, often quoted as an example of fruitless and recurrent toil. He is related to have been a king of Corinth and to have originated the Isthmian games. He tried to cheat death and gave offense to both Jupiter and Pluto. As a consequence he was condemned after being returned to the underworld to roll a heavy stone to the top of a hill, on reaching which it would always roll back again; thus making his punishment eternal.

SITA, in Hindu mythology, one of the incarnations of Lakshmi, goddess of prosperity, learning and love, and the beautiful wife of Vishnu. Certain holy devotees, having nothing else, gave their own blood as tribute to the tyrant Lanka; and from this blood Sita came forth, the most perfect and handsome of women. Another myth makes her the daughter of Janaka, king of Mithila. She is also called Parthivi (earth) and is said not to have been born of women but to have come forth from the furrow where her father was ploughing the earth. Hence the meaning of the word Sita is generally given as "furrow." She seems to have been a nature goddess of productiveness or fertility. See SRI; VISHNU.

SITATUNGA. See BUSHBUCK.

SITKA, a tribe of the Koluschan stock of North American Indians, formerly residing on Norton Sound, Alaska, who were driven therefrom by the Russians to Baranof Island, where

their principal village, Sitka, was established. In 1880-81 they numbered 720, of whom 540 resided at Sitka; in 1890 their population was 815. In addition to Sitka they had temporary villages at Hot Springs and Indian River.

SITKA (formerly **NEW ARCHANGEL**), Alaska city, port of entry, capital of the Territory, on the west coast of Baranof Island, 57° 30' N. lat., about 1,500 miles north of San Francisco. It was founded in 1799-1800 by Alexander Baranov, the then Russian manager of Russian America. For a time Sitka grew in importance as a trading station and even as a manufacturing town. It was the commercial port not only of Russian America, but of the Pacific coast of America. The managers of the industries which made Sitka of importance failed in some of their enterprises, and gradually the place dwindled to an Indian village of about 100 log huts. Such the United States forces found it when they took possession 18 Oct. 1867. It is a coaling station for the United States navy and has a number of industries which not only supply the local needs, but which are a means of trade with the neighboring islands. In 1903 there were Russian Orthodox, Presbyterian, Roman Catholic and Protestant Episcopal churches. There were two public graded schools and the Sitka Training School (Presbyterian), an industrial school. In the training and industrial schools, special attention is given to farming and domestic science. Pupils from Sitka attend the Indian School at Carlisle, Pa. Among the places of interest are Saint Michael's Church, built in 1816 by the Russian Orthodox, the hospital and a museum. The rainfall is heavy, 85 inches annually, but the temperature is mild for the locality, the mean for December being 32°. The island has a great variety of trees, mosses and flowers; over 300 different kinds of wild flowers have been found here. Pop. about 1,200. See **ALASKA**.

SITTING BULL, Sioux Indian chief: b. Dakota, about 1837; d. 15 Dec. 1890. He was the son of Jumping Bull and the nephew of Four Horns and Hunting-His-Lodge, all Sioux chiefs. He was first named The Sacred Stand, but at 14, having slain and scalped his first enemy, his name was changed to Sitting Bull (in Indian, *Tatanka Yotanka*). As a young man he showed enmity toward the whites and was repudiated by the more peaceable members of the tribe. During the Civil War he led in massacres of whites in Iowa and Minnesota, and in 1864 was driven by United States troops into the Big Horn country and to the Yellowstone. In 1866 he made a pretense of treating with the government, but the next year was again on the war path, and until 1876 was almost continually engaged in warfare with whites or friendly Indians. That year his band exterminated the force commanded by General Custer, sent against them on the Little Big Horn. After the massacre he escaped with his followers into Canada, and there remained until 1879, when to end a precarious existence he accepted the amnesty promised by Gen. N. A. Miles and returned to United States territory. Though submissive he was never friendly toward the government, and in 1888 influenced the Indians not to sell their lands. During the Messiah craze of 1890 his influence was con-

sidered dangerous and his arrest was ordered. In the attempt to carry out this order he was killed together with his son, several chiefs and members of the Indian police. See **SIOUAN**.

SIUT, *sē-oot'*, or **ASYŪT**, *ā-sē-oot'* (ancient, **LYCOPOLIS**), Upper Egypt. (1) The capital of a province of the same name, situated in a fertile district near the left bank of the Nile, 248 miles by rail south of Cairo. The town is about three-quarters of a mile west of the river, where a modern barrage and lock in connection with the great Nile irrigation scheme (see **ASSOUAN**) was completed in 1902. The main street, running east and west, is about three miles in length. Among the chief buildings are the railway station, the government buildings, a good hospital, public baths, an American Presbyterian mission station, with schools, mosques, bazaars, etc. Plotinus, the great Neo-Platonic philosopher, was born here in 205 A.D. See **ASSIUT**. (2) The province, has an area of 768 square miles; pop. about 969,000, giving about 1,262 to the square mile; over 30,000 of the population are nomads.

SIVA, *sē-va*, the third deity in the great triad of Hindu gods. His name signifies in Sanskrit "happy," "of good omen," and he typifies both destruction and reproduction, but is generally regarded as the deity in the character of destroyer. His worshippers are called **Saivas**, and they assign to him the first place in the Trimūrti or triad, attributing to him also many attributes which properly belong to the other deities. According to the **Saivas**, Siva is Time, Justice, Water, the Sun, the Destroyer and the Creator. He is represented in his characters of the god of regeneration and of justice as riding on a white bull. He has five heads; three eyes—one on his forehead, indicative of his power of contemplation; two, four, eight or 10 hands; and in the middle of his forehead a crescent. His throat is dark blue; his hair of a light reddish color, thickly matted together and brought over his head so as to project like a horn from his forehead. He wears a garland of human skulls around his neck, and as a second necklace, a serpent; and in his hand holds a trident, surmounted by a skull, and one or two human heads. He is often represented as entirely covered with serpents, which are the emblems of immortality. His weapons are the *Khinkhira*, of which nothing is known, a bow called *Ajakava*, a thunderbolt and an axe. He resides on the wonderful Mount Kailāsa, the northern peak of the Himalaya. One of his principal attendants is Tandu, a teacher of the arts of dancing and mimicry, whence Siva is the patron of dancers. Siva has more than 1,000 names, which are detailed at length in the 69th chapter of the *Siva-Purana*. These names are mostly all derived from his attributes and character. Among the exploits of Siva is recorded his having cut off, in a fit of anger, one of the five heads of Brahma. He likewise beheaded his father-in-law, Daksha, for having offended his wife; but on the interference of the gods he placed a ram's head on the headless trunk.

SIVA-SNAKE, the king cobra. See **HAMADRYAD**.

SIVAS, *sē-vās*, or **RHUM**, Asia Minor, (1) Capital of the vilayet of that name on the Kizil

Irmak, 170 miles southwest of Trebizond, on the site of the ancient Sebastia. It contains some fine ruins of Seljuk art, chief of which are the *medresses*, or colleges of the 13th century. One of them contains the tomb of Izz-ed-din Kai Kaüs I, the founder (1210-19). In the Armenian convent are preserved several relics, among them the throne of Senekherim. The heights (4,420 feet) are crowned by castles, and the general view, including mosques, minarets, colonnades, etc., baths, khans and bazaars, through which wind the narrow streets, is typically Oriental. There are Armenian churches, American and Jesuit schools and missions, and manufactories. On the route from Bagdad to Diarbeker and Malatiyeh and thence to the Black Sea, it is important commercially. The chief manufactures are coarse cotton cloth and woolen hose. The inhabitants are Moslems, Armenians and Greeks. Under Diocletian it became an Armenian capital, and was an emporium of wealth under Turkish dominion. In 1172 it was captured by the Seljuk sultan of Rhum. In 1400 when the city was taken by Timur it was a metropolis of 100,000 people; but never recovered from the atrocities perpetrated at that time. In 1895 a cruel massacre of Armenian Christians again decimated its population. Pop. 45,000. (2) Sivas is a large vilayet, and one of the most important of the country. Its area is 32,300 square miles. It has a productive soil; the main crops are wheat and barley; fruit orchards and vineyards are extensively cultivated. The forests are extensive, mainly fir, pine, oak and beech. The chief mineral deposits are silver, lead, salt, coal, iron, alum, arsenic and manganese. The exports include grain, flour, textiles, tobacco, opium, wool, carpets and cattle. The principal imports are cotton manufactures. The climate is salubrious. Pop. 1,090,000.

SIVASH, *sê-vâsh'*, or **PUTRID SEA**, Russia, a salt lagoon on the northeast coast of the Crimea. It is separated from the Sea of Azov by a narrow sand bar, is 68 miles long and has an area of over 900 square miles. It is very shallow, and its water is stagnant and very salt.

SIVATHERIUM, a great ungulate mammal, almost as big as an elephant, whose remains occur in good condition in the Pliocene (Siwalik) deposits of India. After much discussion its place has been decided to be with the giraffes, although it has many similarities to such aberrant "antelopes" as the pronghorn and the saiga. The male had two pairs of horns, supported on bony cores, as in living antelopes, sheep, etc. The front pair of horns (on the frontal bones) were of simple form, while the larger hinder pair (on the parietals) were large, palmated and much like those of a modern moose, but less expansive. Murie has suggested that the sivatherium, like the existing prong-buck, may have shed the sheaths of its horns annually; and this theory may account for the fact that the horn-sheaths have never yet been found in a fossil condition. *Vishnutherium* and *Hydraspothierium* are closely allied genera.

SIWAH, *sê-wâ*, or **SIVA**, Egypt, a small oasis 350 miles west-southwest of Cairo. It lies below sea-level and consists of a valley dotted by several lakes, prairies, palm groves, gardens

and fields, abundantly watered and enclosed by steep hills. It is the easternmost of a small chain of oases, very fertile, has an abundance of dates, melons, olives, pomegranates, grapes, beans, barley, wheat and rice, besides salt. Basket-weaving and agriculture are the chief industries. Artesian wells abound. Agermih is the chief town, built upon steep rocks, and contains some ruins of temples and deep wells. An Egyptian gate and a large room covered with hieroglyphics are supposed to belong to an ancient royal palace. Here was the famous temple of Ammon, at least 2,300 years old. In the vicinity is the Fountain of the Sun, a salty spring. Pop. 3,750. Consult Hohler, T. B., 'Report on the Oasis of Siva' (Cairo 1900).

SIX NATIONS OF THE IROQUOIS, The. The five Iroquois tribes—the Mohawk, the Seneca, the Onondaga, the Oneida and the Cayuga—speak dialects of the Iroquoian stock of languages. This stock is merely one of nearly 50 such linguistic groups on the American continent north of Mexico. This linguistic classification of languages into stocks does not by any means imply necessarily a community of blood descent among the peoples using the several dialects within each several stock, so that homogeneity of blood descent may not be consequently predicated of two peoples speaking dialects of the same stock. In the closing decades of the 16th century these five nations or tribes, or at least the main bodies of them, united in a defensive and offensive league or confederation under a constitutional form of government. It was a limited democracy, in which mother-rule was dominant.

The available historical data, although very meagre, make it probable that this act of federation was the last of a series of attempts to unite these and also other tribes in a permanent federal union. It may also be gathered from these same sources that the year 1570 A.D. is the approximate date of the founding of this remarkable league or confederation of the five Iroquois tribes or nations; the number was increased to six in the 18th century. At that time and for 200 years after they inhabited the central, the northern and the northeastern regions of what is to-day New York State.

Early French explorers and writers first called them the Iroquois; but when the exact geographic positions of these tribes became better known they named the Mohawk the Lower, and the four other tribes the Upper, Iroquois; but English authors, quite generally, knew them as the Five Nations. But, in 1722, the Tuscarora, a southern tribe, speaking a dialect of the Iroquoian stock of languages, became officially the sixth tribe of the federation or league of the Iroquois. Thenceforth, these six tribes (?nations) were usually called the Six Nations of New York Indians, often abbreviated to the Six Nations.

In 1535 A.D., Capt. Jacques Cartier, while exploring the Saint Lawrence River, obtained, from their Huron enemies, meagre but trustworthy information concerning the five Iroquois tribes, under the name "Troudamani" and "Agouionda." He learned that a state of cruel, desultory warfare existed not only among the five tribes themselves but also between them on the one hand and the Huronian and other allied tribes, then dwelling on the Saint Lawrence, on

the other. When Champlain, in exploring the Saint Lawrence River in the first decades of the 17th century, came in contact with the war-parties of the five tribes of the Iroquois, about 75 years after Cartier's time, he learned that they had so effectively harassed the Huron tribes who had formerly dwelt on the Saint Lawrence River as to compel them to withdraw to allied peoples then living on the banks of Lake Simcoe or to seek a precarious asylum among neutral tribes elsewhere. But, these Saint Lawrence regions, he found, were infested with marauding bands of the disrupted and dispossessed Huron peoples and of the tribes of Algonquian speech allied with them. These still stoutly disputed the Iroquois conquest of these territories. The dispossessed Huron tribes were sedentary, only leaving their villages and fields to hunt and to fish at certain seasons of the year. In 1622 Champlain attended a peace conference, at which were present Huron, Algonquian and Iroquois diplomats; it had been convoked for the purpose of bringing to an end a war which had then been waged, it was declared, for "more than fifty years." Peace was finally concluded in 1624. But in 1626 these Iroquois tribes were at war with the Mohegan who had a palisade "opposite Fort Orange (Albany, N. Y.), on Castle Island." Although inadvertently aided by the Dutch the Mohegan were defeated, and the Dutch commander and his men killed. It is said that some of the dead, including one or more of the Dutchmen, were eaten by the Iroquois. The peace concluded in 1624 with the Canadian tribes lasted for only about 10 years, for in 1634 these Iroquois tribes, or five nations of Iroquois, inaugurated a far-reaching policy which enabled them in subsequent years to overrun all Lower Canada and to take the first steps toward the entire subjugation of Upper Canada. The Algonquian tribes inhabiting the banks of the Ottawa River were either thrust back inland or entirely dispersed. In 1636 the five tribes or nations of Iroquois began a systematic raiding of the four federated Wendat or Huron tribes who lived around the shores of Lake Simcoe. And the complete political destruction of this Huron federation was accomplished during the summer of 1649. Then there followed the defeat and dispersal of the Tionontate or Tobacco Nation (Tribe). And in 1651 these Iroquois tribes attacked and utterly defeated the powerful Neuter Nation, the so-called Attiwendaronk, occupying what is to-day the southern peninsula of Ontario, Canada, and what is to-day western New York State as far as the Genesee River watershed.

These conquests made the five nations or tribes of the Iroquois complete masters of Upper Canada. And as a logical result they extended their sway over the conquered lands, held by the two tribes last mentioned, in what is to-day the State of Michigan. Then, in 1654-55, the war with the Erie took place; it ended with the complete political destruction of this intrepid people, for many of them became captives and were adopted as citizens of the commonwealth of their conquerors, while others fled to other tribes for asylum. These victories left the hostile tribes in the Susquehanna River Valley the only formidable enemies of the five nations or tribes at this time. Then, in this

region, there was a respite from warfare of about 20 years. In 1676 the Iroquois of the five nations vigorously attacked the Susquehanna tribes, especially the Conestoga ("Place Of Muddy Water"), who although supported by the Maryland authorities were nevertheless completely defeated and the valley of the Susquehanna became a highway for troops of Iroquois warriors going to attack the Virginia and Carolina tribes,—the Tutelo, the Saponas, the Achonechy (preferably Occaneechi), the Catawba, the Cherokee and other southern tribes with whom they had already been at war; the Conoy and the Shawnee were also subdued and brought under the dominion of the five nations of the Iroquois league or confederation.

Subsequent to 1680 the five nations of the Iroquois league attacked and defeated the Illinois tribes, driving some across the Mississippi River. In 1722 the Tuscarora became a sixth tribe or nation of the league or confederation of the Iroquois. Thenceforth these six tribes or nations were usually called the six nations of New York Indians, shortened sometimes to the six nations.

To commend and to secure their rule in the valleys of the Susquehanna and the Ohio rivers these six nations established a vast colonial policy, in pursuance of which they placed a vice-gerent on the Susquehanna and another on the Ohio to oversee and to advise the subject tribes in purely local affairs and to uphold federal law and to maintain federal rights and to secure justice by the reference of matters affecting these to the federal council at Onondaga.

The vice-gerent on the Susquehanna River was called Swatane by the Iroquois and Shikellamy by the Delawares. Both names signify "He enlightens us." The vice-gerent on the Ohio River was named Scarouady by the Iroquois and Monacatuatha by the Delawares. The Iroquois name signifies "Beyond the Sky." The meaning of the Delaware name is not definitely known. He was more frequently, however, mentioned as the Half-king. He lived first at Logstown, but in order to avoid the French influence he withdrew to Aughwick, Pa. It appears from the records that there were probably two in succession who held this office in the Ohio region. The first notice of such an official occurs in 1728, but of course this was not the historical date of the beginning of this unique native American policy. The so-called French and Indian War in the fifth decade of the 18th century brought this policy to an end. With the defeat of the Mohegan tribes on their eastern border in desultory warfare (1626-40) the Iroquois were finally able, about 1720, to bring the Delawares under subjection. They adopted them into the status of women, which by virtue of the very dominant civil and political position of Iroquoian women in their own social organization was not at all the act of humiliation that most writers on this matter have hitherto maintained. The position of woman among the Iroquoian peoples was rather one of power and respect, being in some measure superior to that of the warriors and the chiefs.

Champlain was drawn, largely by force of circumstances and ignorance of the spirit of the Iroquois tribes, into committing two costly

blunders which together finally deprived France of her Canadian colonies. The first was his joining a Huron-Algonquian war-party, in 1609, while on its way to raid the territory of the five nations of Iroquois. On the shores of the lake which to-day bears his name he met an Iroquois war-party, which he and his allies defeated largely by the strange firearms of the Frenchmen, by which three of the Iroquois chiefs were killed; the second and more serious mistake was made in 1615, when he led an invading force of French and Indians into the lands of the five Iroquois nations; he advanced into these lands to the region about the present site of Syracuse, N. Y. There he attacked a palisaded fortification for four days, but after being severely wounded in the knee by an arrow he and his baffled allies—Hurons and Algonquian warriors—were compelled to raise the siege. This unprovoked overt act—the invasion of Iroquois territory by these Frenchmen and Indians—aroused the undying hostility of these five nations of the Iroquois League against the French. They afterward consistently opposed the French at every step until the close of the French régime in Canada in 1764. Thus, these five, later six, nations became the firm friends of the English who were at that time often at war with the French. But this English alliance finally became the cause of the disruption of the unity of the league as pointed out elsewhere in these pages. The pretentious raids into the Iroquois country by Champlain, De la Barr, Courcelles, Tracy, Frontenac, Denonville and others never greatly embarrassed the activities of these five nations, so that they were never, or at least only temporarily, prevented from gradually extending their sway south, west and north among the native peoples, their neighbors.

Owing to the fact that the policies of this League of five nations or tribes were formulated, amended and executed by five tribal committees of astute chieftains in the federal council, the league with measurable success was able to weather all these wars and changes. But the war of the American Revolution ruptured the unity of this great institution. Some of the tribes, true to their long-standing alliance with her, espoused the cause of Great Britain, while a small minority, composed chiefly of the Oneida and about one-half of the Tuscarora with a few from other tribes, remained faithful to the American colonies. This peculiar situation resulted from a decision of the federal council of the league to remain neutral in the impending conflict, as a federation, but nevertheless to permit each tribe to choose for itself its own policy in the premises. So that as a result of the defeat of the English people parts of the league may still be found in New York State and in Canada.

The social organizations of the six nations of the Iroquois and their congeners were strikingly alike, although, naturally, there were noteworthy differences in details. On the whole many features of their social organization were not very different from those of like purpose among tribes having a similar social development. But the social organization of the six nations of the Iroquois and their kindred tribes of the Iroquoian linguistic family differed from those of most tribes of other linguistic

stocks in being measurably more complex, more expansive and more cohesive in its parts. A noteworthy difference between it and that of most other tribes is the dominant position and high public responsibility of the women who are mothers. This feature is a remarkable recognition of the nobility and the sacredness of motherhood. The chiefship titles, the lands and their products, and the lodges with their belongings are owned solely by the mothers of these people and these rights and prerogatives are ably administered by these very mothers.

Every candidate for a chiefship is named at a conference of the mothers of the *ohwachira* (uterine family) owning the title, under the premiership of the Matron of the *ohwachira*. The selection is then submitted for review and advice to the tribal and to the federal councils respectively. If the nomination is found satisfactory it is confirmed, but if it be rejected, the mothers aforesaid must again meet in conference in order to make another nomination. If necessary, this course must be repeated until a satisfactory candidate is found. The review is usually perfunctory; of course, the nomination is sometimes rejected, although the mothers naturally will present only such a candidate as they feel will be a credit to their *ohwachira*. After the institution of the league or federation the candidate had to be installed into office by federal officers at a federal condoling and installing assembly. This is a limited democracy in which the suffrage for the nomination of chieftains is confined to the mothers of the community.

In the original structure of the league or federation of the five (later six) nations no military officers were recognized. By amendment to the original instrument two of the federal chiefs (the one Onondaga and the other Seneca) were also made military officers. But it must be understood that these two officials could perform their military functions only outside of the sessions of the federal council. No federal chief could go on the warpath before resigning his federal chiefship, which he might resume on his return, if he was fortunate enough. There were three distinct classes of civil council chiefs among these tribes; they were the clan civil federal chieftains who while members of their local tribal council were at the same time also members constituent of the great federal council of the league or federation; and the two classes of clan civil chieftains,—the hereditary (the office but not the person) and the merit (or so-called "pine-tree" chief), who were the members constituent of their own tribal council only. But it must be noted that there was no such officer as tribal chief or chief of the tribe as an aggregation of clans known to the league, because the chieftain primarily represented only the *ohwachira* (uterine family) owning his title, the *ohwachira* being a constituent unit of the clan; the clan is, therefore, represented in council only by the chiefs of such of its *ohwachira* as may have chieftaincies. But sometimes there may be a clan in which no *ohwachira* may own a chiefship title and so it may not have representation in council.

The league or confederation as an institution or a form of government was an adaptation of that of the separate tribes even as that

of the constituent tribes was an evolution of that of the several clans which composed each. Lastly, the government of the clan was an adaptation and expansion of that of the several *ohwachiras* (uterine families) composing it, and the *ohwachira* or uterine family, strictly speaking, was composed of the progeny of an ancestral mother and her female descendants, reckoning the line solely through the female blood. Persons of alien blood could be adopted only into such a kinship group. So the clan may be defined as a permanent body of blood kin, socially and politically organized, who derive actual or fictional descent through the female line only, from a common ancestral mother. It is a fact that the less complex units of kindred surrendered part of their autonomy to the next higher units of organization in such manner that the whole was closely cohesive and interdependent. The institution of a higher kinship unit created new privileges, duties, rights and obligations. This was the principle of organization of the confederation of the said five (later six) Iroquois tribes or nations.

In nautical matters the five (later six) nations of Iroquois were measurably inferior to the Huron and the Algonquian tribes of Canada. The canoes of the former were constructed of elm bark and were of clumsier workmanship and they were no match for the beautiful birch bark canoes of the latter. So it is found that in most of the canoe fights mentioned in history these Iroquois tribes were usually worsted. After the establishment of the league or confederation the five federated tribes of Iroquois lost no time in making their united power felt. The evidence of this fact is found in the expulsion of the two Wendat (later Huron) tribes from their habitat on the Saint Lawrence River, about the close of the 16th century. When the Dutch traders established themselves at Fort Orange near the present site of Albany, N. Y., these Iroquois tribes obtained firearms from them and were thereby enabled to extend their conquests over practically all the neighboring tribes, in such manner that their sway was acknowledged from the Tennessee to the Ottawa River and from the Kennebec to the Illinois River and Lake Michigan; the Chippewa, however, checked their westward advance; the Cherokee and the Catawba and their allies effectually barred their further advance southward, while at the north they were much hampered by the operations and machinations of the French and their native allies. A list of the tribes against whom they raised the hatchet is simply startling. In brief, they attacked more than 28 Algonquian tribes, 12 Iroquoian tribes and at least three Siouan peoples. So that by 1664, when the English displaced the Dutch at Albany, the conquests of the league of the Iroquois or five nations had extended so far that the sway of these tribes was supreme over the native tribes in practically the entire valley of the Saint Lawrence River. In 1666 the five nations of the Iroquois league made peace with the French and their native allies who had attacked and burned some of their villages. Both parties to this peace observed it for a long period. The league was organizing to push its conquests

further south and west than they had previously done.

Their wars were waged primarily for the security of their homes and their hunting lands and for the perpetuation of their independence and political life, briefly, for the preservation of their institutions and for the welfare and integrity of their unique commonwealth.

The French in the latter part of the 17th century made a number of attempts through the Jesuit missionaries to induce the people of the five federated Iroquois tribes to break off their English alliance and to emigrate to Canada and to come under French jurisdiction. These attempts were so far successful that numbers from the different tribes, chiefly the Mohawk and Onondaga, left their former allegiances and formed Catholic settlements in Saint Regis, the Bay of Quinté, Oka, Lake of the Two Mountains and Caughnawaga, on the Saint Lawrence River. The tribes of the league, however, made repeated unsuccessful efforts to induce these emigrants to return to their former homes, and so in 1684, after realizing the futility of their efforts, they declared these emigrants traitors to the peoples of the league. The residue of the peoples of the five nations occupied their original habitats until the Sullivan raid in 1779 dislodged them and caused some to seek new homes elsewhere. Those who did not emigrate, live on reservations in New York State and those who did, live in Ontario, Canada.

The constructive principles of right and justice, underlying the institution of the league or confederation, defined primarily the rights and the obligations arising from blood kinship and affinity. Their internal and their foreign polity was molded and guided in consonance with these principles. The motive for the institution of the league was avowedly to secure universal peace and welfare (*Ne' Skèñ'no'*) among men by the recognition of the equality of rights and obligations among citizens of their commonwealth and the establishment of righteousness and justice (*Ne' Gā'hwī'io*) in directing and regulating personal and public conduct by them; and by the stopping of bloodshed through the proscription of the bloodfeud by the tender to the aggrieved family of the prescribed price for the killing of a cotribesman or cotribeswoman; by abstention from the eating of human flesh; and, lastly, by the maintenance and the effective exercise of power (*Ne' Gā'shasdon'sā'*), not only military strength but also the magic power (the *orenda*) believed inherent in the forms and words of their ceremonial, social and political activities. The tender by the offender and his family (*ohwachira*) to the aggrieved family (*ohwachira*) for the homicide of one of its members was 20 strings of wampum—10 for the dead person and 10 for the forfeited life of the offender; but, if the victim was a woman, 30 strings were required, as the value of a woman's life was held to be double that of a man.

The tribes in question were of course sedentary and agricultural, deriving only a portion of their subsistence from their hunting and fishing grounds. Skill and adaptability in lodgebuilding and in the construction of palisaded fortifications were marked characteristics

of these tribes when first encountered. In political organization and statesmanship, in military prowess and in the aptitude to found their institutions on universal principles of right and justice and mercy these five (later six) nations were second to no other native Indian people north of Mexico. The astute diplomats of France and England who at different times treated with their wily leaders found them their peers and exemplars in statecraft. Each tribe was an independent political unit and exercised the rights of local self-government, but in all federal affairs it acted jointly with its confederates through a federal council, composed of chiefs who were members of both the tribal and the federal councils. Every tribal (i.e., clan) chief was not a federal officer.

Before the great principles of the league or confederation of the five (later six) nations were constructively formulated into a system of interdependent federal institutions the avowed polity of these five (later six) nations of the Iroquois was a narrow tribalism which naturally regarded and treated all other people as game or as animal pests to be destroyed for the common good. This harsh, although orthodox, standpoint was not altogether changed by the universal principles of reconciliation and goodfellowship adopted as the working forces of the institutions of the league or federation by its great founders. So in the warfare of the league or federation prisoners were subjected to the most ferocious cruelty; unadopted women and infant prisoners were at times burned as alleged reprisals for similar treatment by their enemies. Yet, withal, they were not "a race of rude and savage warriors" but they were "a kindly and affectionate people, full of keen sympathy for kin and friends in distress, kind and deferential to their women, exceedingly fond of their children," anxiously striving for the establishment of peace and goodwill, righteousness and justice and mercy, among men, and profoundly imbued with a just reverence for the institutions of their federal commonwealth and for its noted founders and prophet statesmen and stateswomen.

The religion of these six nations or tribes of the Iroquois like that of all other peoples of this linguistic stock consisted in the recognition and the worship of unseen forces and beings whose expressions were embodied in all the environing objects and powers and phenomena and in many fictions of mythopoetic fancy, which, directly or remotely affecting their welfare or causing their illfare, were regarded as anthropic personages, in fact, as man-beings, endowed with human life, volition and peculiar orrenda (or magic power, which is the only impersonal concept of their philosophy). Form is the logos or expression of creative spirit. This makes it clear that the people of these tribes were not at all idolators in the usual sense of this much-abused term. This religion, however, placed emphasis on the punctilious performance of the rituals and the strict observance of the customs and ceremonies upon which these rest, rather than on theories of morals or ethics as such. Nevertheless, many of their ethical standards express ideals not yet attained by modern culture and civilization. Some have been formulated into

law. The orphan and the poor were not known as such in their polity. The food-supply—even the best of it—typified by a beaver's tail contained in a bark-bowl (the most delicious morsel known to them)—was made free to every person. The most desirable flesh was of the absolute right of every person who was a citizen of their commonwealth, their state.

In the pantheon of the Iroquois the status and the personal relations of the deities and personages thereof were naturally governed by regulations and customs, derived directly from those prevailing in the social and political organizations of the people, and so there is among the chief gods and goddesses of their faith a kinship system identical with the fabric of interrelated duties, obligations and immunities of the prototype—the kinship system of the people themselves. This is the psychology of the divine institutions of Iroquois faith.

SIXTEENTH CENTURY. This century is one of the most important in modern history, first as the terminal phase of the Renaissance, and, second, as the beginning of the religious upheaval called the Reformation, or more recently "The Religious Revolt in Germany." The still living spirit of the Renaissance made the

century a period of great art. Leonardo da Vinci and Raphael died not far apart (1519-20). The great Venetian painters, the Bellinis, Titian, Tintoretto, Veronese flourished, and such men as Correggio and Botticelli, not to mention a whole host of lesser lights, lived from the preceding century and did some of their best painting which has always been an inspiration. Architecture decayed to some extent, but it was in this century that Michelangelo built the great dome of Saint Peter's at Rome, and some of the finest Italian palaces were planned and constructed. Sculpture under the group of men from Michelangelo and Benvenuto Cellini to John of Bologna, achieved masterpieces that were to be forever famous.

Italy was not alone in this great development of the arts, for such men as Jean Goujon and Germain Pilon were distinguished as sculptors in France, and the châteaux of the Loire are enduring monuments of French architecture and great beginnings of French paintings were made. German painting had Dürer and the Holbeins and sculpture the Visschers and Adam Kraft. In Spain, as well as in the Netherlands, there came a fine initiative for the supreme period of their painting which was to follow in the next century. Only England was not touched by the art spirit of the time, though the response in literature in the magnificent Elizabethan period must be credited to make up for it. While it is not generally realized, the Renaissance evoked a great literature as well as a great art in all the countries of Europe. The development of this was somewhat delayed, and occurs in the 16th much more than the 15th century. It included Ariosto and Tasso as well as Vasari, Machiavelli, Lorenzo de Medici and Benvenuto Cellini in Italy; Marguerite of Navarre and the Pleiades, Ronsard, Rabelais and Montaigne in France, Cervantes and Lope de Vega, with Saint Teresa and the great mystical writers in Spain; and Camões in Portugal. The culmination of Renaissance literature came in the Elizabethan period in England. Michelangelo, poet as well as artist, died just two months before Shakespeare was born, and the two men are complements of each other at the extremes of cultural Europe. The Teutonic countries presented a great development of scholarship though not of original literature.

The art of the 16th century is, however, its greatest chapter. It contains all the work of Raphael, the greater part of that of Michelangelo, not a little of Leonardo da Vinci, most of Titian and all of Tintoretto and Veronese, not to mention a number of men who in any other period would be looked upon as of the very first rank. Raphael has been called the greatest painter of all time and while modern art criticism has discounted that flattery, scarcely any one would be ranked above him. When he died at the age of 37 he had reached distinction as an architect and archaeologist as well as a painter. Narrow specialism was extremely rare in the Renaissance and many men did many things well. Titian is one of Raphael's great rivals; some of his Madonnas are among the most beautiful in the world. Delacroix declared that he came closest to the spirit of antiquity. Another great painter of the time whose work is growing in appreciation in our time is

Correggio. Leigh Hunt declared him the most skilful artist since the ancient Greeks in the art of foreshortening. He was master of every technical device in painting and this was a time of fine technique. Tintoretto has been restored to modern estimation by Ruskin. Paolo Cagliari, known as Veronese, was a master of decoration and no decorative painter has equaled him in the effective use of color. It is easy to trace art decadence in the century but not difficult to understand it, once it is appreciated that at the beginning Botticelli was doing his famous *tondi* or *rondo*, Leonardo da Vinci was painting the 'Mona Lisa' and Fra Bartolomeo had just come under the influence of the Venetians and the spell of their rich color. It would have been almost impossible to expect that painting could be maintained on any such high level as all this indicates.

The century witnessed the career of the man often declared to have been the finest intellectual and artistic genius who ever lived, Michelangelo Buonarroti. He is the most distinguished of sculptors since the Greeks. Some of his painting rivals that of the very greatest painters. His decoration of the Sistine Chapel made him forever famous and has been the subject of reverend study ever since. As an architect he is undoubtedly one of the world's supreme geniuses in construction. Without steel or steam or any mechanical aid except a mule and an inclined plane, he built the great dome of Saint Peter's, one of the architectural wonders of the world. Meant to be seen as the first object visible in Rome to the travelers who, in the old days, came over the mountains in carriages or on horseback 20 miles away, it looks more like a work of the Creator than of the creature. This greatest of sculptors, painters, architects, has written sonnets that have only been equaled by Dante and Shakespeare and have never been surpassed. In every mode of æsthetic expression, he was a master in the highest sense of the word. After having worked hard all his life, he lived to be nearly 90 in the full possession of his faculties. His personal character is equal to his genius. He was a deeply religious man who all his life had been well known for his thoughtfulness for others. He left a sum of money in his will, the income of which was to be "given for the love of God to the modest poor." One of his sonnets is a prayer that he may not let himself become so occupied with the mere trifles of life as to forget that it is a preparation for another. Vittoria Colonna declared that those who admire Michelangelo's works admire but the smallest part of him. The artist is often a disappointment after his works; Michelangelo's personality had just the opposite effect. At the end he declared that "life, which had been given us without our asking, had wonderful possibilities of good in it, and death which came unsummoned from the same Providential hand could surely not prove less full of blessing."

The period is famous for its devotion to the arts and crafts. The furniture is noted for its charm of design and fine execution and was often designed by the great artists. Objects for church use were made the most beautiful works of art. A thurible or censor made by a pupil of Leonardo da Vinci sold at auction recently for some \$60,000 because it was thought

to be the most beautiful piece of bronze work of its kind in the world. Candelabra for church and home use, cups, plaques and other articles were made with similar perfection. Some of Benvenuto Cellini's work of this kind is very precious. Artistry was the keynote in every department of life. When Aldus published (1501) his Virgil in italics, the designer of the type was Francia, the famous painter at Bologna who had designed all Aldus' previous fonts of type. The home beautiful was the special cult of the time. The ladies of the Renaissance planned charming private apartments, music-rooms, art galleries and reception-rooms which reflected their personalities and are the most beautiful of their kind ever created. Some of them have been reproduced in modern museums in the hope of stimulating emulation. The apartments of Lucrezia Borgia at Ferrara were particularly famous. Landscape architects made the gardens surrounding these houses beautiful and artists were appealed to to plan details of all kinds so as to be sure that all would be beautiful as well as useful.

Painting outside of Italy flourished wonderfully and the names of Albrecht Dürer and the Holbeins in Germany, of the Clouets, Cousin and Fouquet in France and of Navarete, of Juan Bourgonia, of Louis de Vargas and Pablo de Cespedes in Spain, as well as Mabuse, Van Orley, Blondeol and Justus of Ghent in the Netherlands all live in honor among those interested in the history of art. In sculpture there is a distinct descent from the preceding century, except for some great work of Leonardo da Vinci and Michelangelo, but the sculptures of John of Bologna and Benvenuto Cellini deeply influenced succeeding generations and are greatly admired in our time. In France, Goujon's reliefs for the Fountain of the Innocents are among the most beautiful works of their kind ever produced. Germain Pilon's group of the Three Graces is a monument to the refined tastes of the time, and to the genius of the sculptor, even though it may show signs of the beginning of decadence. In Germany the great group of figures for the monument of the Emperor Maximilian at Innsbruck, executed early in the 16th century, shows how high were the standards of plastic art everywhere at this time. Saint Sebald's tomb, executed by the Vischers, father and son, at Nuremburg remains one of the unapproached marvels of a great period. There were many foci of fine artistry in southern Germany during the period.

The Elizabethan Period in English literature is, with the art of Italy, the twin triumph of the century. It holds all of Marlowe's writing and up to the very flowering of Shakespeare's genius. It has, besides, the poetic beauties of Sidney and Spenser, the marvelous English of Chapman's translations and the best of Ben Jonson's dramatic work. It is not only the greatest period of literature in English, but one of the greatest periods of world literature. The English people were extending their domains beyond the sea. The peril from the Armada had deeply stirred the English mind and the reaction after the victory gave a great stimulus to thought and writing. As is so often the case when the country was growing in national importance, intellectual genius bloomed also and so "the spacious times of great Eliza"

furnished a stimulus that was well responded to. A very great period of dramatic literature developed quite unexpectedly, continued for a generation and then began to decline. By the end of the second generation the inspiration had faded and only conventional work was being done.

This century saw a wonderful outburst of European literature, culminating in the latter part. The Elizabethan period in England was rivaled in other countries. In Portugal Camões wrote 'Os Lusíadas,' the epic story of Portuguese exploration of Africa and Asia and of the foundation of Portugal's Indian empire. Friedrich Schlegel declared it the greatest epic of modern times. In Spain came the beginnings of the careers of Lope de Vega and Cervantes; in France Rabelais, at the beginning of the century, Montaigne, at the end, did their work; in Italy Ariosto and Tasso. Had Shakespeare visited the Continent as a young man he might have met nearly all of these. The writers of the most humanly interesting play, 'Hamlet,' of the greatest novel ever written, 'Don Quixote,' of the greatest modern epic, 'Os Lusíadas,' of the greatest letters (Saint Teresa) and the greatest essays (Montaigne) were all doing their work together in the last quarter of this century. Some of them were to accomplish their best work only at the beginning of the next century, but their inspiration came from this.

The cultural development of the Spanish-American countries during the century is one of the surprises of recent historical research. Schools were established in Mexico and Peru during the second quarter of the century and in 1551 the universities of Mexico and Lima received royal charters. During the last quarter of the century, medical and law departments were organized and these universities had many hundreds of students. The printing press was introduced into Mexico (1536) and the first book printed was 'La Escala Espiritual' ('The Ladder of the Spirit') the following year. Seven printers plied their craft in the century. Professor Bourne of Yale declared that Mexican scholars before the end of this century "made distinguished achievements in some branches of science, particularly medicine and surgery, but especially linguistics, history and anthropology." In the following century there were chairs in all the sciences and "some of the professors, notwithstanding the vast distance, gained the applause of the litterati of Europe. In range of studies, in standard of attainments by the officers, the Mexican institutions of learning surpassed anything that existed in English America until the 19th century." (Bourne). The university was granted by the Crown an income of about \$10,000, so that considering the value of money, apart from fees and other sources of revenue, it had the equivalent of an income of \$100,000 a year in our time.

The most fascinating character of the century whose work has lived on after him and has deeply influenced the after world is Ignatius of Loyola. A Spanish soldier, wounded at the siege of Pamplona by the French in 1521, he had his leg rebroken when it had healed in bad position, bearing the awful pain in those pre-anæsthetic days, rather than have his pride annoyed by the deformity. During the en-

forced idleness he read, after exhausting all the romances of chivalry at hand, a life of Christ and lives of various saints, particularly that of Saint Francis of Assisi, and came to the conclusion that life was only worth living when lived in imitation of the God-Man. Amidst many almost incredible difficulties, for more than a dozen years he formed his character by spiritual exercises, took up the study of grammar in a class with little boys, supported himself by begging as one of the beggar students of the time, and gathered around him at the University of Paris a group of seven men, who in 1534 took their vows with him as members of the Company of Jesus. With true Spanish chivalry, their first object was to win over the Holy Land from the infidels by going to Jerusalem and converting it. Prevented by war from doing this, they became teachers and missionaries in Italy. Their zeal was so great and yet so reasonable, they were so absolutely unselfish and had a charm that attracted so much attention, that they accomplished wonders. The Pope received them with kindness and gave them provisional confirmation of their rule. Pope Paul III had insisted on limiting the number of religious orders because of abuses that had arisen in them, but after reading Ignatius' rule he declared "the finger of God is here," gave them the fullest confirmation and in 1543 they were acknowledged as one of the religious orders of the Church.

The Jesuits, thus simply founded, proved to be one of the creations of that great period most far-reaching in influence. By the end of the century they had schools in nearly every country of Europe, with many thousands of pupils. A hundred years later they had some 200,000 pupils. They went as missionaries to China and Japan, Mexico, Peru, Brazil, Paraguay and Chile, to Farther India and to the North American Indians. They wrote many thousands of books and their bibliography contains over 11,000 authors. The list of Bellarmine's works fills 50 pages, double column, one of them published in 54 languages. They were discoverers in astronomy, founders in anthropology and ethnology, writers on every scientific topic, and Poggendorff has 500 of them in his 'Biographical Dictionary of Science.' The last prayer of Ignatius was that his order should be persecuted. As Francis Thompson said, "Most singular bequest that a founder ever transmitted, it has been singularly fulfilled." Suppressed by the Pope in 1773, they survived in Russia, were restored in the early 19th century and there are over 20,000 Jesuits in the world now.

The most disputed character of the century is Martin Luther. Lord Acton once declared his life the most difficult problem in historical writing. The movement initiated by him separated the Teutonic peoples from the Pope and then made their monarchs the head of both Church and State (*Cujus regio ejus religio*). There had been unfortunate abuses within the Church and many felt that these could not be corrected without breaking away from Rome. A number of deeply religious people followed Luther out of the Church for this reason. Political motives and the confiscation of the property of the Church and of the religious orders helped the movement. Sweden affords a typical example of this. Most of this property had

been held in trust for the poor and for education. In the religious conflict which followed, social organization for the benefit of the poor and education suffered severely. Fewer universities were founded, the attendance was smaller, intellectual life declined (Erasmus), there was less academic freedom (Paulson). Luther's doctrine of liberty of judgment and personal interpretation of the Scriptures soon led to a multiplication of sects, each bitterly opposed to the others. Calvin in Switzerland and Knox in Scotland are as difficult to estimate properly as Luther. They too gathered round them many of those in their environment most deeply interested in religion. Rev. Dr. Briggs suggested that there were other and greater reformers in the century than these popular heroes. He mentioned Sir Thomas More, Erasmus and John Von Staupitz as "the three irenic spirits . . . the beacons of the greater reformation that was impending." Luther's movement began a reaction for sadly needed reform in the Church which was directed by the Council of Trent (1545-63). Henry VIII, after having received the title of Defender of The Faith for writing against Luther, broke with Rome over the affair of Ann Boleyn and became by act of Parliament the head of the Church as well as of the State. The Anglican Church as such did not come into existence until under the boy king, Edward VI (1547-53). Queen Mary (1553-58) restored Catholicism. Anglicanism was firmly established by Elizabeth (1558-1603).

The Protestant Reformation undoubtedly brought about a great reawakening of personal religion and aroused the clergy to an ampler sense of their duties in leadership with regard to their flocks. Religion had come to be for a great many people a convention, lacking those personal elements of relationship between man and his Creator which foster the spiritual life. The Renaissance served to set the intellect of Europe rather definitely against religion, though its great leaders were exceptions to this and a profound reawakening of the spiritual life of the people was needed. The movement is too close to us even yet to be properly appreciated in its entire significance though the World War has helped to its understanding.

The greatest accomplishment of the century was in exploration and colonization. The expedition of Bartholomew Diaz around the Cape of Good Hope to India (1487) and Columbus' discovery of America initiated a great period. The Cabots touched the American continent at the north and Vespucci at the south just before the century opened. Magellan's vessels sailed around the world, though he lost his life on the way. Verrazano, an Italian with a French expedition, sailed along the coast of North America and entered the harbor of New York (1524). By the mid-century many of the islands of the Pacific had been discovered, including Australia; the Portuguese laid the foundation of their great empire in India, and Pizarro and Cortes had founded the Peruvian and Mexican possessions of the Spanish Crown on the American continent. By the end of the century there was free European intercourse with the East and the West and the riches of both these wealthy portions of the world were pouring into Spain

and Portugal, stimulating an intense national life which gave rise to a great literature in both countries. England was preying upon the commerce, particularly of Spain, enriching her people and preparing to take up colonization for herself at the beginning of the next century.

The century witnessed the foundation of modern music. The greatest genius of it is Palestrina. He is to music what Dante is to literature and art, and whenever he is properly appreciated that generation has a good musical taste. The beginnings of the century's music comes from Flanders. Archadelt, the master of Palestrina, wrote some church music which is still used. Claude Goudimel, another Fleming, influenced his time deeply and as the master of Orlando di Lasso, the first to co-ordinate words and music so as to harmonize and bring out the meaning of both, influenced all the after-time. Other pupils of Goudimel were the brothers Animuccia who created the *Oratoria*, named in honor of the oratory of Saint Phillip Neri, their great friend, at Rome. Josquin (Josse Despres) in France and Hans Sachs in Germany laid the foundation of modern popular song music and foreshadowed many subsequent developments.

The foundations of the physical sciences were laid broad and deep in this period. The greatest scientific discovery is that of Copernicus, who revolutionized man's thinking as to the universe more than any other who ever lived. He did not make many observations nor were those he made particularly exact, but he reached a magnificent generalization, the Copernican theory, which has come to be the accepted teaching as to the universe. His theory was not acceptable to his generation and practically all the mathematicians and astronomers objected to it. It was not generally accepted until the generation after Galileo in the following century. Copernicus' studies had been made in Italy; it was there, according to tradition, that he first hinted of his theory, and when he published his book it was dedicated with permission to Pope Paul III. Until Galileo's unfortunate insistence on teaching the theory as absolute science, there was no hint of opposition. Copernicus' greatest scientific contemporary was Leonardo da Vinci, whose work in science belongs to this century (died 1519). Leonardo discovered capillarity and diffraction, made observations on resistance, on density, on the weight of air, on dust figures, on vibrating surfaces and on friction and its effects. Duval has claimed a place for him in the history of the biological sciences for his original observations in botany, zoology, palæontology and physiology. He developed practical engineering, studied the problems of flying and made a series of very practical inventions. He was a zealous dissector and made sketches of his work which, rediscovered in recent years, show clearly that his proposal to write a textbook of human anatomy was quite serious.

The biological sciences developed strikingly, beginning with Vesalius, the "father of modern anatomy," who wrote a great textbook, magnificently illustrated, and still one of the bibliophilic treasures of medicine. His pupil, Columbus, working as a papal physician at Rome, discovered the circulation of the blood in the lungs, and one of his successors in the Papal

University, Casalpino, described the circulation of the blood in the body. In the meantime, Servetus, a Spaniard working in Paris, had written a description of the circulation in a theological work on the Trinity, for which, unfortunately, he was put to death by Calvin at Geneva.

Many other important discoveries were made in Italy at this time. The names of Eustachius, Fallopius, Varolius, Sylvius, are forever enshrined in the history of medicine because of structures named after them which they were the first to describe. After anatomy, botany developed the most and Cæsalpinus, the anatomist, is called by Linnæus "the first systematic botanist." Many of the universities had botanical gardens of their own and collections of plants for study were made. The great names in botany are Valerius Cordus, Conrad Gesner and Leonard Fuchs. Before the end of the century, the calendar was corrected under Pope Gregory XIII to the form we now have and some extremely important developments in practical medicine and surgery had been made. Italy was the great Mecca for enthusiastic students of science and Copernicus, Linacre, Vesalius and Caius in the early part of the century as Harvey later went down there to do special work. Padua was the most famous university of the world and almost no ambitious young university man in another country felt that he could count himself fortunate unless he had been there.

One of the supremely great men of history was Sir Thomas More (beheaded 1535). A close personal friend of King Henry VIII, he was sent on an embassy into the Netherlands (1516), and while there wrote 'Utopia,' probably the most interestingly practical of the books on ideal republics ever written. He had been, before this, one of the group of men, including Erasmus, Linacre and Dean Colet, most prominent in the Renaissance in England. Erasmus thought him one of the greatest minds of the time. On the fall of Wolsey, Henry VIII insisted on making More, Lord Chancellor. Wolsey declared him the most suitable to be his successor, but the post was accepted not without misgivings on the part of More. His well-known sympathy for the poor and his sterling uprightness of character had made him popular, so that his installation took place "to the joy and applause of the whole kingdom." His career fulfilled expectations. He is the only man who ever cleared the docket of the Court of Chancery. More refused to take the Oath of Supremacy, that is, that the king was the head of the Church. Practically all the bishops of England except John Fisher had consented to take the oath by some evasion of conscience, but More persisted in refusing. He was executed for treason going to the scaffold with a joke on his lips. Lord Campbell ('Lives of the Lord Chancellors') says, "Considering the splendor of his talent, the greatness of his acquirements and the innocence of his life, we must regard his murder as the blackest crime that has ever been perpetrated in England under the form of the law." He adds, "The mean, sordid, unprincipled chancellors who succeeded him made the latter half of the reign of Henry VIII the most disgraceful period in our annals."

The century embraced the careers of a number of women in whom interest has never died. The list includes Vittoria Colonna and Marguerite of Navarre who corresponded with each other, Isabella and Beatrice d'Este, Saint Teresa, Lady Jane Grey, Mary Queen of Scots, Queen Elizabeth, Margaret More, Charitas Pirkheimer and Angela Merici, not to mention any but those whose lives are still felt. Queen Isabella of Spain lived on into the century but her work was done mainly and has been treated of in the 15th century. Vittoria Colonna, called the Saint of the Renaissance, was a wonderful character of fine intelligence and broad education who deeply influenced her own and subsequent generations. She wrote some religious poetry that is still republished, but it was her personality that counted. Her deep impression on Michelangelo in his old age, as demonstrated by his sonnets to her, some of the greatest ever written to a woman, reveal her power. The contrast to her would seem to be Lucrezia Borgia, whose name has become the byword for all that is worst in feminine human nature, but Gregorovius has vindicated her. Her contemporaries deeply loved and respected her. Aldus, the great printer, who knew her well, praises her charity to the poor, her unselfish devotion to the afflicted and her ability as a ruler. Chevalier Bayard, *sans peur et sans reproche*, declared "that neither in her time nor for any years before has there been such a glorious princess." When she died at the early age of 40, all of Ferrara, where the last 20 years of her life were spent, followed her body to the tomb as that of a saint. Her popular reputation is a lesson of the fallibility of historical traditions without contemporary documents.

Saint Teresa of Spain has been called the greatest of intellectual women. Her works are still issued, edition after edition, in many languages. A number of 'Lives' of her have been written, even in English in this present century. Cardinal Manning, himself the most practical of men, declared that "she was one of those sovereign souls that are born from time to time, as if to show what her race was created for at first and to what it is still destined." The Spaniards call her their Doctor of the Church, and her statue, the only one of a woman, is among the Fathers and Doctors of the Church in Rome, with the title *Mater Spiritualium*. She is the world authority on mystical theology and an unsurpassed writer of Spanish prose. It has often been said that from behind her convent grill she, more than any other, was the barrier against that divisive religious movement which caused such bitter dissensions in most other countries of Europe, but spared Spain. In striking contrast to her is Marguerite of Navarre, sister of Francis I of France, herself a queen, whose volume of stories, the 'Heptameron,' is still popular in every language, while her poems, 'Les Marguerites de la Reine Marguerite' are known to all lovers of literature. She had an extremely beautiful character and radiated the finest influence over her generation. In order to neutralize the evil done by certain immoral stories current at court in her time, she retold them in literary form, adding morals to them. Like so many good people, she had the idea

that human passions may be influenced for the better by sweet reasonableness. Instead of doing good, her book has done harm. Most people read the stories and not the morals, or when they read both, forget the morals promptly, while the evil suggestions remain.

Mary Queen of Scots is one of the much-disputed characters in history. After 18 years in prison, she was beheaded, at the age of 44. She was crowned queen of Scotland as an infant on the death of her father, James V (1542). At the age of 16 she was married to the Dauphin of France. Her husband became king as Francis II of France when she was 17. He died the next year and at 19 Mary returned to try to rule the turbulent Scottish barons. At 25 she was imprisoned and was released for two weeks only, when she threw herself on Elizabeth's mercy, who kept her in prison until her execution. She lived in the most difficult of times, and this brilliant intellectual woman, whose heart sometimes led her astray, is a type of the Renaissance. Her successful rival for the throne of England, for on Queen Mary's death Mary of Scots had claimed the English throne as well as Elizabeth, is a greater genius without heart. She had the discernment to gather around her the men who laid broad and deep the foundations of modern England, and its colonial empire. The "Good Queen Bess" of traditional history has suffered severely from modern historical research. She was a woman of great administrative ability, but of lamentable personal character. Prescott say of her, "she was haughty, arrogant, coarse and irascible, while with these fiercer qualities, she mingled deep dissimulation and strange irresolution. . . . She was desperately selfish, incapable of forgiving, not merely a real injury, but the slightest affront to her vanity, and she was merciless in exacting retribution." She had her father's Tudor character, but his genius for managing men.

The founder of feminine education in the century was Angela of Merici. A young woman of the lower middle class, of a small town of Italy, she recognized that not only the better class women but all women needed to be educated in order to bring up their children properly and influence those around them for the best. She established a little community for the teaching of girls. Under her direction this movement spread and she wrote a rule for the women who had come to share her work. In approving this constitution, Pope Paul III said to Saint Ignatius, the founder of the Jesuits, "I have given you, sisters." The Ursuline schools spread over Italy in a single generation and they had houses in Paris and Bordeaux in the second half of the century. They opened a school in Canada in 1639 and one in New Orleans in 1726. They were the first to offer more than a common-school education for girls, in the northern United States at least, though their house at Charlestown, Mass., was burned down by a mob in 1834. Most of the pupils at the convent at the time were from some of the old Puritan families of New England. The Ursulines have taken up college work for women in our time very successfully and they have schools all over the world with many thousands of members at work.

The most important historical event of the 16th century is the battle of Lepanto (1571), which marked the definite defeat of the Turks and put a period to the long fight between Christians and Mohammedans which had been in progress for nearly a thousand years. Pushed out of Spain and halted in the Balkan region, the Mohammedans had gradually acquired dominion in the Mediterranean Sea, had taken Cyprus and almost succeeded in capturing Malta from the Knight Hospitallers who defended it with a dauntless courage which finally gave them the victory. Something had to be done to stay their progress. Thousands of Christians were being captured every year by Turkish pirates and held as slaves in the cities of the Barbary Coast or even being sold into the East. The Turks were making incursions on coast cities with great destruction and loss of life. Under the inspiration of Pope Pius V, an alliance was formed between the Venetians and Phillip II of Spain, whose commerce had suffered most, and they gathered an immense fleet. Don Juan of Austria, Phillip's half brother, just then the popular military hero of Europe because of his recent success in a crusade against the Moors, was in command. The Christians met the Turkish galleys in the Gulf of Lepanto on the western coast of Greece and utterly defeated them. This broke the power of the Turks on the sea forever. Though in the next century, the Turks advanced as far as Vienna and besieged the city, they were never the real danger to Europe that they had been before Lepanto. Besides the commander-in-chief, the one name now remembered from the battle is that of Cervantes, the author of 'Don Quixote.' He was wounded while bravely fighting, though on the morning of the battle the physicians had ordered him to stay in bed because he was suffering from fever. He was very proud of his wound and liked nothing better than to be known as "the maimed soldier of Lepanto." He was afterward captured and sold as a slave among the Mohammedans. This slave making continued, though in ever-decreasing importance, until the young American republic, at the beginning of the 19th century, inflicted severe defeat upon the Mohammedan pirates.

The best-known event of the century, because of the endless disputes as to its significance, is the massacre of Saint Bartholomew's Day in Paris, 24 Aug. 1572. A great many Huguenots were murdered under the direction of the government, with sad disgrace to France. Catherine de'Medici, the widow of Henry II, and the mother of the three kings who succeeded each other rapidly at this time, Francis II, Charles IX and Henry III, is undoubtedly responsible for it. Since Ranke's declaration on the subject, most historians have agreed that there was no deliberate premeditation of the massacre. Catherine was angered at Admiral Coligny and in a spirit of revenge resolved to do away with him. Assassination by governmental order was still not repudiated in most countries. Coligny's assassination was attempted 22 August, but failed. In her alarm over the failure, Catherine worked upon the fears of her son, Charles IX, that the Huguenots might in revenge bring about counter attacks and had him order a massacre in which

Coligny would surely be included. Only the leaders of the Huguenots were to have been put out of the way, but in the mob spirit that ensued a great many others were killed. Many rich people became victims, their houses being pillaged regardless of their religious opinions. Mezeray declared that to have money or enviable position, avaricious heirs made almost any one a Huguenot at this time. The number of the victims is not known. Ranke estimated that 2,000 fell in Paris and larger estimates than this are undoubted exaggerations. The 'Martyrologie des Huguenots' mentions less than 1,000 dead. There had been religious wars in France between the Huguenots and Catholics in 1562-63, 1567-68 and 1569-70, and it was hoped that this might put an end to the civil strife, but it only inveterated it. Lyons, Toulouse, Bordeaux and Rouen all had massacres later than Paris, Toulouse 23 September, Bordeaux, 3 October. The lack of simultaneity shows that the massacre had not been planned but was a sudden decision. Charles IX sent a message to his Ambassadors throughout Europe: "Coligny and his followers were all ready to visit upon us the same fate that we dealt out to them." The French magistrates ordered thanksgiving every year on 24 August in gratitude for the timely discovery of the conspiracy. The Pope, told that the French king and his family had been saved from a conspiracy, ordered thanksgiving, but when he learned the truth he refused to receive the man who had fired on Coligny, saying, "He is an assassin."

At the beginning of this century the condition of the people generally may be judged from conditions in England a generation before. Fortesque, Lord High Chancellor, gives a striking picture of the times quite incredible but for his authority. He said "The inhabitants are rich in gold, silver and in all the necessities and conveniences of life. They drink no water unless at certain times, upon a religious score, and by way of doing penance. They are fed in great abundance, with all sorts of flesh and fish, of which they have plenty everywhere; they are clothed throughout in good woollens, their bedding and other furniture in the house are of wool, and that in great store. They are also well provided with all sorts of household goods and necessary implements for husbandry. Everyone according to his rank, hath all things which conduce to make mind and life easy and happy." By the end of the 16th century religious conflict had sadly disturbed social conditions. The rights of the people were trampled under foot and the hard won privileges of the Middle Ages were lost. Such social institutions as the guilds, hospitals and various organizations for the care of the needy suffered most. The decline in social service which began in this century reached a climax that brought reaction only in the 19th century. Education suffered almost as severely as social organization for the times were too disturbed to permit of proper attention to intellectual matters and religious controversy consumed mental energies.

JAMES J. WALSH,

Author of 'The Thirteenth Greatest of Centuries'; 'The Century of Columbus (1450-1550),' etc.

PRINCIPAL EVENTS OF THE SIXTEENTH CENTURY.

- 1500-01. Portuguese discover Brazil.
 1502. The island of Saint Helena discovered.
 1509. Henry VIII of England began to reign.
 1515. England and Scotland at war. The battle of Flodden.
 1517. Martin Luther began the Reformation in Germany.
 1519. Leonardo da Vinci dies.
 1520. Raphael dies.
 1521. Luther at the Diet of Worms. Turks take Belgrade.
 Henry VIII of England is titled Defender of the Faith by the Pope.
 1522. Circumnavigation of the world completed by Magellan.
 1524. Verrazano entered New York Harbor. Holbein the Elder died.
 1525. Francis I, king of France, taken prisoner at the battle of Pavia.
 1527. Rome taken and sacked by the French under the Constable of Bourbon.
 1528. Dürer, the renowned German artist, dies.
 1529. Henry VIII quarrels with the Pope over his refusal to grant a divorce.
 1533. Henry VIII of England divorces Catherine of Aragon and abolishes papal authority in England.
 1534. Ignatius Loyola founds the Company of Jesus.
 1535. Church of England founded. Sir Thomas More beheaded.
 1536. Printing introduced in Mexico.
 1539. The Bible printed in English. Monasteries suppressed in England and Wales.
 1543. Copernicus published his theory of the rotation of the earth round the sun.
 1545. The Council of Trent began 13 December and lasted 18 years.
 1546. Socinianism sprang up in Italy.
 1547. Cervantes, the celebrated author of *Don Quixote*, born.
 1551. Universities of Mexico and Lima chartered.
 1553. Queen Mary restores Roman Catholicism in England. Servetus burned at Geneva. Rabelais dies.
 1557. Charles V of Germany resigns the crown.
 1558. Elizabeth becomes queen of England and restores the Protestant Church. France recovers Calais from the English.
 1560. Presbyterianism established in Scotland.
 1564. Michelangelo, the most prominent artist of the Renaissance, dies. Shakespeare born. Vesalius, the father of modern anatomy, dies.
 1564. Puritan party founded in England.
 1566. The 39 articles of the Church of England formulated.
 1568. Mary, Queen of Scots, imprisoned in England. The Reformation introduced in the Netherlands.
 1571. Benvenuto Cellini, the famous Italian sculptor, dies. Defeat of the Turks at the battle of Lepanto.
 1572. Massacre of Saint Bartholomew in Paris.
 1576. Titian dies.
 1580. Sir Francis Drake sailed around the world. Camões the great Portuguese poet dies.
 1582. Pope Gregory adjusts the Julian calendar and advances 5 October to 15 October in Catholic countries.
 1585. Raleigh established the first English colony in America.
 1587. Mary Queen of Scots beheaded. Drake destroys 100 sailing ships in Cadiz Bay.
 1588. The invincible Spanish Armada destroyed by the British. Duke of Guise assassinated.
 1589. Henry IV of France begins to reign.
 1590. Battle of Ivry. Jansen, a spectacle maker in Germany, invents the telescope.
 1591. Watches introduced in England from Germany.
 1594. Palestrina, founder of modern music, dies.
 1595. Tycho Brahe defines the obliquity of the ecliptic.
 1598. Edict of Nantes. Tyrone's rebellion in Ireland.
 1600. Incorporation of the East India Company.

SIXTH CENTURY. This century was a time of sad confusion and distress, but in the midst of it the first hints of the beginnings of modern Europe as we know it may be traced. The Franks succeeded in establishing themselves under Clovis in a kingdom which embraced a considerable part of what we now call France and Germany. The country was unsettled, and though Clovis and his people were formally converted to Christianity, the process of real Christianization had only just begun. The Vandals, originally a Germanic tribe from the regions near the Baltic Sea, after their invasion of Italy, moved over into Spain and conquered a kingdom there, the word Andalusia being a modification of their name, but they were pushed out of the peninsula by the Suevi and the Visigoths and then established a kingdom in northern Africa. Their

original removal from their homelands on the Baltic had probably been due to the intrusion of Slavonic tribes coming from the east and north of them, who in their progress also dislocated the Lombardi (Lombards). These made their way down into Italy and have left their name on the northern portion of it. At the close of this century, the northwestern part of what is now Spain and Portugal was the kingdom of the Suevi, the rest of the peninsula with southwestern France being the kingdom of the Visigoths (West Goths). Northern Italy, Austria and the northwestern Balkan States constituted the kingdom of the Ostrogoths (East-Goths), the Franks held a kingdom stretching along the Channel and including northern and eastern France and most of the Netherlands, while the kingdom of Burgundy represented central and eastern France. The Britons of Celtic origin, under separate rulers, occupied southwestern England and what is now known as Brittany in France. These kingdoms of the barbarians were not, as might be supposed, always disturbed dominions, for one of the greatest rulers of this century is Theodoric of Verona (Dietrich of Bern of the German legends) who ruled the Ostrogoths in Italy (493-526) and gave that unhappy country, whose fairness attracted the barbarians, its one generation of quiet and prosperity since the death of Marcus Aurelius. Before the 6th century closed, men told of Theodoric's reign in Italy the same story that was told in England of Alfred's time, that law was so well enforced that gold pieces could be left on the highway without being stolen. The kingdom established by him lasted scarce a quarter of a century after his death. It was overthrown by the armies of Justinian, and Italy was once more united with the Eastern Empire 533.

The statesman of the century is Cassiodorus, born in southern Italy about 490, died about 583. He attracted the attention of Theodoric by a panegyric on that monarch who in recognition appointed him *quæstor* when he was about 21. Cassiodorus continued to be the councillor of that king until his death in 526 and then became prætorian prefect under the regency of Amalswintha. The Goths in Italy were being overcome by the Eastern Empire, however, and Cassiodorus at the age of 50 decided to retire. Some years before Benedict had founded his great monastery at Monte Cassino and following his example Cassiodorus founded a monastery on his estate at Vivarium. Here he continued to write for more than 40 years. He gathered together a large library of books, encouraged the monks in their use, outlined studies and by example as well as precept gave a great impetus to classical scholarship. Having during his public career tried to reconcile the two races, the Goths and the Romans, in his religious retreat he labored with greater success to harmonize the culture of the ancient and the Christian world. He had broad, deep interests in all departments of artistic effort and deeply influenced the music of the time. His work *Institutiones Musicæ* is particularly valuable for the knowledge of the early beginnings of the music of the Church. With his contemporary Boethius he is the chief exponent of the theory of music between antiquity and the early Middle Ages. The man

of Theodoric's reign whose personality lived on to affect men deeply is Boethius (475-524). He was the greatest intellectual genius of the period and his writings widely influenced the students of a thousand years until the end of the Middle Ages. He was put to death by Theodoric on a charge of treason, though it seems likely that there were religious motives involved—Theodoric was an Arian—and Boethius is often hailed as a Christian martyr. His 'De Consolatione Philosophiæ' was the most read book of the Middle Ages. It was translated by King Alfred (9th century) and by Chaucer (14th century) and influenced Dante more deeply than any other book except the 'Summa' of Aquinas. It has the interest of Marcus Aurelius' 'Meditations' and while containing no reference to formal religion was a not unworthy predecessor of Thomas à Kempis.

The greatest ruler of the century is Justinian (483-565) surnamed the Great, the Byzantine emperor (527-565). His reign was stormy partly from internal dissensions, but mainly because of the incursions of the Persians who had to be bought off at first (531). His generals suppressed the rebellion at home, though not before Constantinople had suffered severely, and then conquered the Vandal and Ostrogoth kingdoms in Africa and Italy, restoring these countries as provinces of the empire. Belisarius saved the empire by his thorough defeat of the "Green" party,—the name was adopted from a horse racing faction—at Constantinople in 532, overthrew the African Vandals (534), conquered Sicily (535), southern Italy (537), recaptured Ravenna (540), defeated the Persians (541-542), rescued Constantinople from the Bulgars (549). His victories aroused the jealousy of Justinian and Belisarius was imprisoned for a time, though the story that in old age he was obliged to beg his bread is false. Freeman declared him the greatest of military commanders in history, with Hannibal as his only rival. Belisarius was thoughtful of others in his hour of triumph for his name is connected with the foundation of a hospital at Rome about the middle of this century. Pope Symmachus had set the fashion for such foundations by establishing a hospital in connection with the three most important churches of Rome, Saint Peter's, Saint Paul's and Saint Lawrence's; as all three were situated well out of the city proper they presented ideal locations for hospitals. The example thus set was followed in many cities in France and in various places in England, after Saint Augustine's missionary work began to have its effect.

Even more than as a great ruler Justinian is forever famous as the promulgator of the code of law since usually called by his name. The 'Corpus Juris Civilis' (Body of the civil law of Rome) published by him comprised all the law knowledge of the ancient Romans and as we realize now was the most precious legacy of Rome to the world. Justinian deserves because of it the title of "law giver of civilization."

Justinian's worthy monument and a striking symbol of the creative artistry of the time is the church of Santa Sophia in Constantinople, still standing as unimpeachable evidence of constructive genius and love of the beautiful. The

church is almost a square (250 by 230 feet), above which there is an enormous dome over 100 feet in diameter. This central dome represents the solution of an architectural problem of the greatest difficulty. The church was completed under Justinian (537) and Procopius a contemporary declared that the dome had the appearance of being suspended in the air "by a golden chain from heaven rather than of resting upon solid masonry." The interior decoration was in richly carved colored marbles, while mosaics covered the wall space left free and adorned the vaulting above. The pavement composed of jasper, alabaster, porphyry and serpentine formed a veritable carpet of many colors. The effect according to a contemporary was that of "a garden, its lawns enameled with flowers" . . . "The altar was a marvel in itself. The mensa was entirely of gold, sparkling with jewels and glowing with enamels. It rested on columns also made of gold, while over it, four columns of silver supported a domed canopy surmounted by a great golden cross. Around the altar hung curtains of wonderful tapestry of silk and gold wherein were depicted Justinian and Theodora venerating Christ and His Mother. At the end of the apse, rose up the patriarchal throne of silver and gold."

The architect of Santa Sophia was Anthemios of Tralles, sometimes said to have been brother of Alexander of Tralles, the author of a well-known treatise on the pathology and therapeutics of internal diseases which was evidently a compilation of material gathered for teaching purposes. It is one of the landmarks of medical history. Alexander says "The physician should be an inventor and think out new ways and means by which the cure of the patient's affection and the relief of his symptoms may be brought about." He took strong ground against the use of many drugs and the rage for operating. The prevention of disease is for him the important part of the physician's duty. Diet, air and water were his great remedies; for consumption he recommended milk, strong nutritious diet and a sea voyage or a stay at a watering place.

Pope Saint Gregory I the Great (540-604) is one of the important characters in this trying time around whom the forces of the new life that was to come for Europe gathered. Among his close friends were Saint Augustine whom he sent on a mission to England, though the story of the English boy captives in Rome, "*Angeli non Angli*"—Angles who looked more like angels—is dubious; and Saint Benedict and his sister, Saint Scholastica, who were destined to a very great work, the influence of which was to be felt for many centuries, even down to our own time. Gregory had been in the Roman civil service as *prætor urbanus*, but turned to the ecclesiastical state and employed the fortune left him at his father's death to establish a series of monasteries. As Pope (590-604) he restored discipline among the monks and clergy, arranged the Gregorian chant in church music which is still used and was zealous in the spread of Christianity. He wanted to go as a missionary to Britain in earlier life, but was prevented by the Pope who foresaw his higher destiny; later he inspired Augustine with his own zeal. He and Pope Leo I (circa 460) are the great popes

of the transition from ancient to mediæval Church. Gregory's friend Benedict, known as Nursia from the place of his birth, is the founder of monasticism in the West. He was the son of a Roman noble whose boyhood was spent in Rome where he attended school until he reached the higher studies. At the age of 20, about the year 500, disgusted with the loose life around him, he withdrew from Rome to find a place of peace and recollection. At first he took a servant with him, but he found after a while, that he needed manual labor to keep him in good health. Attracted by his gentleness and by the refuge from the madding crowd around them which his little retreat offered, many others came to join him, until Benedict found that his own peace of mind and heart was sacrificed, so that he fled further to live alone. He learned enough in three years of solitude to make him appreciate how much this retired mode of life might mean to others, for their personal development, and so (when the fame of his gentle saintliness having gone abroad) he was asked to be the head of a monastery, he consented. Here he drew up his famous Rule, which has served as the constitution of the Benedictine houses ever since, and which authorities in the history of law hail as a great foundation-stone of modern jurisprudence. His monasteries were arranged to provide opportunities for prayer, recollection, study, besides such labor as would keep the body in good condition. Men of all classes, even of the nobility and of reigning families, joined his communities and gave the example of laboring with their own hands. They restored the dignity of manual labor which had been undermined by the slave labor which had absorbed all manual work at the end of the Roman Empire. The monks gave themselves assiduously to the copying of manuscripts of the ancient authors and the exchange of these copies led to the formation of a number of monastic libraries through which the classics have been preserved for us. Each monastery had a school attached to it where the boys of the neighborhood and sometimes even from a distance were taught; and sons of the nobility often spent some years in these monastic schools. The solution of the social problems of the country places became the special task of the monasteries.

They were, besides, centres around which there gathered a numerous tenantry who worked the lands of the monasteries, which were mainly gifts and bequests from kings and nobles who realized how much good was being accomplished by the monks, and who hoped thus to make up for evil in their own lives by foundations which would continue to do good. Monasteries, quite contrary to the tradition of "lazy monks," of a generation ago, were really hives of busy industry. It is only since we have established agricultural schools that the realization has come that the old monasteries represent an anticipation of these schools (Goodell Presidential Address Massachusetts Agricultural School). For the tenantry were taught how to raise their crops to the best advantage; good breeds of stock and seeds which would grow to the best advantage under the conditions were provided for them. The monastery itself diked, ditched and drained the territory, often brought water

from a distance for irrigation. It was no wonder that the tradition arose that it was "happy to live under the crozier," that is under the rule of an abbot or abbess, for the convents for women shared all of the privileges and advantages of the monasteries for men. These monasteries became centres of trade and industry as well as of education and of letters. They cultivated particularly architecture and the arts of painting and sculpture, but also the minor arts and crafts, so that beautiful wood work and iron work, as well as carving in stone and stained glassmaking, were developed to a high degree, while the convents accomplished similar artistic purposes in lace-making, needle-work, tapestry, book illumination and like occupations.

The Benedictine nuns were founded by the twin sister of Benedict, Scholastica by name, and the nunneries came to be refuges for women who wished to pursue an intellectual and spiritual life, similar to that which the monasteries provided for the men. At all times in history, a certain number of women do not feel the vocation to be wives and mothers and to assume family cares. Some provision must be made for them and the failure of such provision brings serious social evils in its train. For centuries these Benedictine nunneries provided an opportunity for these women and besides accomplished wonderful work. Mrs. Putnam (dean of Barnard College) goes so far as to say that the modern college for women has not as yet provided opportunities for the exertion of woman's influence equal to those given her by the Benedictine nunneries in the Middle Ages. We know almost nothing of the life of Saint Scholastica, except the famous story told by no less an authority than Pope Saint Gregory I, that when she came to die and her brother, who was with her, was about to leave, in order to keep his own rule that no one unless compelled should stay out of his monastery over night, Saint Scholastica prayed that he might be kept near her, and a great storm arose which prevented Benedictine from leaving her side until after her passing. Her convents, like the monasteries of Saint Benedictine, are still in existence all over the world, many of them very flourishing and all engaged in good work. The word "nun," originally *nonna* or *nanna*, was a form of the word "mother," because these women who denied themselves personal maternity became the mothers of the needy all around them.

As the result of the large number of slaves which had accumulated in Roman times, the Middle Ages began with the very serious handicap of an immense problem of serfdom. During the first century of the Christian era, when Rome had a population of about 2,000,000, it has been calculated that about 1,200,000 of them were slaves. This state of affairs grew worse with time. The condition was not so bad in country places, but opportunities for becoming freemen were much commoner in urban than in rural life, though everywhere progressive individuals were able to secure their freedom in one way or another. The defeats of the barbarous peoples in preceding centuries led to the capture of many prisoners who were made slaves, and these were distributed throughout the country places and their descendants were serfs. By this was meant that they were

bound to a condition of service, though their masters were bound also in certain obligations toward them. These serfs went with the land whenever it was transferred, and as the land was divided into manors or villas (Latin for a country estate), they were called villains. This word afterward became villain in our sense of rascal, because serfs who ran away from their masters so often found themselves under the necessity of making their living as best they might, by their wits or even by violence.

The serf belonged to the land but the land owed him a living. In a certain sense, therefore, he was better off than the lowest classes have been since the industrial revolution. While some masters were harsh, a great many of them tried to make conditions reasonable for the workers, and persons of special talent and energy who were able to make their own way could usually obtain their freedom. If a serf were absent from his master's domain for a year and a day, the master had no further claim on him. The brighter boys from the country went into the towns, rose from apprentices to membership in the guilds and thus secured their rights as freemen. At this time, no one was supposed to have any rights unless they had been specifically conveyed to him by some authority. This condition of villainage continued for centuries, the conditions of it being gradually ameliorated. Villas or manors were transferred by bequest or gift to monasteries or convents and the serfs on these were treated so well that it came to be a tradition that it was good to live on the domains of abbot or abbess. Their children sometimes entered the convents and monasteries and were given the opportunity to rise. Some of them became priors or abbots and sometimes bishops, and occasionally the descendant of a serf might be made Lord Chancellor of the kingdom. The presence of all these serfs or slaves to whom the hard manual labor of the time was entrusted made the doing of manual labor by others seem disgraceful, and it was not until the foundation of the monks of the West with the provision of the Benedictine Rule for manual labor by all, that the dignity of labor was restored. It took centuries of Christian effort to bring about a definite improvement in social conditions in this regard.

While Benedict's foundation was gathering strength the 6th century is full of the labors of the Irish monks. Zimmer declared "The Irish missionaries were instructors in every known branch of science of the time, the pioneers who laid the corner stone of Western culture on the continent." The greatest of them is Columba of Iona (521-597). Scarcely less great is Columbanus of Bobbio, though the work for which he is best known was done in the next century. Columba left Ireland in his 44th year, landing at Iona on the eve of Pentecost 563. From here he began the conversion of the Northern Picts. He wandered far and wide on foot through the land and is said never to have spent an hour without study, prayer, writing or some similar occupation. He himself transcribed many books. In spite of incessant labors, fasting and vigils, sleeping his scanty sleep often on a stone pillow, like so many other of the intensely hard workers of human history, Columba lived to the round old age of nearly

80. He was not only a great missionary saint who won a whole kingdom to Christ, but he was "a statesman, a scholar, a poet, the founder of numerous churches and monasteries when monasteries corresponded to our colleges, and his name is dear to Scotsmen and Irishmen alike." To him we owe a famous decision as to books that the owner of an original had the right over the copies, for "to every cow its calf," which represents the basis of copyright.

The end of the century witnessed the installation of Saint Augustine (Austin) as archbishop of Canterbury (598). He was a Roman who became a monk and a personal friend of Pope Gregory the Great. In his desire to carry out a great missionary project among the Angles, or English,—the Britons had Christianity before this,—Gregory sent Augustine to England and gave him jurisdiction over all the bishops on the island. His mission was eminently successful. Aethelbert the king, who had married the daughter of Charibert of Paris with the condition that she should be allowed to exercise her Christian religion freely, was converted and his people soon followed him. Quite contrary to the spirit sometimes displayed, Bede tells us that it was part of the king's policy "to compel no man to embrace Christianity." On Christmas Day 597 more than 10,000 persons were baptized by the first archbishop of the English. England was thus placed once more in touch with Roman culture. "The civilization, art, letters, which had fled before the sword of the English conquerors returned with the Christian faith." (Green).

When Augustine landed he brought with him Roman customs and as certain traditions had grown up in the British and Celtic churches not in accord with those of Rome, particularly as to the date of Easter and the form of tonsure, jealous rivalry ensued and it seemed for a time as though there might be actual division. A synod was called at Whitby (7th century) and through the influence of the king the dispute was brought to an end and England was won to the Roman side.

The characters of the men among whom Columba and Augustine had to do their missionary work is well illustrated in the poem known as 'Beowulf,' the first English epic which was written probably some time toward the end of this century. Beowulf was a kinsman of Hygelac who appears in Gregory of Tours' *Gesta Regum Francorum*. He lived in the early part of this century and the myths that gathered around Beowulf's name were probably put into nearly the form in which we now have them in immediately succeeding generations and represent our earliest Old English literature. The epic is pagan and barbaric, full of the lust of blood, and yet it has a stirring appeal to deep human interests that accounts for its survival. The prose writers of this first century of the Middle Ages whose works have come down to us are more numerous than might be thought. Procopius, a Roman historian, is often spoken of as the last of the classic writers. The end of the century saw such well-known historians as Gregory of Tours, the father of French history, Gildas the first British historian, Evagrius ecclesiastical

historian, and Cassiodorus of Ravenna, the minister of Theodoric.

JAMES J. WALSH,

Author of 'The Thirteenth Greatest of Centuries.'

PRINCIPAL EVENTS OF THE SIXTH CENTURY.

510. Clovis, king of the Franks, makes Paris his capital.
520. Hygelac, the Danish hero of the "Beowulf" epic, killed by Franks in a naval battle.
524. Boethius, author of the "Consolations of Philosophy," put to death by Theodoric.
525. An earthquake destroys Antioch.
526. Death of Theodoric, king of the Ostrogoths.
527. The Justinian Code published.
529. Belisarius defeats the Persians.
532. Belisarius overthrows the "Green" party at Constantinople.
534. Belisarius defeats the African Vandals.
535. Belisarius conquers Sicily.
536. Belisarius captures Rome and occupies southern Italy.
537. The church of Saint Sophia at Constantinople completed.
- 541-542. Belisarius defeats the Persians.
548. Justinian invites the German Longobards or Lombards to Italy to aid him against the Ostrogoths.
549. Belisarius rescues Constantinople from the Bulgars.
550. Huns and Slavs invade Italy.
551. The silkworm introduced into Europe.
554. Greek domination supreme throughout Italy.
556. Earthquake devastates Constantinople.
563. Columba leaves Ireland and lands at Iona.
565. Justinian the Great dies.
565. Procopius, the Roman historian, dies.
568. Lombards occupy northern Italy, and Greek rule is confined to southern Italy.
570. Birth of Mohammed.
570. Gildes, the first British historian, dies.
572. War between the Byzantines and Persians.
583. Cassiodorus of Ravenna, the former minister of Theodoric, dies.
590. Gregory the Great became Pope.
594. Gregory of Tours, the father of French history, dies.
597. Columba of Iona dies. On Christmas Day 10,000 persons were baptized by Saint Augustine.
598. Saint Augustine becomes archbishop of Canterbury.
599. Pope Gregory the Great institutes Church reform.
600. Evagrius, ecclesiastical historian, dies.

SIXTUS, siks'tūs, the name of five popes, as follows:

SIXTUS I, Saint (also written Xystus). He succeeded Alexander I, about 119, and suffered martyrdom about 127, after 10 years rule.

SIXTUS II, Saint: d. 258. He succeeded Stephen I in 257, and according to some accounts was an Athenian philosopher before professing Christianity. He was martyred during the persecution of the Christians by Valerian, and is the Xystus commemorated in the Canon of the Mass.

SIXTUS III, Saint: d. 440. He succeeded Celestine I in 432. He was active in attempting to reconcile the disputes existing in the Eastern Church, particularly in the case of Cyril, bishop of Alexandria, and John of Antioch. Several letters by him with regard to those controversies are extant. He was a munificent patron of learning, and is stated to have left a large sum to be expended in the adornment of ecclesiastical structures.

SIXTUS IV (FRANCESCO DELLA ROVERE, frān-chēs'kō dell'lä rō-vā'rā): b. Savona, 21 July 1414; d. 12 Aug. 1484. He was the son of a Genoese fisherman, and entered the Franciscan order, where his learning and eloquence soon attracted attention. His abilities secured him the chair of divinity at Padua and other Italian universities, and he also became general of his order. He was made cardinal by Paul II, whom he succeeded in 1471 through the influence, it was supposed, of Cardinal Bessarion, whose close friend he was. He was an en-

lightened patron of art and during his occupancy of the papal chair the Sistine Bridge was erected and the famous Sistine Chapel. Many of his relatives were advanced to high places of profit by him, and for this and certain acts of treachery he was much criticised, but R. Urban Butler states, in 'The Catholic Encyclopedia,' "the gross accusations brought against him by his enemy Infessura have no foundation." He reformed the papal coinage and did much to improve and beautify Rome.

SIXTUS V (FELIX PERETTI, fä'lēks pä-ret'tē): b. near Montalto, 13 Dec. 1521; d. Rome, 27 Aug. 1590. His boyhood was spent as a swineherd; but, giving early indications of an aspiring disposition, he was admitted to the Franciscan order in 1534, and received the usual strict education and instruction of the monasteries. In 1544 he gave instruction in the canon law at Rimini, and in 1546 at Siena. In 1548 he was made priest, doctor of divinity and superintendent of the monastic school of Siena. In 1556 he removed to Venice, where he was appointed superintendent of the Franciscan school, and afterward inquisitor-general. In 1560 he was recalled from Venice, owing to his severity as inquisitor, and proceeded to Rome, where the Pope conferred upon him several dignities. Some years later (1565) he attended the papal legate to Spain as the theologian of the embassy, and while here acquainted himself with the policy of the Spanish court. In 1570 he was made cardinal by Pius V. He was elected to the papal see in 1585, and during his five years' administration devoted himself with great vigor to the reform of abuses both civil and ecclesiastical. Under his immediate predecessors, Pius V and Gregory XIII, the civil disorder was excessive in the states of the Church, crimes had gone unpunished and hordes of brigands infested the whole country. All this was now remedied, stern justice was administered on all hands, the country cleared of robbers and under the security thus produced agriculture, commerce and industry flourished anew. Sixtus founded a new university at Fermo, and new colleges at Rome and Bologna; and embellished Rome with numerous and useful structures, among others the present building of the Vatican Library. He published a new edition of the 'Septuagint' in 1587, and one of the 'Vulgate,' with improvements, in 1590, besides corrected editions of the Church Fathers. He displayed the same energy in the spiritual administration of the Church, re-established discipline in the religious orders and founded or reformed several congregations of cardinals and other officers. He fixed the number of cardinals at 70. He took a part in most of the great events that then agitated Europe. He encouraged and supported Henry III against the Huguenots, Philip II against England, and Archduke Maximilian when he was a candidate for the Polish crown. The great aim of his foreign policy was the promotion of the cause of Roman Catholicism throughout all Christendom against Protestantism.

SIZAR, a term used in the University of Cambridge, and at Trinity College, Dublin, to denote a class of students of limited means who usually receive their commons free and are peculiarly assisted otherwise. They were origi-

nally required to perform certain duties of a menial character, but this practice has long ago fallen into desuetude. Formerly there was a similar class of students at Oxford called servitors of battelers.

SIZE, a gelatinous material used to give a glaze to a surface. There are numerous formulas for its manufacture, differing according to the purpose, cost of ingredients, etc. Gilders use a viscous preparation as a size to hold the gold leaf; an albuminous printing ink is made to hold bronze powders; house-painters' size may be prepared from shreds of leather boiled and strained; papermakers use two kinds, one made from hide cuttings, alum and soap, and a second of rosin and potash; and the size employed in gilding, japanning, etc., is variously composed of linseed oil, copal, red leather, litharge, vermilion, etc., with turpentine.

SJÖSTEDT, shēs'tēt, Ernest Adolf, Canadian mining and metallurgical engineer and inventor: b. Sweden, 1840. He was graduated at the Royal School of Mines, Stockholm, in 1876, and came to the United States in 1877. He was assistant chemist at the Bethlehem Steel Works, Pennsylvania, in 1877-79, and in 1879-96 he was connected with the iron-smelting industry in Maine, Georgia and Nova Scotia. In 1896 he established himself at Montreal as a designer of roasting furnaces and gas producers; and in 1898 he became chief metallurgist of the Lake Superior Power Company at Sault Sainte Marie. He invented the Davis-Colby iron-ore roaster; the Sjöstedt sulphide roaster; the Sjöstedt electric smelting furnaces, and the Sjöstedt-James electrolytic process for the separation of copper and nickel.

SKAGEN (skä'gēn) **CAPE**, or **THE SKAW**, skā, Denmark, the extreme northern point of Jutland. It is a low sand bar or narrow tongue of land and near its extremity is an important lighthouse.

SKAGER RACK, skäg-ēr-rāk, or **SKAGERRAK**, the broad channel connecting the North Sea with the Kattegat, and separating Norway from Jutland. It is about 150 miles long and 100 to 125 miles wide. Its southern part is shallow and beset with sand-banks, but it is very deep along the Norwegian coast. Its navigation is dangerous on account of frequent and violent storms.

SKAGWAY, skäg'wā, or **SKAGUAY**, Alaska, city at the northern end of Chilkat inlet, at the head of Lynn Canal. It is at the entrance to White Pass and near Chilkoot Pass, about 270 miles north of Sitka. It is on the White Pass and Yukon Railroad, which with other railroads and with water routes makes a continuous rail and water route from Skagway to Seward Peninsula. There were trading stations in the vicinity, and it may be on the site of the present city, but they were established and abandoned to suit the needs of the traders. The settlement of the present city began in 1897 when a miner from Minneapolis, Minn., opened a wagon road across White Pass from the Canadian gold fields. From a town of tent-cloth dwellings it has become a prosperous little city, with manufactories and stores to meet the demands of a large number of the mining camps of the interior. In 1899 a college was established with Dr. La Motte Gordon,

an Oxford graduate, as president, and with 50 pupils in attendance. There are public schools and Presbyterian, Roman Catholic, Protestant Episcopal and Methodist churches. Pop. about 3,500.

SKALD, skāld or sköld (in Old Norse Skāld, poet), one of the Norse poets who in primitive times recited long compositions in verse, usually in honor of the great and famous. They were minstrels of a high order, often attached to the court. The earliest of these skalds was the mythical Starkadh the Old. The following are the most famous of his successors: Thjodolf, author of 'Ynglinga-tal'; and Thorbjorn the minstrel and author of 'Haralds-mal,' both of whom flourished at the end of the 9th century at the court of Harold of the Bright Hair. In the 10th century lived the Norwegian skald Eyvind who sang the exploits of the famous 'Hakonar-mal'; and the Icelander Egil, who gave his name to the Egils-Saga. More obscure were Hallfredh, Gunlaug, Glum, Eyjolf, etc. The last of the skalds was Skurla who died 1284. Consult Grendal, 'Clavis Poetica' (1864); Baldisarson, 'Íslendingadrapa' (edited by Möbius, 1874); Wisen, 'Carmina Norroena' (1889); Anderson, 'Norse Mythology' (1875).

SKARPANTO, skärpän-tō, or **SCARPANTO**. See CARPATHOS.

SKAT, an intricate game of cards originating in Germany about the year 1800. Thirty-two cards are used and three or four persons take part in the game, although but three are active players. The interest is maintained largely by bidding for the privilege of play. Each player holds 10 cards, two being laid aside for the "skat." The use of these two cards determines the game. For a complete description of the game consult Hoffman, 'Book of Skat'; Eichhorn, 'American Skat.'

SKATE. See RAY.

SKATES AND SKATING. Ice skates are made in many forms, the most common having a metal blade or runner, longer than the foot, with some sort of frame or mechanism for attaching to the shoe. The object is to provide a support on which each foot of the wearer can slide or glide on the ice, this method being by far the most rapid means of travel over a frozen surface by the individual's own exertions. Skating is undoubtedly of great antiquity; as shown by early carvings. It is mentioned in the Icelandic 'Edda,' supposed to have been written in the 10th or 11th century. Primitive skates were made by tying smooth bones of animals to the foot-coverings. The earlier forms were mainly of wood, with a metal runner. This runner was gradually improved until it became a blade of hard steel with a slightly up-curved front. The wooden-bodied skates of the 19th century were universally tied on to the foot with leather straps, passing through slots in the wood. As they were improved a sharp point was placed in the rear of the skate to cut into the shoe-heel and prevent slipping; later a screw took the place of the point. Then came the club-skate, all metal, with clamps for gripping the sole of the shoe and a gripping mechanism to engage a steel plate permanently fastened on the heel of the shoe. Fancy skates were made with long ornamental up-curve of the runner in front. The racers developed a different type with a

long runner, almost straight, though slightly raised above the level in front. This was found so superior that it was adopted by all speed skaters and many amateurs. Finally came the skating boot, a well-made strong boot, with the runner directly attached to the sole. This has been generally adopted by figure skaters and racers.

Skating was developed in the cold countries of the north, both as a pastime and as means of getting about rapidly. In the Netherlands the canals made convenient highways in winter, and have been used by skaters for hundreds of years. The earliest record of a skating club is in Edinburgh, Scotland, in 1642. The British National Skating Association was formed in 1879. The American National Skating Association was organized in the United States in 1884, and the Canadian Amateur Association in 1886. There are now also the Eastern Amateur Skating Association, the International Skating Club of America and the International Skating Union of America. Matches were held, however, long before the time of these associations. The first recorded English match was in 1823. Newburgh, N. Y., furnished the first American champion skater, Charles June, who was the recognized speed champion for many years. In those days the skaters used a short runner and took long strokes of 10 to 12 yards. All this was changed by the Donohues of Newburgh, regarded as the greatest family of skaters in the world, having produced three champions. T. Donohue, the elder, first beat all comers and educated his sons to the sport, and J. F. Donohue and T. Donohue, Jr., in turn took world's records. They developed the long runner skate and the short stroke, and J. F. Donohue attended the international meet at Amsterdam in 1891, and astonished them by his short quick strokes of six or seven yards, easily beating all contestants.

Figure skating, by some called fancy skating, appears to have had its first great impetus in the London Skating Club founded in 1830. Becoming favorably known as a sport, other clubs were organized in Switzerland and northern Europe, and figure skating became a popular sport of the well-to-do. In this branch of skating there is no attempt at speed, the object being first to skim around in loops, cross-cuts, grapevines, two-footed figures and various combined figures in which one of more pairs of skaters take part. It might be called the equivalent of dancing on ice, graceful exercise being the end sought. The British style of figure demands an upright body, and is considered more graceful than the bending over style, though the latter permits some accomplishments not readily done erect. The plain figures are formed on one skate, the unemployed leg being trailed behind, either straight or slightly bent and used to steer and balance.

Records.—Championship matches have become common in all of the northern cold countries. Both indoor and outdoor tournaments have been held in the United States and Canada for many years. Popular tournament places have been Montreal and Toronto, in Canada, and Minneapolis, Milwaukee, Stamford, Conn., Red Bank, N. J., and Saranac Lake and Newburgh, N. Y., in the United States. The amateur records have often surpassed the professional

records for shorter distances, probably due to the fact that there are few professional racers. The amateur American records are: 100 yards, Morris Wood, 9 3-5 seconds, in 1903; 220 yards, Fred J. Robson, 18 seconds, 1911; half mile, Ben O'Sicky, 1 minute, 15 3-5 seconds, 1916; one mile, Morris Wood, 2 minutes, 41 1-5 seconds, 1904; five miles, E. Lamy, 14 minutes, 55 seconds, 1910. The world's amateur records are in metres, and from 500 to 10,000 metres, were all taken by O. Mathiesen, of Norway, at various public meets in Europe, between 1910 and 1914, with the following results: 500 metres, 43 7-10 seconds; 1,000 metres, 1 minute, 31 4-5 seconds; 1,500 metres, 2 minutes, 19 1-2 seconds; 5,000 metres, 8 minutes, 36 3-5 seconds; 10,000 metres, 17 minutes, 22 6-10 seconds. The professional American records are: 100 yards, John S. Johnson, 9 4-5 seconds, 1893; 200 yards, John S. Johnson, 17 2-5 seconds, 1893; 440 yards, John S. Johnson, 31 3-4 seconds, 1916; half mile, John Nilsson, 1 minute, 16 1-5 seconds, 1897; one mile, Arthur Staff, 2 minutes, 35 seconds, 1916; two miles, John Nilsson, 5 minutes, 33 4-5 seconds, 1900; five miles, O. Rudd, 14 minutes, 24 seconds, 1896; 10 miles, John S. Johnson, 31 minutes, 16 1-2 seconds, 1894; 20 miles, John S. Johnson, 1 hour, 6 minutes, 36 2-5 seconds, 1894; 25 miles, John Karlson, 1 hour, 30 minutes, 15 seconds, 1916. All records from 30 miles to 100 miles are held by J. F. Donohue, who at Stamford, Conn., in 1893, made the 100 miles in 7 hours, 11 minutes, 38 1-5 seconds. Consult Browne, G. H., 'Handbook of Figure Skating' (Springfield, Mass., 1913); Meagher, G. A., 'Lessons in Skating' (1900). See ROLLER SKATE

SKEAT, skēt, Walter William, English scholar and philologist: b. London, 21 Nov. 1835; d. 7 Oct. 1912. He was graduated from Christ College, Cambridge, in 1858, and two years later became a Fellow of his college and curate of East Dereham, in Norfolk. In 1862 he went to Godalming, in Surrey, as curate. He was appointed a mathematical lecturer of Christ's College in 1864 and since 1878 held the Erlington and Bosworth professorship of Anglo-Saxon in the university. Skeat's work in the philology of the English language, especially in its older forms, is of the utmost value and has contributed much to stimulate interest in such studies. His chief original publications in this department are 'A Mæso-Gothic Glossary' (1868); 'Etymological Dictionary of the English Language' (1879-84; revised 1910), his most important work; 'Concise Etymological Dictionary of the English Language' (1882; new ed., rewritten and rearranged, 1901); 'Principles of English Etymology' (two series, 1887 and 1891); 'Primer of English Etymology' (1892), smaller work based upon the preceding, but dealing only with the native element; 'The Chaucer Canon, with a Discussion of the Works associated with the name of Geoffrey Chaucer' (1900); 'Place Names of Cambridgeshire' (1901); and 'Notes on English Etymology' (1901). Among numerous editions of English texts which he has edited for various societies and publishers may be cited 'Lancelot of the Laik' (1865); 'Havelok the Dane' (1868); 'The Vision of William concerning Piers the Plowman' (1886), giving the three texts parallel, with notes, glossary, etc.;

'Æfric's Lives of Saints' (1882-98); Chatterton's 'Poems' (1871); 'The Works of Chaucer' (with notes, glossary, etc., 1894-95; with a supplemental volume of spurious Chaucerian pieces, 1897); and 'The Student's Chaucer' (1895). He founded the English Dialect Society in 1873, and was its chief member during the 23 years of its existence. For it he prepared several provincial glossaries and upon these and other publications of the society the new 'Dialect Dictionary' is based. 'A Student's Pastime' (1896) consists of articles contributed by him to 'Notes and Queries.' He has also translated Uhland's 'Songs and Ballads' (1864).

SKEE. See SKI.

SKEED. See SKID.

SKELETON, the more or less hard structures, mainly of bony nature, which form the internal axis of support of the soft parts in the higher or vertebrate animals. The term is used in comparative anatomy to designate supporting parts not only of internal, but also of external nature. Anatomists thus speak of an endoskeleton as proper to the vertebrates, but both vertebrates and invertebrates may have certain hard parts developed on the exterior of their bodies (for example, shell of lobster, scales of fishes, etc.), and to the latter class of structures is applied the name exoskeleton. The parts of any endoskeleton may generally be grouped under the two heads of the spinal or axial skeleton and the appendicular parts. The former includes the skeleton of the head and trunk, the latter that of the limbs. The spinal skeleton involves the consideration of the skull (q.v.), spinal or vertebral column, composed of its various vertebræ and of the thorax (q.v.) or chest and pelvis (q.v.). The composition of the skull forms a subject of great intricacy and involves many highly technical considerations. The more general characters of the skull are noted in a separate article (see SKULL). The vertebræ or component parts of the spine or backbone consist each of a solid piece or body, attached to which are various processes. The spinal arches spring from the posterior part of each vertebra and unite to form the spinous process; the spinal cord itself being protected within the canal formed by the apposition of the arches of the vertebræ. In man seven cervical or neck vertebræ, 12 dorsal and five lumbar vertebræ exist as separate bones. The sacrum (q.v.) and coccyx, forming the terminal part of man's spine, are composed of united vertebræ. Thirty-three vertebræ are found in the human foetus normally, but in the adult five of these unite to form the sacrum; while the other four (more or less) form a short tail piece or coccyx, the latter being below the junction with the pelvis. The heavy pelvic bone in man makes a base for the spine and head sockets for the femurs or leg-bones. The ribs in man correspond in number with the dorsal vertebræ. The limbs consist of homologous or corresponding parts and are attached to a series of bones constituting the "arch" or support of the fore and hind limbs respectively. The scapulæ or shoulder-blades and collar-bones or clavicles constitute the shoulder-girdle (see SHOULDER-JOINT), or arch supporting the fore or upper limb, while

the lower limb is attached to the pelvic arch or pelvis. The upper limb or arm in man contains 31 bones; the humerus or bone of the upper arm; the radius and ulna, or bones of the forearm; the carpal or wrist bones; the metacarpal bones, or those of the palm; and the phalanges, or bones of the fingers. The lower limb or leg in man contains 30 bones: the femur or thigh-bone; the tibia (shin) and fibula or bones of the leg; the tarsal bones or those of the ankle, corresponding to those of the wrist; the metatarsus or instep; and the phalanges or bones of the toes. (See the illustration of the human skeleton under anatomy, Vol. I). The character and appearance of the bones changes materially with advancing years. The bones of a child at birth are soft and incomplete. They grow, ossify and fuse together in a most interesting manner, so that the dissector can judge approximately of the age of an individual by the condition of the bones.

Invertebrates.—Shell fish have exoskeletons or shells composed mainly of lime or flint, which is absorbed and utilized. The corals (q.v.) produce a formation that is their skeleton. The arthropods or snails have a horny little house or exoskeleton, the cuticle forming from the epidermis with an organic base of chitin on which carbonate of lime is deposited. In the lobster, scorpion and many crabs, the skeleton is partly interior. Most mollusks leave shells in which the carbonate of lime occurs along with an organic base of conchiolin; in the cuttlefish there is a pronounced development of cartilage about the nerve centres of the head, suggesting a basis for a skull.

Vertebrates.—In a primitive vertebrate, as the lancelet (*Branchiostoma lanceolatum*), the body is supported by a median dorsal axis; and, disregarding slight bony supports for the mouth, the pharynx and the median fin, that is the active skeleton or framework. The median dorsal axis, which in the lancelet has not even the solidity of cartilage, is the notochord, a constant characteristic of all skeletons of vertebrates. This notochord may be likened to an elastic rod that in the embryo is formed under the neural canal, consisting of a longitudinal axis for separating the dorsal nervous tube from the ventral alimentary passage. This notochord in the lancelet, the hog and the young lamprey is an unsegmented rod with a simple sheath. In the adult lamprey there form above the notochord, rudimentary arches of cartilage that maintain the spinal cord. Cartilaginous arches appear both above and below the notochord in the sturgeon, the chimera and the dipnoi, but there are no true vertebræ. These are noted first in the elasmobranch fishes, in which the notochord is more or less constricted by the encroachment of its sheath, and divided into vertebræ. In the bony ganoid fishes, the vertebræ are ossified, as in higher vertebrates. The notochord, therefore, appears a provisional structure or scaffolding around which a backbone can be built. Each vertebræ usually consists of the centrum or substantial body, the neural arches that form a tube for the spinal cord and meet above in a neural spine, the transverse processes which project and are commonly connected with ribs and the articular processes which bind the vertebræ together into a strong but flexible backbone. Birds and mammals and many reptiles have a

breast bone or sternum, to which the ribs unite ventrally.

The pectoral or shoulder-girdle consists of a dorsal shoulder-blade or scapula, a ventral coracoid with the articulation for the arm or fore-leg between them and of a forward growing collar-bone or clavicle. The pelvic or hip girdle in each side consists of a dorsal ilium, a ventral ischium with the articulation of the leg between them, and of a pubic portion. From amphibians upward, the forelimb is a humerus articulating with the girdle, a lower arm composed of radius and ulna side by side, a wrist or carpus of several elements, a hand with metacarpal bones in the palm, and with fingers composed of several joints or phalanges. The hind limb consists of a femur articulating from the girdle, a lower leg of tibia and fibula side by side, an ankle region or tarsus of several elements, a foot with metatarsal bones in the sole, and with toes of several joints or phalanges. Digits in vertebrates tend to a regular suppression toward the lower types. The pollex goes first, then the minimus index and annularis, so that some animals, as the horse, have one digit (the hoof) remaining. In many of the vertebrates the phalanges are more numerous than in man, as where the hand is modified to form a paddle, notably in the ichthyosauri and the cetacea.

In reptiles the ilium projects rearward, the ischia are often found meeting ventrally, a cartilage or bone projects rearward from the symphysis, supporting the anterior lip of the cloacal orifice, forming a hypoischium. In birds the projection of the ilium is both forward and rearward and it fuses with the vertebral column in the backbone. No union or symphysis is formed by the ischia and pubes in birds, with the exception of the ostrich and rhea. The ilium in mammals projects forward and symphysis of the ischia and pubes is common. In the marsupials and monotremes a portion of the external oblique muscle ossifies to form marsupial bones.

The patella is first noted in the Reptilia, though not common to all. All mammals and birds have this bone excepting a few bats. In the marsupials it commonly remains in the cartilaginous stage. In birds the fibula is often absent or fuses with the tarsal bones, and no ankle joint remains. In the marsupials the enlarged upper end of the fibula may articulate with the femur. Consult any standard work on anatomy; Reynolds, 'The Vertebrate Skeleton' (1897); Dwight, Thomas, 'Clinical Atlas' (Philadelphia 1907); Fraser, J. S. S., 'Anatomy of the Human Skeleton' (1914). See ANATOMY; BONE; OSTEOLOGY; SKULL.

SKELTON, John, English poet: b. apparently in Norfolk, about 1460; d. London, 21 June 1529. He studied at both Oxford and Cambridge, and from both, as well as from the court, he received the laureateship. In 1498 he took holy orders, and subsequently was appointed to the benefice of Diss in Norfolk. In an epistle dedicated to him by Erasmus, that writer declared him to be the *lumen et decus* of British letters. In the pulpit he was remarkable for his buffooneries and according to Anthony à Wood was esteemed "fitter for the stage than for the pew or pulpit." There were three objects at which he delighted to aim

his satire — the mendicant friars, Lily the grammarian and Cardinal Wolsey. His attacks on Wolsey at length aroused the resentment of that prelate and an order being issued for his apprehension, he took refuge in the sanctuary at Westminster, where the abbot afforded him protection until his death, not long before the fall of Wolsey. His works comprise among others the drama or morality of 'Magnificence'; a satire on Wolsey, entitled 'Why come ye not to Courte?'; the 'Tunnyng' (what is the brewing) of Elynoure Rummyng, a humorous picture of low life, and the 'Book of Phylp Sparrow,' an elegy on the sparrow belonging to the "goodly maid" Jane Scroope, which was killed by a cat. The last is the most poetical of his pieces. It is said that his own opinion,

Though my ryme be ragged,
Tatter'd and jagged,
It hath in it some pyth.

is reasonably just. The best edition of his works is by the Rev. Alexander Dyce (1843).

SKENE, skēn, Alexander Johnson Chalmers, American physician and pioneer gynecologist: b. Fyvie, Aberdeen, Scotland, 17 June 1837; d. High Mount, N. Y., 4 July 1900. He came to America in 1856, was graduated at the University of Michigan in 1861 and at the Long Island College Hospital in 1864. He was a surgeon in the United States army in 1863-64, and later was engaged in practice in Brooklyn. He was appointed adjunct professor at the Long Island College Hospital in 1864, professor of gynecology there in 1872 and from 1886 he was dean. He was consultant at many hospitals and dispensaries and was notable among the American pioneers in gynecology. He was author of many treatises and textbooks.

SKENE, William Forbes, Scottish historian and Celtic scholar: b. Inverie, Inverness-shire, 7 June 1809; d. Edinburgh, 29 Aug. 1892. He was educated at Saint Andrews and Edinburgh Universities. In 1832 he became a writer to the *Signet*, and was for some 40 years the head of a prominent legal firm. From an early age he devoted his leisure to archaeological and historical research. His chief works include 'The Highlanders of Scotland, their Origin, History and Antiquities' (1837); 'The Four Ancient Books of Wales' (1868), and 'Celtic Scotland, a History of Ancient Alban' (1876-80). Besides the above he edited 'The Dean of Lismore's Book, with Introduction and Notes' (1861); 'Ancient Gaelic Poetry'; 'Chronicles of the Picts and Scots, and other Early Memorials of Scottish History' (1867); and Fordun's 'Chronicles of the Scottish Nation' (1871). In 1881 he was appointed historiographer royal for Scotland.

SKERRETT, Joseph Salathiel, American naval officer: b. Chillicothe, Ohio, 18 Jan. 1833; d. Washington, D. C., 31 Dec. 1896. He was appointed a midshipman in the navy in 1848 and served with the African squadron engaged in the extermination of the slave trade and was on the *Saratoga* when she captured the *Nightingale*, the last of the American slavers, with 1,000 slaves on board. He was promoted lieutenant-commander in 1862 and as commander of the gunboat *Aroostock* of the Western Gulf

squadron, successfully attacked the Confederate fortifications at the mouth of the Brazos River, Texas. He was made commander in 1867, and in command of the *Portsmouth* in 1873 averted the threatened revolution in Honolulu. While in charge of the *Richmond* of the Asiatic squadron in 1881-84 he settled the trouble in which the United States consul at Samoa had become involved. He was on duty at the Naval Asylum in Philadelphia in 1884-86, commander of the Pacific station in 1892-93 and in 1893 became commander of the Asiatic squadron.

SKERRYVORE, sker-i-vör', Scotland, a dangerous reef lying about 12 miles southwest from the Isle of Tyree on the west coast of Scotland, in the fairway of vessels making for the Clyde and Mersey. The reef was long a danger to navigation until the completion of the celebrated Skerryvore lighthouse in 1844. The tower designed and erected by Alan Stevenson is 137 feet 11 inches in height, 42 feet in diameter at base, decreasing to 16 feet at top. For 26 feet in height the tower is solid. Above the solid the interior is 12 feet in diameter, divided into nine stories, surmounted by a light-room and lantern. Operations were commenced on the rock in 1838 and the light was exhibited in February 1844; it has a range of 18 nautical miles. The apparatus is dioptric revolving, the light attaining its greatest brilliance once in a minute; the machinery which drives the apparatus is also employed to toll fog bells. The total cost of the work was \$434,885.

SKETCH BOOK, The. 'The Sketch Book of Geoffrey Crayon, Gent,' the work by which Washington Irving is best known, was published at New York in seven numbers during 1819 and 1820. The collected edition brought out in 1820 in London contained two earlier essays—'Traits of Indian Character' and 'Philip of Pokanoket'—which have been included in all subsequent editions. The entire collection was revised and given its final form in 1848. 'I have preferred,' Irving later explained, 'adopting the mode of sketches and short tales rather than long works, because I choose to take a line of writing peculiar to myself.' More explicitly, he wrote brief pieces to keep himself from the contagious and overwhelming influence of Scott. In a miscellany like 'The Sketch Book' Irving could, and did, attempt several varieties of manner. 'The Wife,' 'The Broken Heart,' 'The Widow and Her Son,' and 'The Pride of the Village' fell in with a lachrymose tendency of the day and were long popular but have since lost most of their power to move. 'Rural Life in England,' 'The Country Church,' 'Rural Funerals,' and 'The Angler' are based upon actual observation; while not without sentimentalism they have still a pleasant faded charm. The charm has not faded from such essays as 'Westminster Abbey' and 'Stratford-on-Avon,' clear, affectionate pictures of honorable places. But Irving is at his best as essayist when, his eye keenly on the object, he discards sentimentalism and speaks in his natural idiom—humor: this he does in 'The Boar's Head Tavern, Eastcheap,' 'Little Britain,' 'John Bull,' and above all in the dainty series recounting the Christmas ceremonies at Bracebridge Hall. About the whole book there is a delicate flavor of the past which has led some readers to think that

past and present were confused in Irving's mind. The truth, however, is merely that his imagination was highly susceptible to history and tradition, and he was as naturally a maker of legends as a humorist. This is borne out by the tales in 'The Sketch Book': 'The Spectre Bridegroom,' a merry parody, even to its bungling plot, of the horrific narratives then lately brought from Germany; and the masterpieces of the volume, 'Rip Van Winkle' and 'The Legend of Sleepy Hollow.' The central incidents of 'Rip' and the 'Legend' Irving did not invent; one came from a German, one from an American, source. Yet the two stories are as firmly localized in the Hudson Valley as if they had been founded on indigenous folk legends. Both are ascribed to Diedrich Knickerbocker. Both are mellow and rich in style, kindly and chuckling in humor, happy in characterization, and picturesque in description; the plots move with the accomplished ease of perfect leisure, and the landscapes have the golden look of perpetual autumns. Easily the two best short stories in English for the first three decades of the 19th century, they still unquestionably stand, after a hundred years busily given to the development of the short story type, among its undimmed triumphs.

CARL VAN DOREN.

SKETCHLEY, skêch'li, Arthur. See ROSE, GEORGE.

SKI, or **SKEE**, a wooden snow-shoe, or runner of wood, from five to 10 feet long, five inches wide and an inch or more thick at the middle, but thinner toward the ends, and curved up at the front; a ridge or more frequently a slight groove is made longitudinal of the under surface, to resist side slipping. The ski is popularly worn in Norway, Sweden, Lapland, Finland, etc., and has been adopted in other countries for sport. The fastening of the ski to the foot consists of a loop for the toe and a band which passes from this around the heel of the shoe, binding the ski and the foot as firmly as possible, which is necessary in order to steer well, while full freedom is allowed the heel to rise from the ski at every movement. When first putting on the ski, a balancing stick is necessary, and it is indispensable for some time; the most skilful runners need but a small stick. An ordinary ski runner can maintain a speed of eight to nine miles an hour for quite a length of time as his down hill travel is all coasting. The uphill work is zigzag. The longest race on skis, the distance being nearly 140 miles, was run in less than 22 hours, rests included. A race in Christiana won by a peasant in less than 5 hours covered 32 miles, laid over hilly ground including all kinds of difficulties calculated to test the competitors' skill. A Swiss soldier 'skieur' made a record of 25 kilometers in 90 minutes in a rolling country, covering one elevation of 1,550 feet. Leaps of 75 feet are no longer unusual, and more than twice this distance has been recorded. For jumping, a hillside is selected with a large steep slope, and a short rise is built as the place for the leap. As the skiman attains this he stoops and adds his own jumping effort to the force which flings him on into space. He must land on his feet without falling to make a successful jump. The annual tournaments held in the principal cities of Sweden and

Norway are the great sporting events of the year, the great feature of the sport being the ability to take long flying leaps. These proved so popular that the sport spread to other countries, and has been common in the northern United States and Canada. There have been numerous ski tournaments in Montreal and Minnesota; and the number of runners in the United States has increased to an extent that has warranted the organization of a National Association. Consult Rickmers 'Ski-ing' (New York 1909); and Cauldfield, 'How to Ski' (New York 1914).

SKIASCOPE, an apparatus for making observations of the influence of the Röntgen rays on a fluorescent screen. A well-known form consists of a tapering light-tight box, provided at the narrow end with a closely-fitting open cap of black velvet or other soft dark-colored material into which the face will fit closely and exclude light, and at the other end is fixed the fluorescent screen. On looking through the instrument toward an excited Crookes tube placed near it the screen exhibits fluorescence where the Röntgen rays are not interfered with by objects sufficiently dense to obstruct their passage. When objects that are opaque to the Röntgen rays, such as glass, bones and most of the metals, are intervened a shadow of them appears on the screen. Thus if the human hand is placed between the tube and the screen the Röntgen rays will penetrate the flesh but be obstructed by the bones, producing a shadow picture of the bones of the hand.

SKID, one of a pair of logs or beams laid lengthwise as a support in rolling logs, barrels or the like. When a line of parallel logs is thus laid to form a roadway along which logs can be hauled, it is termed a skidway. To move logs on it is "skidding."

SKIDDAW, skid'ā, one of the highest mountains of England, in Cumberland, distinguished for its grand and romantic scenery, as well as for the lakes in its different hollows and near its base; height, 3,054 feet. It is three miles north of Keswick.

SKIFF, Frederick James Volney, museum director and exposition authority: b. Chicopee, Mass., 5 Nov. 1851. He engaged in newspaper work in the West and was manager of the *Denver Tribune*, 1881-85. In 1889 he was appointed commissioner of immigration and statistics for Colorado. Represented Colorado at the Inter-State Expositions of Chicago and Saint Louis, 1889-90. In 1890 President Harrison appointed him one of the national commissioners to the World's Columbian Exposition; subsequently resigned and was appointed chief of the Department of Mines and Mining and later became deputy director-general. At the close of the Chicago Fair he became director of Field Museum of Natural History, Chicago, which position he has since held. He organized the Jury System of the Nashville Exposition of 1897; was director-in-chief for the United States Commission at the Paris Exposition of 1900; was director of exhibits Saint Louis Exposition 1904. President Roosevelt appointed him commissioner-general for the United States to the Japanese Exposition of 1912. In 1911 he accepted position of director-

in-chief of the Panama-Pacific Exposition at San Francisco, 1915.

SKILTON, James A., American lawyer and scientist: d. Brooklyn, N. Y., 4 March 1904. He is best known as the friend of Herbert Spencer, to whom he gave much practical aid, and spent thousands of dollars in the purchase and distribution of Spencer's publications. He was a close friend of Henry Ward Beecher, an active worker in Plymouth Church for 45 years and an able writer on economic conditions and the government of great cities.

SKIMMER, or **SCISSORS-BILL**, an American sea-bird (*Rhynchops nigra*), related to the gulls, and distinguished by the long, thin, knife-like bill. See **SHEARWATER**.

SKIMMIA, a Japanese name for genus of evergreen shrubs, of the *Rutaceæ*, native to India and Japan, with green branches, alternate, entire, coriaceous and pellucidly dotted leaves, crowded at the ends of the branches, and small four- to five-merous flowers, in much-branched white and odorless, terminal panicles. *S. japonica* and *S. fortunei* are dwarfed holly-like shrubs, not entirely hardy in the northern United States, but valuable for planting in warmer countries, especially in cities, as they are among the best smoke-enduring evergreens. They are also valued for winter gardens, and for Christmas decorations, since they are covered with bright red, berry-like fruits, which hang on during the winter, and contrast handsomely with the dark, shining leaves.

SKIMMINGTON (also **SKIMMER-TON**), a word formerly used in England, in the phrase, "To ride skimmington," or "To ride the skimmington," a burlesque procession in ridicule of a man who allowed himself to be henpecked. The man rode behind the woman, with his face to the horse's tail.

SKIN-GRAFTING, the surgical procedure of covering over areas of the body denuded of skin with live skin freshly taken from another part of the patient's body or from another individual. It may be rendered imperative by the great extent of surfaces so denuded, or by disabling or disfiguring contraction. Reverdin's method consists in applying to the raw clean surface small points of superficial epithelium. From these centres a new skin is formed. Thiersch's method consists in covering the raw surface with strips of surface skin of variable length and width. These quickly adhere to the raw surface and if the operation is successful are taken into the epidermis of the patient. In this manner large surfaces as of burns and old sores have been healed over.

SKIN AND SKIN DISEASES. The skin is the group of organs which form the outer covering of the body. It may be regarded as an extensive, complex, uninterrupted membrane, actively functioning, and merging into the mucous membranes at the natural orifices of the body. Beneath it stands in the most intimate structural relationship to the underlying tissues; externally it is exposed to varied and innumerable contacts with the outer world. By reason of this unique position as the boundary of the living organism, the skin has important functions to perform, all of which are contributory to the well-being of the in-

dividual, while some are essential to his continued existence.

To the touch the skin in general is approximately smooth, soft, supple and movable upon the underlying tissues. In certain localities—those subject to special contacts, as the palms and soles—it is more dense and less pliable than elsewhere. Inspection discloses the presence of various surface markings in the form of minute pores and intersecting lines, furrows, and ridges. There is also seen an extensive but variable growth of hair, and at the end of the dorsal portions of the fingers and toes are the horny structures known as the nails. The pores represent the combined openings of the sebaceous glands and the hair-follicles, and as such give exit to the hair-shafts. The lines and furrows of the skin are primarily the product of its elasticity. They are fine, intermediate and coarse. The last type is best seen about the joints, or upon the palms, where by reason of great latitude of movement, the skin is often thrown into folds; the other types occur upon those parts less subject to wide range of motion. The ridges are best observed upon the palms and soles, appearing in curved and straight, more or less parallel formations, said to be characteristic in each individual. Hair is quite generally distributed over the body surface, though certain parts are free; the amount and quality vary greatly with the location. The nails, though unlike the skin in texture and appearance, are entirely derived from the dermal tissues.

Anatomy of the Skin.—Technically in description the term skin includes only the cellular and connective-tissue layers, with their blood-vessels and nerves. The highly differentiated structures which by derivation, function, and position are a part of the skin, as the sebaceous and sweat glands, hairs, hair-follicles, and nails, are termed appendages of the skin. From within outward the skin proper is made up of three layers: the subcutaneous tissue or hypoderm; the corium or true skin, called also the cutis or derma; and the epidermis, cuticle, or scarfskin. The hypoderm can scarcely be considered a distinct layer; it is more properly a connecting bond between the body tissues internally and the corium externally. It is loose in texture, and is composed of interlacing fibrils and bundles of connective tissue, more or less obliquely directed, within the wide meshes of which are deposited masses of fat. This fatty tissue in the hypoderm forms the panniculus adiposus, and to it is due the rounded contour of the well-nourished body. Its disappearance by absorption following prolonged illness, and in old age, produces angularity of feature and wrinkling of the skin. Besides blood-vessels, lymphatics, and nerves, this layer contains sweat-glands, deep hair-follicles, and special nerve-endings. The corium, cutis, or derma, is made up in general of a more or less dense network of fibrous and elastic tissue, carrying within it vessels, nerves, glands, hair, and hair-follicles. It is divided into two layers; the *pars reticularis* and the *pars papillaris*; but the dividing line between the two is not clear-cut. The *pars reticularis* is the layer in contact with the subcutaneous tissue. It is well described by its name—a reticulum of loose connective tissue. The *pars papillaris*

is relatively much thinner, but more dense than the *pars reticularis*, and lies external to the latter. It derives its name from the fact that its outermost portion presents innumerable papilla-like projections, which interdigitate with corresponding downward prolongations from the innermost layer of the epidermis. The total number of papillæ upon the body surface is enormous; an estimation of approximately 64,000 to the square inch has been made. The curved and parallel ridges previously mentioned as seen upon the palms are due to an arrangement of papillæ in rows. Each papilla is provided with a vascular loop or a special nerve-ending; rarely both are present. The proportion of the vascular to the nervous variety is about four to one; hence it is that the especially sensitive areas of the skin contain the greater number of papillæ.

The epidermis or cuticle is the portion of the skin intervening between the corium and the external world. Though structurally in most intimate relation with the true skin, by derivation it is totally distinct from it, being developed from the epiblast of the embryo, whereas the corium springs from the meso-blast. As the epidermis is avascular, nourishment is provided by means of juice-spaces in the deeper portions. The lower cells are therefore soft and succulent, and the extent of the change necessary to transform them into the dry, horny, and flat cells of the skin surface is readily apparent.

For purposes of description the epidermis is divided from within outward into four layers, the stratum mucosum, the stratum granulosum, the stratum lucidum, and the stratum corneum. The stratum mucosum, called also the rete mucosum or Malpighii, the mucous or prickle layer, consists of several superimposed strata of cells, which fill in the inter-papillary spaces of the corium, and present an undulating, plane surface to the layer next above. The cells in general are rich in protoplasm, have clearly defined nuclei, are columnar and polygonal in shape, becoming flattened as the surface is approached, and are provided with radiating, spine-like, protoplasmic processes or "prickles," which anastomose and interdigitate one with another. A viscid intercellular cement-substance is present, permeated by channels for the passage of nutritive fluids. The layer of cells in immediate contact with the corium has been aptly termed the stratum germinativum, since it is by multiplication of these that both physiologic exfoliation and pathologic loss of the epidermis are restored. The pigment which gives color to the skin is found in this layer, and nerve fibrils are abundantly present between and within the cells. The stratum granulosum is a narrow band of cells distinguished by the appearance of granules within the cell protoplasm. These are highly refractile, and are composed of keratohyalin, a substance believed by some to be the antecedent of keratin, the horny material in the cells of the skin surface. The stratum lucidum is also narrow, and is made up of more or less flattened cells, with faint nuclei and a homogeneous and lucid-appearing protoplasm. The granules of the preceding layer have totally disappeared, and instead a substance called eludin is found diffused throughout the cell body. This is re-

garded by some as a solution of the keratohyalin in the cell protoplasm. Others consider it a totally distinct body and not related to the product keratin. The stratum corneum is the most superficial layer. It is relatively thick, and its component cells are flat, dry, horny, and resistant, from the presence of keratin. Nuclei are absent or very faintly outlined. By special treatment the remains of the "prickles" may be detected. A well-grounded assertion has been made that the succulent protoplasmic spicules of the rete, by desiccation and other change, give origin to the keratin of the corneum. Constant exfoliation of the superficial cells of the skin is in progress, the loss of substance being compensated by growth from below.

The vascular supply of the skin is abundant. The numerous arterial branches emerging from the deeper tissues divide and subdivide to form an intricate horizontal network of vessels in the subcutaneous tissue. A second plexus is formed by division of radicles from the first at about the level of the papillary bases. From these arterioles capillary loops extend into the papillæ. The distribution of veins and venules for the return of the blood is practically the same as that of the vessels for the arterial flow; the venous channels, however, are considerably larger. For the passage of lymph, juice-spaces and lymph-vessels exist. The former are mere excavations in the intercellular cement-substance, communicating with one another, and eventually emptying into lymphatic vessels. These latter are channels with definite endothelial walls; they appear first at the bases of the papillæ as blind terminals, and by anastomoses from dense plexuses in the corium and subcutaneous tissues. The vessels receive the lymph from the juice-spaces through openings between the vascular endothelia, and eventually discharge their contents into the veins. The lymph which nourishes the epidermis flows from the papillary apices, percolates between the cells of the rete, and returns by way of the interpapillary spaces.

The nerves of the skin are (sensory) medullated and (vegetative) non-medullated. The latter form a dense plexus immediately beneath the rete mucosum; thence fibrils ascend, penetrating as far as the granular layer, and terminating either within or between the cells of the rete. Special nerves of non-medullated variety, known as vaso-motor nerves, are distributed to the muscle-fibres of the vessel-walls. The medullated nerves are confined to the papillary and subcutaneous layers, and are peculiar in that they terminate in special end-organs. Three varieties of these are found in man: the corpuscles of Krause, the corpuscles of Meissner, and the Paccinian corpuscles. While these differ in minute structure, in general all may be described as round or oval bodies, made up of concentric layers of connective tissue, enclosing the blunt or coiled termination of a nerve which enters at one pole of the mass. The first two kinds are found within and beneath the papillæ, especially in sensitive parts, while the Paccinian corpuscles occur in the subcutaneous tissue throughout the body. Trophic nerves are present in the skin, they belong to the vegetative system and are non-medullated. Muscle-fibres of the

smooth or unstriped variety are found in the corium of certain parts, especially the face. The principal muscular structures in the skin, however, are the arrectores pilorum. These are smooth muscle-bundles which arise from the lower portion of the walls of the hair-follicles and extend obliquely upward to be inserted into the pars papillaris of the corium. Contraction of these muscles produces erection of the hair, or on the glabrous skin the condition known as "goose flesh." The pigment of the skin resides in the lower cells of the rete mucosum. It appears as black granules of melanin within the cell protoplasm, chiefly about the nuclei. In the dark races the pigment is found in the superficial cells, in some cases even in the corneum. The tint of the skin is also influenced by vascularity. Many theories have been advanced as to the origin of the skin pigment; it seems most probable that it is derived from the coloring matter of the blood in the corium, and thence carried to the rete by wandering cells. Two kinds of glands exist in the skin; the sweat, or sudoriparous glands, and the sebaceous or oil glands. The sweat-glands are found in the hypoderm and lowermost portion of the corium. Each consists of a single long tubule, with a blind extremity, coiled many times upon itself to form a round or oval mass, from the upper part of which the excretory duct ascends. This is merely a straight portion of the tube slightly modified; it enters the rete opposite an interpapillary space, and after an irregular and spiral course through the epidermis opens upon the free surface of the skin, forming the sweat-pore. Besides the single layer of secretory cells, an investing membrane, unstriped muscle fibres and nerve filaments compose the tubule, and many blood-vessels are distributed in and about the coils. The duct has a lining of several layers of cells, and a more distinct investing membrane; in the rete these disappear, and through the corneum no definite lining exists. The sebaceous or oil glands are usually found in connection with the hair-follicles, but may occur where hair is absent, as on the lips. Their seat is the corium; each consists of one or several, sometimes many, pear-shaped lobules, lined with epithelium and invested with fibrous tissue. All the lobules open into a common gland-cavity, which in turn discharges into the upper portion of a hair-follicle. The product of the gland, called sebum, is formed by fatty degeneration of the epithelial cells within the lobules; its extrusion is favored by the contraction of the arrector pilorum, which compresses the gland against the hair root.

Hairs, though quite generally distributed, are absent on the palms, soles, the dorsum of the last phalanges of the fingers and toes, and the lips. They vary greatly in amount, quality, and distribution, these being influenced by age, sex, climate, racial and individual peculiarities. A separation of hairs into three classes may be made: long hairs, over two inches in length, found on the scalp, axillæ, pubes, and bearded portion of the face; bristle hairs, short and stiff, as those comprising the eyebrow and eyelashes; and downy hairs of lanugo, short, fine and soft, found on parts of the face, the trunk and the extremities. Each hair may be divided into two parts; the shaft, or portion projecting

above the skin surface, and the roots, or part imbedded in the skin. The shaft is made up of the cuticle, a single layer of imbricated cells covering the exterior; the cortex or main body of the hair, composed of spindle-cells, massed into elongated bundles; and the medulla or pith, of irregular cells containing air-vesicles. The color of hair is due to the presence of granular and diffuse pigment in the cortical substance, and to air in the cortex and the medulla. The hair-root is seated within the hair-follicle; its extremity is expanded into the hair-bulb, which is invaginated by the hair-papillæ carrying a vascular supply. In the hair-root the cells comprising the layers mentioned are softer, and more nearly approach the character of the rete-cells, from which the hair is derived. The hair-follicle is the elongated pouch-like depression which receives the hair-root. It is usually obliquely set, and in detail of structure is rather complex. A better understanding of its formation may be had if it be remembered that the follicle is merely an invagination of the skin-layers; the outer portion, therefore, is made up of the derma, while the inner layers are furnished by the epidermis. Hence a dermic coat and an epidermic coat are distinguished. Each of these is further divided into layers; the dermic coat into three, namely an external, fibrous and vascular; a middle, fibrous, possibly muscular in part; and an internal, thin and hyalin. The epidermic coat has several layers, the nomenclature of which is not entirely fixed. These, too, are quite complex in structure and for practical purposes a division without description into the outer root-sheath, the inner root-sheath and the cuticle of the root-sheath will suffice. The first two are by some regarded as a part of the hair proper. These strata are derived entirely from the rete mucosum by differentiation; the corneum does not enter the follicle beyond the opening of the sebaceous gland.

The horny formations upon the distal portions of the dorsum of the fingers and toes are strangely unlike the general skin in appearance, yet they are derived directly from the cells of the rete mucosum. For description, the nail is divided into two parts: the nail-body, or uncovered portion, and the nail-root, or portion imbedded in the tissues. The entire nail rests upon the nail bed or couch. The part beneath the nail-root is known as the matrix. The depression into which the nail is set posteriorly and laterally is the nail-groove. The skin overlying the imbedded portions is the nail-fold and the adherent film extending onto the nail-body from the nail-fold is termed the nail-skin. The lunula, the white curved border seen at the base of the nail represents the distal border of the matrix. The tissues beneath the nail are dense and vascular, but are poorly supplied with nerves. The papillæ are numerous and their arrangement in rows produces the longitudinal striæ seen on the surface of the nail. The hypoderm is devoid of fat and is closely adherent to the periosteum of the phalanx, thus presenting a solid foundation upon which the nail may rest. Growth takes place from the matrix; although the rete mucosum underlies the entire nail, only the rete-cells of the matrix undergo the transformation into horny nail-substance.

Physiology of the Skin.—The complex histological structure of the skin and its appendages is necessitated by physiological requirements. As the living encasement of the body, its functions are necessarily related to external and internal factors. Thus it protects the organism from harmful influences from without; it provides a sense-organ that is necessary to a correct interpretation of the external world; it contributes largely to the regulation and conservation of body heat; and it removes from the organism quantities of waste and harmful material. All the dermal structures participate in the protective function of the skin. The connective and adipose tissue of the hypoderm; the dense fibrous and elastic meshwork of the corium; and the horny cells of the epidermis, rendered unctuous by glandular secretion, are together admirably adapted to guard the deeper structures from injury by mechanical violence, to prevent undue loss of heat and fluids from within, and to resist the penetrating or destructive action of fluids from without. The hair in man, especially on certain parts, is protective from violence and thermal change, but not to the same degree as in animals; in them it is obvious that the fur, composed of densely set hairy filaments distributed over the entire body, must act as a potent agent in turning aside harmful encroachments from the exterior, and in conserving body heat. The cutaneous nerves contribute to protection in that the sensibility of the skin may warn the individual of possible dangerous contacts, often in time to prevent harm.

Sensation in the skin is provided for by the presence in abundance of nervous filaments and special nerve end-organs. Although many kinds of sensations are perceived through the skin, the exact part performed by each of the several varieties of nerve terminations is not fully known as yet. By means of the tactile sense the individual is able to judge the shape of an object in contact and the portion of the skin touched by it: he can appreciate its weight and recognize whether it is hot or cold. These varieties of tactile sense—locality sense, pressure sense and temperature sense—are not resident in one and the same variety of nerve or nerve-termination. Pain has been considered an overstimulation of sensory fibres; experimentation, however, seems to show that special nerves are concerned when pain is felt. The skin through perception of pressure and tension, is in part responsible for muscular sense, by means of which the individual is cognizant, without the aid of the eye, of the position of his body with reference to surroundings. Special sensations, as itching, burning, tickling, creeping, etc., are perceived through the skin; the nerves concerned in their reception and conduction are known chiefly as belonging to the vegetative system.

The skin plays an important rôle in the regulation of bodily temperature. The action of excessive heat from within or without, upon the vasomotor nerves distributed to the blood-vessels of the skin, causes the latter to dilate. An increased amount of blood is thus brought to the skin, where it is cooled by conduction and radiation and also by evaporation. The latter effect results from the increase of moisture on the skin, following an acceleration of sweat-gland secretion, due to augmented blood-supply.

On the other hand, cold, acting upon the vasomotors, leads to contraction of the vessels; a diminished amount of blood enters the skin; evaporation is reduced by the checking of sweat secretion; and bodily heat is conserved.

The secretory and excretory functions of the skin are carried on by the sebaceous and sweat glands. The product of the former, a fatty, unctuous material, cannot be strictly regarded as a secretion. Its purpose rather is to anoint the hair and skin, thus keeping the latter soft and preventing heat loss by evaporation, and maceration of the epidermis by moisture. The sweat, however, is a true excretion and as organs for the removal of waste products the sweat-glands are most important. Various estimations have been made of the amount of sweat produced in 24 hours; the average is probably about one and one-half pounds. This can be greatly increased by muscular activity, by high external temperature and by the use of certain drugs; it is obvious, therefore, that considerable material can be removed from the body through the skin, a fact of great importance in the treatment of certain diseases. The sweat itself is about 99 per cent water; the remaining 1 per cent represents a number of complex fatty bodies and mineral salts. It may be alkaline or acid in reaction; acidity is in part due to admixture of fatty acids from the sebaceous secretion. It has been claimed that the sweat-glands produce no fat, but it is generally accepted now that this is not true, since the secretion in the palm, a part devoid of sebaceous glands, unquestionably contains fatty products.

The skin possesses a respiratory function, but it is comparatively insignificant. Carbonic acid gas is given off and oxygen absorbed, the relative amounts of each as compared with those from the lungs, being 1-220 of the former, and 1-135 of the latter. The interchange probably takes place through the sweat-pores. The skin also exhibits a certain degree of absorptive power. This is but slight in the undamaged skin. If the horny layer be removed, or if the substance be forced into the glandular ducts, absorption may take place readily, especially of certain substances.

Diseases of the Skin.—Abnormal or diseased conditions of the skin, as of other organs, are recognized by manifestations called symptoms. These are all referable to one of two categories: subjective symptoms and objective symptoms. By the former is meant those which are appreciated only by the patient himself; by the latter, those which may be detected by the examining physician. Subjective symptoms in purely cutaneous diseases are, in many instances, wanting; when present they are manifested in some form of abnormal sensation, as burning, prickling, tingling, smarting, creeping or itching; in diminished sensibility or anesthesia; in increased sensibility or hyperæsthesia; or in pain, which latter may be burning, shooting, boring or aching. Of all subjective symptoms, itching or pruritus is most common; it is constantly present in many conditions, though often in varying degree.

Objective symptoms are vastly more important. To the person afflicted they often seem the visible manifestations of disfiguring, repulsive disease, and their appearance is therefore dreaded; to the dermatologist they stand for facts and principles which, when aggregated,

constitute the major portion of his special knowledge, and which he must know and understand most thoroughly if he shall hope to be proficient. Any alteration from the normal in the texture and appearance of the skin is termed a lesion. Lesions are variable in appearance, character and manner of evolution, which fact is the basis of their subdivision into two general classes: elementary or primary lesions; and consecutive or secondary lesions. These terms are self-explanatory; the former are lesions which at their inception present a certain type; the latter are those which are produced by progressive alteration from a previously existing type. The classification is not entirely accurate, however, for under certain conditions a lesion of a primary type may appear as secondary. Briefly described, the objective cutaneous characters which are considered primary, eight in number, are: (1) Macules (spots or stains), circumscribed alterations in the color of the skin, without elevation or depression of the surface. They are variable in size, shape, color, duration and as to cause of the dyschromia. A familiar example is the "freckle." (2) Papules (pimples), small, usually superficial, pinhead to pea-sized, circumscribed, solid elevations of the skin. These, too, differ in size, shape, color, duration and cause. The "pimples" or papules of acne in young persons, illustrate this type of lesions. (3) Tubercles (nodules), solid, fairly circumscribed, pea-sized, deep-seated elevations, usually persistent in character. These are in reality large papules, or more properly, intermediate lesions between the papule and the tumor, to be next described. In severe acne tubercles are sometimes found. (4) Tumors, soft or firm, more or less circumscribed elevations of the skin, varying in size and shape, and seated deeply, in the corium and subcutaneous tissues. As the papule merges into the tubercle, so the tubercle passes over into the tumor; thus at one extremity of the series stands the pinhead-sized papule, at the other, the egg-sized or larger tumor. (5) Wheals, circumscribed, reddish-white, cedematous elevations of variable size and shape, usually evanescent in character. This form of lesion occurs typically in the condition known as urticaria (q.v.) or nettle-rash. It is angioneurotic in origin and is always accompanied with subjective symptoms, especially itching. (6) Vesicles (little blisters), circumscribed elevations of the horny layer of the epidermis, pin-point to pea-sized, with limpid, lactescent or sanguinolent contents. This form of lesion may at times be secondary, since it can develop on a previously existing papule, as illustrated in smallpox. (7) Pustules, pin-point to filbert-sized, circumscribed cutaneous abscesses, having an epidermal roof-wall. The skin surrounding the base usually shows an inflammatory areola. They are developed very frequently from vesicles, less often from papules. It is, in fact, somewhat questionable to class the pustule as a primary lesion. They are seen commonly in acne. (8) Blebs (large blisters), irregularly shaped elevations of the epidermis, varying in size from a pea to a goose egg, containing clear or opaque fluid. This lesion is well illustrated by the blister following a severe burn.

The secondary or consecutive lesions of the skin, six in number, are: (1) Excoriations (abrasions, scratch-marks), variously sized and

shaped areas, representing loss of superficial cutaneous tissue, the result of mechanical violence. (2) Fissures, linear cracks or wounds of variable size, involving the epidermis, or the epidermis and corium, due to disease or external injury. These are seen not infrequently in the palms or about the angles of the mouth, when from any cause the parts have become inelastic. (3) Scales, dry, laminated, masses of epidermis which have separated from the underlying tissue as the result of some morbid process. They may lie in masses upon the skin, or be constantly exfoliated from the surface. Variations occur in color, consistency and form. (4) Crusts (scabs), dried, effete masses of exudation, mixed with epithelial debris, varying in size, shape and color. (5) Ulcers, variously sized and shaped losses of cutaneous substance, the result of preceding disease. In this form of lesion, differences are found in size, outline, depth, condition of floor, margins, etc. A familiar example is the leg ulcer in old people. (6) Scars, new connective-tissue formations replacing loss of substance in the corium or deeper tissues.

Besides recognizing the presence and detailed appearance of the lesions upon the skin, the diagnostician must also note their distribution upon the body surface, their general arrangement and their configuration when grouped together. All these considerations help to elucidate the condition present.

In the etiology of skin diseases many factors are operative. For convenience of description these may be classed as internal causes and external causes. Among internal causes, heredity may be mentioned first. While not many cutaneous diseases are inherited, the predisposition to them may undoubtedly be passed on to the child. This predisposition probably is due to some form of tissue vulnerability to influences which otherwise might not suffice to produce disease. Disorders of internal organs are frequently effective. Their exact relation to the skin disorder may not be entirely clear; but the joint association of internal and cutaneous disease in many instances is too regular and frequent to be a mere coincidence. Thus, gastrointestinal derangements may produce erythema, eczema or urticaria; whether these are due to the intestinal disorder or both due to a more primary emotional disturbance is still an open problem; kidney disease may cause an eczema or pruritus; diabetes is not infrequently accompanied with boils, carbuncles, gangrene, dermatitis, urticaria or pruritus. Syphilis is attended with many forms of eruption; gout is frequently associated with eczema or psoriasis, and rheumatism with erythema and purpura. Asthma, eczema and urticaria are often found together. Lastly, emotional derangements may produce an array of functional disturbances in the skin and through reflex action on the vasomotor nerves may be the determining factor in the development of cutaneous lesions. The sexual system unquestionably exerts an influence on skin diseases. The prevalence of acne in the young, following puberty, is well known, and various cutaneous derangements are associated with physiological crises and pelvic disorders in women. Food may produce skin eruptions. Urticaria is not uncommon after ingestion of shell-fish, cheese or strawberries and the list of skin-irritating articles could be greatly extended.

Eczema, acne and inflammatory conditions are greatly influenced by quantity and kind of food taken. Alcohol in inflammatory lesions is especially harmful.

Any of the many types of skin eruptions may develop following the use of certain drugs, the list of which is very extensive. Among those in most common use which may disturb the near tissues and hence the skin, are quinine, belladonna, morphine, arsenic, potassium bromide and iodide.

Climate may be considered an external factor. Warmth and moisture found in tropical and subtropical countries are especially favorable to the growth of certain parasites in the skin. Cold and moisture tend to induce eczematous conditions. Certain diseases are distinctly prevalent in certain countries, but the fact is not always due to climatic influence alone. The seasons differ also in their effect. Winter aggravates pruritus, eczema and psoriasis; summer improves them. Light, heat and cold are capable of producing inflammatory conditions. On the other hand, light is distinctly ameliorative in certain diseases, as psoriasis. Clothing when improper in amount, harsh of quality, poorly fitting, or uncleanly, can give rise to inflammation of the skin. Irritants of various sorts, whether mechanical, chemical or medicinal, can likewise awaken inflammation. Scratching and other traumatism are frequent causes of hyperæmia and dermatitis. Parasites, both vegetable and animal, are the most important of all external causes. A very large number of cutaneous diseases are traceable to them. Among the more common diseases produced by vegetable organisms are boils, carbuncles, various pus infections and the different forms of ringworm; by animal parasites, scabies and dermatitis from pediculi.

The number of cutaneous disorders under classification is about 170, but this does not include all tropical diseases. Of this seemingly large number, many are rare, others are seen but seldom, while a few are very common. Dermatologists have not agreed upon a uniform classification of skin diseases; their differences, however, largely concern minor distinctions. The following general classes are usually given as a basis for further subdivision: (1) hyperæmias; (2) inflammations; (3) hemorrhages; (4) hypertrophies; (5) atrophies; (6) new growths; (7) neuroses; (8) diseases of the appendages; (9) parasitic affections. By some authorities diseases of the appendages are considered among the other classes, as inflammations, hypertrophies, etc. The difference in the classification, however, is not essential, being rather one of convenience.

Assistant Professor in Dermatology, Rush
Medical College, Chicago.

SKINK, a genus (*Scincus*) of lizards of the cosmopolitan family *Scincidae*, characterized by a conical head, with well-developed eyelids, and covered with symmetrical shields. The body is protected by bony plates underlying the scales. No thigh pores exist and in some genera the limbs may be hidden beneath the skin. In the genus *Scincus* itself the scales are of thin and smooth texture and the tail is rounded and tapering and is unprovided with spines. The body is somewhat spindle-shaped and is flat below. Five toes exist on each foot and the toes are of flattened shape and fringed on the sides. The palate is grooved longitudinally and is provided with teeth. The common skink (*Scincus officinalis*) occurs in North Africa and in India. It inhabits sandy places and when alarmed burrows swiftly beneath the sand. Its specific name is derived from the fact that formerly it was thought to possess valuable medicinal properties and among savage tribes it is regarded as an antidote to poison. In classic ages its virtues were much reputed and the head and feet of these lizards were imported to Rome in large quantities preserved in white wine. Its color is a variable reddish, marked above with cross bands of darker hue, while below it is of a white color, tinged with silvery lustre. The average length is from six to seven inches. The family is represented in the United States by several genera, of which *Eumeces* is the most prominent and is represented by several well-known species. Consult Holbrook, 'North American Herpetology' (Philadelphia 1848); Cope, 'Crocodilians, Lizards and Snakes' (Washington 1900); Gadow, 'Amphibia and Reptiles' (New York 1901).

SKINNER, skin'ér, Aaron Nichols, American astronomer: b. Boston, Mass., 10 Aug. 1845. He was educated at Beloit College, Wis., and at the University of Chicago, was assistant at the Dearborn Observatory, Chicago, in 1867-70, and assistant astronomer at the United States Naval Observatory in 1870-98. Since 1898 he has been professor of mathematics in the United States navy. He was retired from active service in 1907 with the rank of commander; he determined the position of 8,824 stars in the zone declination—14° to —18° as a contribution to the great star catalogue of the Astronomische Gesellschaft from declination—23° to +80° which was published as "Washington Zone Observations" and also as a "Zone Catalogue" conducted the expedition of the Naval Observatory to Sumatra to observe the total solar eclipse of 17 May 1901.

SKINNER, Charles Rufus, American legislator and educator: b. New York, 4 Aug. 1844. He was educated at Clinton Liberal Institute, and in 1870-74 he was manager and city editor of the *Daily Times*, Watertown, N. Y. He served in the New York assembly in 1877-81, and in Congress in 1881-85. He was New York State deputy superintendent of public instruction in 1886-92; and superintendent in 1895-1904. He was president of the National Education Association in 1897. In 1906-11 he was assistant appraiser of the port of New York. Author of 'New York Question Book' (1890); 'Manual of Patriotism for the Schools' (1900); 'The Bright Side' (1909), etc.

SKINNER, John, Scottish song writer: b. Balfour, Aberdeenshire, 3 Oct. 1721; d. Aberdeen, 16 June 1807. He was educated at Marischal College, Aberdeen; taught school for a time; took orders in 1742 in the Scottish Episcopal Church and settled at Longside, Aberdeenshire. He suffered during the period of persecution of Jacobite ministers after 1745-46 and in 1753 spent six months in prison for preaching in his own house. He is remembered for his songs, which placed him, in the estimation of Burns, as one of the foremost of Scottish song writers. Among these are 'Tullochgorum'; 'Ewie wi the Crookit Horn'; 'John o' Badenyon'; 'The Marquis of Huntly's Reel'; 'Lizzie Liberty'; and 'The Old Man's Song.' His prose included 'A Preservative against Presbytery' (1746); 'Dissertation on Job's Prophecy' (1757); 'Ecclesiastical History of Scotland' (1788); His 'Songs and Poems' edited by Reid appeared in 1859.

SKINNER, Otis, American actor: b. Cambridge, Mass., 1858. He made his début Nov. 1877 as Jim in 'Woodleigh' at the Philadelphia Museum; New York début at Niblo's Theatre 1879. Assumed important roles with Lawrence Barrett, Augustin Daly and Madame Modjeska. After 1902 he was prominent as a star in plays of varied character under his own management and in conjunction with Charles Frohman.

SKINNER, William, American manufacturer: b. London, England, 1824; d. Holyoke, Mass., 28 Feb. 1902. He came to the United States in 1845 and settled in Northampton, Mass., where he engaged in the silk business. He became a partner in a silk manufacturing firm in 1848 and in 1851 established a business at Williamsburg, Mass. His factories being destroyed by the Mill River flood in 1874, he rebuilt them in the same year at Holyoke. He was actively engaged in philanthropic work, was a generous benefactor of Vassar, Smith and Holyoke colleges, built a gymnasium for Dwight L. Moody's school in Northfield, Mass., was president of the local city hospital and also of the Manufacturers' Association of Holyoke.

SKINNERS, bands of marauders, adherents to the American cause who infested what was considered neutral ground along the Hudson River in New York State, during the American War of the Revolution. The Skinners carried on a vigorous guerrilla warfare, being opposed by the Cow-boys, as the marauding adherents to the British cause were called. In some instances the Skinners did serviceable work for the American army, harassing small detachments of British soldiery, scouting and foraging parties, and acting as scouts for the Americans when occasion demanded. It was a party of three Skinners who intercepted André (q.v.) on his way back to New York, after receiving treasonous papers from Benedict Arnold (q.v.) at West Point. This was the chief service performed by the Skinners, who, like the Cow-boys, operated principally in Westchester County and were not particularly scrupulous as to the party to which their victims belonged.

SKIPPER, a butterfly of the family *Hesperiidae*. The body is short and thick, head large, eyes prominent, antennæ short, with the knob curved like a hook or bent to one side,

legs six, and the four hindmost shanks armed with two pairs of spurs. Skippers are generally rich brown, marked with yellow spots. The species are quite numerous, and expand from one and one-half to two and one-half inches. They owe their name to their jerky flight. The cheese-mite has also been termed skipper.

SKIRMISHERS are soldiers acting in loose array in front and on the sides of an army, in fighting carried on in an open country. It is the duty of the skirmishers to cover the line of advance of an army and to guard its flanks, so as to protect against surprise by the enemy. The skirmishers usually operate considerably in advance of the main body, from a mile to five miles, advancing in files of two men, front and rear, with a distance of about six paces between them. Skirmishers fire independently and at their own discretion and in modern warfare do not adhere strictly to the rules of the tactics, either as to their disposition or as to alternating between the files, in firing. Skirmishers were frequently used in the United States Civil War to draw on a battle or to cover the movement of the main body in their rear. When attacked by cavalry in open ground the skirmishers are supposed to close up ranks, forming what are known as rally squares. The manual of infantry tactics provides that every company of skirmishers shall have a small reserve, whose duty it is to fill vacant places and furnish the line with cartridges, and to relieve the fatigued. In trench fighting the strategy is quite different.

SKIRRET, a hardy perennial umbelliferous plant (*Sium sisarum*) about four feet high, with pinnate leaves and tiny white flowers in compound umbels. It is indigenous to Asia, and has been cultivated in rich, moist soil, for its edible, fleshy tubers, which are about as thick as a finger and grow in clusters, united at the base of the stem, and are long, cylindrical, and somewhat jointed. They have a sweetish taste, resembling parsnips, are somewhat floury, and are quite tender, except for a woody core, which must be removed before cooking. It is a winter vegetable, boiled and served like salsify, but is of minor importance at present.

SKITSUISH. See SALISHAN INDIANS.

SKITTLES, a favorite game in England much resembling the American game of Bowls, (q.v.). It is played in a covered skittle-alley, usually indoors. From four to nine skittles or large wooden pins about a foot high with flat bottoms are set upright at one end of the alley a foot apart. They are arranged in a square, and one angle of this square is turned toward the player, or thrower, who stands at the other end of the alley, 21 feet away. The thrower uses a large wooden ball, about a foot in diameter, and which is not always round, which he throws along the floor of the alley with sufficient force to bowl over the pins at the other end; the thrower is allowed to advance but one step in the act of throwing. The object of the game is to knock down all or as many of the skittles as possible, each throw counting so many points, and the one who makes the greatest number of points in a given number of throws wins the game. The game of skittles was introduced into England under the name of Kails in the 14th century, having been brought over from the French. It is

still popular and has developed in some places under the name of nine-pins, from the number of skittles used. In chess play, skittles is a rapidly played game, without effort at analysis of position.

SKLALLAM. See SALISHAN INDIANS.

SKOBELEFF, skō'bē-lyēf, **Mikhail Dimitrievich**, Russian general: b. near Moscow, 29 Sept. 1843; d. Moscow, 7 July 1882. He entered the army and served in Poland in the suppression of the insurrection of 1863-64; and later in the campaigns in the Caucasus and in Central Asia. In 1873 he was attached as colonel to General Kaufmann's staff when the city of Khiva was taken, and in 1875 commanded the expedition against Khokand. This province being annexed in 1876 with its name changed to Ferghana, Skobelev was appointed military governor; but at the outbreak of the Turkish war he hastened to the front, crossing the Danube on horseback. He held no commission until the second attack on Plevna in 1877 when he led three regiments, but was forced to sacrifice the advantage he had gained for lack of support. Being appointed lieutenant-general, he commanded the famous 16th division, with whom he turned back the left flank of the Turkish army, capturing 36,000 men, at the passage of the Balkans at Senova after Mirsky and Raditsky had failed. He led the advance upon Adrianople in 1878. His last military exploit was as commander of the expedition against the Tekke-Turkomans in 1880-81 and the conquest of Gök-Tepe on 12 January. He was promoted to the rank of general after the campaign.

SKODA GUN. See ORDNANCE.

SKOKOMISH. See SALISHAN INDIANS.

SKOPTZI, or **SKOPTSY**, a religious sect founded in Russia in the latter part of the 18th century by Kondraty Seliwanoff. His followers practise castration in the belief that it will purify their souls and render them fit to enter heaven. Since 1869, when their practices were discovered by the Russian government, attempts have been made to suppress the sect by penal measures, but it is still believed to include a number of influential persons in its following. See also RELIGIOUS SECTS.

SKOWHEGAN, skow-hē'gan, Me., town, county-seat of Somerset County, on the Kennebec River, and on a branch of the Main Central Railroad, 33 miles north of Augusta. The first settlement in this vicinity was made in 1792; Skowhegan was at first a part of the town of Canaan, but was separately incorporated in 1823 under the name of Milburn; in 1836 it was given its present name, which is the ancient Indian name for the place. In 1856 the village of Skowhegan was incorporated. The town of Bloomfield was annexed in 1861. The Kennebec here has a perpendicular fall of 30 feet, and this furnishes excellent water power. The town has an area of 50 square miles and has a fine public park, hospital and courthouse. The industries include lumber, pulp, flour and woolen mills, shoe factories, and manufactories of scythes, axes, etc., and oil-cloth. There are several banks and newspapers. The town has a high school, and a public library (founded 1867). Pop. 5,000.

SKRINE, John Huntley, English clergyman and author: b. Somerset, England, 4 April 1848. He was educated at Oxford, ordained a priest in the Church of England in 1874, and in 1873-87 was assistant master at Uppingham. He was warden of Trinity College, Glenalmond, in 1888-1902 and in 1897 he was appointed canon of Perth Cathedral. He has published 'Margaret of Anjou' (1870); 'Under Two Queens,' lyrics (1884); 'A Memory of Edward Thring' (1890); 'The Queen's Highway,' lyrics of the war (1900); 'Pastor Agnorum, A Schoolmaster's After-thoughts' (1901); 'The Mountain Mother,' sermons (1902), etc.

SKUA, or **JÆGERS**, a large gull of the genera *Stercorarius* and *Megalestris*, and especially of the latter, the former being more often called "jæger." They are usually classed as a sub-family of *Larida* (q.v.). They are predatory birds, rarely fishing for themselves, and generally pursue smaller gulls and terns, and compel them to drop or disgorge their prey. Only one species of true skua (*Megalestris skua*) enters the North American fauna and this is rare. The related jægers are remarkable in the possession of a cered bill and a pair of elongated middle tail feathers, though the latter character is less pronounced than in the true jægers. It is a large, robust bird, especially when adult, and is remarkable for its vigorous and varied flight and piratical habits. It breeds in the far north, making a flimsy nest on the ground and lays two or three deeply blotched eggs. This species is more common on northern European coasts and three species of jægers are also common to the two continents and range even much more widely. They are the pomarine jæger (*Stercorarius pomarinus*), 21 inches long, dusky and mottled above, brownish-white below; the Arctic or parasitic jæger (*S. parasiticus*), about 20 inches long, occurring under two different plumages, one entirely sooty, the other with white under parts, and *S. longicaudus*, the longtailed jæger, about 14 inches long, upper part of head black, upper surface brownish-gray, under surface white. The middle tail-feathers in this species project 10 inches, and the bird is called "marlin-spike" by sailors. Consult Selous 'Bird Watching' (London 1900).

SKULL, the skeleton of the head; the bony or cartilaginous framework of the head in vertebrates; a superior expansion of the vertebral column. Its shape differs in various animals. In man it is somewhat ovoid, the larger portion being at the top (the dome); and the whole is composed of flat and irregular bones—eight bones enclosing the cranial cavity and 14 forming the face. The skull rests and nods upon the first vertebra (atlas). It also rests upon a tooth-like process (odontoid process) of the axis, or second bone of the spinal column, which projects upwards through the atlas and forms a pivot or swivel, upon which the head rotates, the atlas also turning with it. The preponderance of the cranial portion of the skull over the face portion is most pronounced in man, because of the higher development of the brain. The cranial portion (cranium) is composed of the occipital, frontal, sphenoid and ethmoid bones, and the two parietal and temporal bones. These bones are united either by sutures (dovetail joints) or beveled edges.

The upper bones of the skull of a baby do not usually unite until months after birth, their condition allowing the brain to grow. The dovetail joints later in life fasten these bones together very firmly. This jointure, together with the strong buttresses in the temporal bones and the tie-beam function of the sphenoid, adapts an adult for carrying considerable weight upon the head without injury. If the upper cranial bones of a baby are united at birth or soon after, the child is usually an imbecile or idiot. The tissue of the flat bones of the skull is arranged in layers; the outer one was likened by the ancients to wood, the middle one to leather, and the inner one to glass. The cranial cavity contains the brain and proximal portions of the cranial nerves. See **BRAIN**; **CRANIAL NERVES**.

The principal opening of the skull is the foramen magnum for the transmission of the beginning of the spinal cord, the spinal accessory nerves, and the vertebral arteries. Other openings to the orbits, the interior of the temporal bones, etc., transmit the optic, auditory, and other nerves, as well as blood-vessels, and are so arranged that these nerves and vessels are not easily injured.

The bones of the face are the inferior maxillary, and the vomer, the two nasal, superior maxillary, lacrimal, malar, palate, and inferior turbinated. The inferior maxillary, or lower jaw, forms the chin (a distinctive feature of man), moves in mastication and speech, and is joined to the temporal bone by a ball-and-socket joint. The lacrimal bones are small bones forming part of the inner wall of the orbit, one of the principal openings in the face. The malar bones are the cheek-bones. The palate-bones assist in the formation of the outer wall of the nose, the roof of the mouth, and the floor of the orbit. The nasal bones form the bridge of the nose; the vomer forms part of the septum of the nose, separating one nasal cavity from the other. The superior maxillary bones (maxilla, the jawbone) form the upper jaw and a large part of the roof of the mouth, the outer wall of the nasal fossæ, and the floor of the orbit. The inferior turbinated bones extend horizontally along the outer wall of the nasal fossæ. The principal external openings of the skull in the face portion are the orbits, the mouth, and the nasal opening; in the cranial portion, the foramen magnum, and the external auditory canal. See **ANATOMY**; **HEAD**; **MEDULLA OBLONGATA**; **SPINE**; **SPINAL CORD**.

SKULL-CAP, any one of the labiate genus *Scutellaria*, bitter herbs, having square stems, simple, opposite leaves, and blue or violet flowers, in terminal or axillary racemes. The flowers have exserted ascending corollas, curved, with arched upper, and spreading lower lips. The calyx is campanulate, gibbous, and two-lipped, the upper one with a crested protuberance on top, that causes it, when in fruit, to very much resemble an ancient helmet, with the visor down, and to which the common name obviously refers. This skull-cap covers four nutlets, which are ejected by the upspringing of the pedicel, if bent down by an animal, for instance; and it is said that the visor directs these seeds on to the animal's coat, when they escape from between the lips. However, the lid soon falls off. Several species are culti-

vated, as the Siberian (*S. baicalensis*), producing during the summer many dark-blue flowers an inch long; and the whole genus is one of the handsomest of the many American mints, excepting (*S. galericulata*), which is not showy. The madwort (*S. lateriflora*) is a common slender herb in wet places, with ovate leaves and violet flowers, and was at one time supposed to be a cure for hydrophobia.

SKUNK, a representative of several genera of small carnivorous mammals of the weasel family (*Mustelidae*), of which they, with the badgers, constitute the sub-family *Melina*, characterized by having elongated toes with blunt non-retractile claws and no webs. The true skunks are notorious for the large size of the anal glands, and the offensive odor of their secretion. They are always black, marked by variously arranged and sharply contrasting bands and spots of white, and are exclusively American. Three genera are recognized. *Mephitis* includes the common typical skunks of relatively large size, with the skull arched above and the face short and truncated. There are 34 teeth with the following formula: i. $\frac{3}{1}$, c. $\frac{1}{1}$, p. $\frac{4}{1}$, m. $\frac{1}{1}$. The body is elongated, and usually much arched; the tail long and thickly covered with long, fine hair; the head small, with thick, blunt snout; the legs short, and the paws comparatively large, with five incompletely divided toes. The power, characteristic in some degree of all the *Mustelidae*, of forcibly discharging the fetid secretion of the anal glands is enormously developed. Ten species have been differentiated in North America ranging throughout the continent, but as they differ little in habit, the common skunk (*M. mephitis*) may be taken as typical of the whole genus. This species, as now limited, is confined to the Eastern States, where it is exceedingly common, particularly in the farming districts of New England. It is about the size of a cat and has fur of a glossy black; on the forehead is a patch of white diverging into two lines which extend the whole length of the back and meet again in the beautiful bushy tail. The tip of the tail is also white, and, as it is usually carried erect, the white is regarded by some naturalists as a "warning color." Thus Belt writes: "The skunk goes leisurely along, holding up his white tail as a danger flag for none to come within range of its nauseous artillery." It chiefly frequents high-lying, bushy, or rocky districts and the banks of the rivers, usually remaining concealed in its burrow by day, but emerging at dusk in search of the worms, insects, birds, small mammals, and their young and the eggs of ground birds which form its food. At times it becomes quite destructive to poultry, but offsets this by clearing out houses of rats and mice.

Its movements are slow and leisurely. It never attempts to run away if pursued, for, feeble and defenseless as it looks, it is most efficiently protected by the possession of a nauseous fluid, the discharge of which neither man nor beast will wittingly provoke. When attacked the skunk turns its back, erects its tail, and, by means of a muscular contraction, ejects the contents of its anal pouches from the protruding orifices of a pair of ducts with a force that carries them to a distance of 10 or 15 feet. So penetrating is the evil odor of this

fluid that it may sometimes be perceptible a mile off, and so persistent is it that clothes defiled by it can rarely be entirely purified. The fluid will excite severe inflammation of the eyes, and cases are cited of Indians who have thus lost their eyesight. Few carnivorous animals care to attack the skunk, and this immunity results in a life of comparative ease, with a loss of agility and an assumption of corpulency in striking contrast to the slender and active weasels. The skunk is hunted for its fur, which is in considerable demand. During the fall and winter skunk-hunting is an industry of considerable importance in Maine, and that State alone yields annually between 100,000 and 200,000 skins, most of which are shipped to Philadelphia where they are prepared for shipment to Paris, chiefly in the guise of "monkey" skins. Skunk-farming has become established as a regular business in some parts of New England and the Middle States, and is regarded as quite profitable. The animals become used to attendance and rarely annoy by discharging. They are killed when grown, the bodies used as fertilizer, and the foul smell of the skins removed by heat and smoke. Skunks are trapped, killed with clubs or by means of dogs especially trained to pounce upon them before the fluid can be discharged. Their bodies yield an oil used in making liniments, and the flesh is sometimes eaten and reported as being very sweet and tender.

Skunks usually raise from 6 to 10 kittens in a season. If taken young they are easily tamed and make pretty pets, for they are cleanly in habit and rarely emit their offensive secretion save when provoked. The families remain together for about a year, and during the coldest months of winter they all hibernate together in the same burrow. It seems to be fully established that the skunk is affected with a disease similar to canine rabies and that fatal cases of hydrophobia have resulted from the bite of even apparently healthy animals.

The skunks of the genus *Spilogale* are smaller and differ in the depressed skull, unarched above. The white stripes are more numerous and often incomplete. The 12 described species are mostly confined to the western and southern portions of the United States and to Mexico. One species, the little striped skunk (*S. ringens*), is abundant from Florida to Virginia and westward to Mississippi. It is about 14 inches long, with a broad white patch on the forehead, four white parallel dorsal stripes much broken behind, and a white tip to the tail. The third genus (*Conepatus*) has only 32 teeth, one of the upper premolars being absent, and differs in other respects from the foregoing. *C. mapacito* is the typical skunk of South and Central America and this or a closely related species extends through Mexico into Texas. Except that it does not hibernate its habits are essentially like those described for the common skunk. Consult Coues, 'Fur-bearing Animals' (Washington 1877); Merriam, 'North American Fauna, No. 4' (Washington 1890); Ingersoll, 'Wild Neighbors' (New York 1897); Halbrook, F. M., 'Skunk Culture for Profit' (Chicago 1915).

SKUNK-CABBAGE, a common plant (*Spathyema fatida*) of the order of *Araceæ*,

found in colonies in bogs in eastern North America, and also in Asia. It begins to bloom in winter and the spathes, which are pushed through the mud thus early, are cowl-like, having a twisted point overhanging the orifice; they are fleshy, curiously mottled with purples, greens and yellows, and protect a round spadix in which four-merous perfect flowers are imbedded. These are purplish and are the first pollen-bearers to be visited by bees.

SKUPSHTINA, skūpsh'ti-na, the national assembly of the Servians. See **SERVIA**.

SKY. See **ASTRONOMY**; **ATMOSPHERE**; **CLOUDS**.

SKY-ROCKET. See **PROJECTILES**.

SKYE, ski, Scotland, the largest island of the Inner Hebrides, off the western coast of Inverness, covers an area of 643 square miles. Its longest dimension is 48½ miles but no point is over five miles from the salt water. Its scenery is celebrated. The deeply indented coast is lined by bold and lofty cliffs or basaltic pillars; the interior is mountainous moorland, interspersed with lochs. The Cuillin Hills at the south form the highest points of land, Banachdich being the highest, 3,234 feet, while toward the east, Blavin reaches an elevation of 3,042 feet. The Red Hills (2,403 feet) rise toward the northeast. The acreage under cultivation is very small and there are few trees. The climate is variable and moist. Much of the land consists of pasturage. Sheep and cattle are raised, and fishing is a chief occupation. The famous castles of Armadale, Duntulm and Dunnegan draw many summer visitors. Loch Coirnisg, lauded by Sir Walter Scott in 'The Lord of the Isles,' is a small fresh-water lake near the Bay of Scavaig. Portree, the chief town on the east coast, has a good harbor and is the southern terminus of a steamer line. Seals are sometimes still seen on the most isolated rocks, and formerly there were walrus. There is a distillery at Carbost, where a well-known brand of whisky is produced. The eastern end of the island is very close to the mainland at two points, where there are ferries. The greatest population was attained in 1841, being 23,082; it has since steadily diminished, a recent estimate being 13,000. Gaelic is spoken more than English.

SKYE TERRIER. See **TERRIER**.

SKYLARK, a European lark (*Alauda arvensis*), one of the most popular European cage birds from the variety and power, rather than the quality, of its song, and the ease with which its health is preserved in captivity. It inhabits all of Europe, many migrating south in winter. The adult male is about seven inches long; crown dark brown with paled edges, forming a crest, upper parts brown, each feather with a spot of darker hue; throat and upper part of breast grayish-brown, spotted with dark brown, abdomen yellowish-white, deepening into pale brown on the flanks, tail feathers various shades of brown. The female is a little smaller than the male.

The bird is famous wherever English is spoken and English poetry is read, for its flight-song, begun in early spring, and continued all through the summer. When it first rises from the earth, its notes are feeble and interrupted; as it ascends, however, they gradually swell

to their full tone, and long after the bird has reached a height where it is lost to the eye, it still continues to charm the ear with its melody. It mounts perhaps more perpendicularly than any other bird, and by successive springs, and descends in an oblique direction, still chanting its rippling music.

The female forms her nest on the ground within some depression, which serves to hide and shelter it—often in grainfields. She lays four or five dirty white eggs, blotched and spotted with brown; and she generally produces two broods in a year. These prolific birds live on seeds and insects; they are most abundant in the more open and highest cultivated situations abounding in grain. In winter they assemble in vast flocks, grow very fat, and are taken in great numbers for the table, especially in the Mediterranean region. Consult Boubote, 'Birds of Great Britain' (1907).

SKYROS, ski'rōs, Greece, an island of the Ægean Archipelago, 25 miles northeast of Europolis, and about 100 miles west of the mainland of Asia Minor. It is 18 miles long by seven wide. There is a large mountain at either end, Olympus on the north, 1,207 feet, and then a comparatively level isthmus to Kokhila on the south, 2,608 feet. The higher grounds are densely wooded, but Olympus has fertile slopes. The products are wheat, wine, oil and oranges. The raising of livestock—especially goats—is a considerable industry; also a species of small horses. A Greek monastery occupies the greater part of the modern Skyros. Theseus, the hero of Athens, died here and his bones were carried to that town when under Kimon the Athenians took Skyros. The only town is also named Skyros and its population is about 4,000.

SLADEN, Douglas (BROOK WHEELTON), Anglo-Australian author: b. London, 5 Feb. 1856. He was graduated at Trinity College, Oxford, and became professor of history in the University of Sidney. He traveled extensively in Egypt, Sudan, Japan, China, Australia, Canada, United States and southern Europe. He won the Spencer Cup for rifle shooting in 1874 and collected hunting trophies and curios from all over the world. He made extensive comparative studies in architecture during his travels. Among his numerous published works are 'Frithjof and Ingebjorg' (1882); 'Australian Lyrics' (1882); 'Poetry of Exile' (1883); 'A Summer Christmas' (1884); 'In Cornwall and Across the Sea' (1885); 'Edward the Black Prince' (1886); 'The Spanish Armada' (1888); 'Australian Ballads and Rhymes' (1888); 'A Century of Australian Song' (1889); 'Australian Poets' (1889); 'Lester the Loyalist' (1890); 'Younger Australian Poets' (1891); 'The Japs at Home' (1892); 'On the Cars and Off' (1895); 'A Japanese Marriage' (1895); 'Brittany for Britons' (1896); 'The Admiral' (1898); 'Trincolox' (1898); 'In Sicily' (1901); 'Playing the Game' (1904); 'A Sicilian Marriage' (1905); 'Carthage and Tunis' (1906); 'The Secrets of the Vatican' (1907); 'Egypt and the English' (1908); 'The Tragedy of the Pyramids' (1909); 'Oriental Cairo' (1910); 'The Unholy Estate' (1912); 'The Curse of the Nile' (1913); 'Germany's Great Lie'

(1914); 'Twenty Years of my Life' (1915); 'His German Wife' (1915); 'The Douglas Romance' (1916); 'Grace Lorraine' (1917); 'In Ruhleben' (1917); 'The Shadow of a Great Light' (1917). He has also collaborated with Norman Lorimer, Eustache de Lorey, Mrs. E. N. Humphry, O. M. Potter.

SLAFTER, Edmund Farwell, American historian: b. Norwich, Vt., 30 May 1816. He was graduated from Dartmouth in 1840, took orders in the Episcopal Church and held rectorates in Massachusetts prior to 1877. He is the author of 'Sir William Alexander and American Colonization' (1873); 'Voyages of the Northmen to America' (1877); 'John Checkley, or the Evolution of Religious Tolerance in Massachusetts Bay' (1897); and other historical books and monographs.

SLAG. See METALLURGY; SMELTING.

SLANDER, a false and malicious oral defamation which tends to injure or disgrace the person so defamed. The chief difference between slander and libel is that the latter refers to malicious defamation expressed by writing, printing or illustration. The law draws a wide distinction between the two actions. Words are held to be actionable, whether or not special damages are shown to have accrued from the defamation, if they impute a criminal offense against the law; the having of a contagious disease; or if they are such as would affect one injuriously in his profession or trade. If the words are not so actionable, yet false and malicious, the party aggrieved cannot recover unless able to prove that he has sustained some certain actual loss therefrom. If the party charged with slander prove that the words complained of are true, no action will lie for defamation, whether or not the words are actionable, for in that event the law holds them to be justifiable. Charging one with having committed perjury has always been regarded as being actionable and in many jurisdictions it is so provided by statute. Words which in themselves are not actionable may in reality be so through an allusion to some collateral facts, or through being used and understood in some particular sense and in such cases, when the offensive sense is proved, it is held to be slanderous. Words in themselves slanderous may be accompanied by explanations which deprive them of that character. There are certain kinds of communications which are regarded as privileged and are, therefore, not actionable, as, for example, the statement made in a judicial proceeding, or where one communicates to another a circumstance which he has the right to know relating to a matter of mutual interest; however, this privilege will not justify slander if malice be shown. Slander does not exist if the injurious words are not uttered within the hearing of a third person. Consult Newell, 'Law of Slander and Libel' (1919). See DEFAMATIONS; LIBEL.

SLANG (probably of cognate origin with the Norwegian word *slengja*, meaning "to fling"), a mode of speaking or writing peculiar to some particular place or calling. The slang of the English tongue corresponds to the French *argot* and the German *Säuersprache* or *Rotwelsch*. The word *slang* is itself slang in origin: it has nothing, etymologically considered, to do with any Gipsy word as has some-

times been asserted. Of obscure origin, its form nevertheless suggests a connection with the English word *sling*,—in the sense of this latter word as employed in the phrase *to sling* (that is, *to fling*) "*reproaches*". All colloquial words or phrases which have originated in the rude speech of vagabonds and unlettered classes or belonging in form to the standard speech, which have acquired or have had given them restricted, capricious, or extravagantly metaphorical meanings, and are, therefore, regarded as vulgar or inelegant, may be considered as slang. Among slang names may be mentioned, in general, that class of words and phrases and senses of words and phrases, more or less artificial and affected in origin or use, which are not recognized as belonging to the standard vocabulary of a tongue into which they have been introduced, and have currency in some section of society either as a means of concealing secrets or as intentionally undignified substitutes for those modes of expression employed by persons who have themselves no propriety of speech. Slang is indeed used by persons of every grade of life; it changes with fashion and taste; and sometimes leaves permanent and recognized additions to language. It consists of words which stand out predominantly even in colloquial speech; and the very sense of the word slang implies the conception of a standard language, a normal form of speech, popularly regarded as correct. Slang differs much from dialect, for the latter is a local or provincial form of speech, characterized by some peculiarities of accent, pronunciation or grammatical usage which distinguishes it from standard speech; and a dialect as much may thus have a slang of its own. It is true, however, that slang shades off into the ordinary colloquial speech and is thus constantly supplying the ordinary spoken language with new words and phrases, but this should be no reason why it should be simply confounded with the colloquial. In truth, slang enters more or less into all colloquial speech and into inferior popular literature such as novels, newspapers and political addresses; and is apt to break out even in more careful writing, as witness the criticism of Henry James in his 'Notes on Novelists.' It is noteworthy that most slang is euphemistic. It delights in the invention of synonyms for particular words and devises substitutes for others, which well-bred people for a variety of reasons dislike or hesitate to use. Yet it cannot be said that all slang is of necessity vulgar or ungrammatical. For indeed it is generally correct in accidence and syntax and does not disregard phraseological idiom as to its structure; and thus, while slang not infrequently meets censure as vulgar or unidiomatic, the truth is that it meets with disfavor on other than grammatical grounds. The vogue of any particular slang expression is apt to be very brief; and the constant use of slang tends not only to vulgarize but to limit one's command of language: and here we probably find the reason why it is held in disfavor. Further: slang words are not invented or used because they are in any respect better than accepted phraseology, but because they are *different*. There are two principal characteristics which, taken together, may serve to distinguish what is properly called slang from other varieties of

diction that in some respects resemble it; and these are: Firstly, slang is a conscious offense against some accepted standard of linguistic propriety.

Secondly, slang words are deliberately substituted for words of the vernacular just as the nickname of a person is substituted for that person's name. Nicknames are indeed a kind of slang; and like other slang may be used for the purpose of concealing meaning from the uninitiated hearers.

A mere vulgarity is not slang excepting when it is purposely adopted and in the process acquires an artificial currency among a class of persons to whom it is not native. By "vulgarity" may here be understood such colloquial expressions which are rejected as undignified by speakers of a certain grade in the scale of culture.

Ancient Greek and ancient Latin each had its slang; its argot. See in this connection the plays of Aristophanes, the comedies of Plautus, the satires of Horace, Persius and Juvenal; and especially the surviving, serious fragment of Petronius, known as the 'Satiricon.' Likewise every modern European tongue has its quantum of slang. From the 17th century onward it has been more and more difficult to distinguish between English cant of the thieves and vagrants and slang of other classes more or less characterized by disorderly habits of life, such as pugilists, strolling players, professional gamblers—in brief, of all such classes as are addicted to low pleasures and vices. The specimen of the earliest English "cant" or "Peddler's French" in Copeland's 'The Hyeway to the Spyttel House' (1517) bears characteristics that resemble closely those of the German *Rotwelsch* of the same period. An example of the latter may be found in the Old High German *Liber Vagatorum* of 1510; and it is easily seen that the most noteworthy point of difference between Peddler's French and 16th century Germanic *Rotwelsch* lies in the absence of those Hebrew words from Peddler's French in which *Rotwelsch* abounds. In the English of Hudibras and the literature of England, dating from the 18th century, slang is to be found. A peculiar growth of the 19th century is the so-called back slang, current chiefly among London costermongers, which is a cryptic jargon formed by pronouncing words backward, as in the phrase, "eno dnuop and a flah," for "one pound and a half, thirty shillings." When Sir Walter Scott wrote, the word *slang* itself had apparently no wide currency, and that author felt the need of defining it for his public in one of his works. He seems to have meant what is practically thieves' cant in using the word, but nowadays one should understand by thieves' cant merely one species of an extensive group of expressions called slang. (Consult Scott's 'Redgauntlet'). Costermonger's slang is thieves' slang, in which the middle vowel of a word is taken as the initial letter so the other letters or syllables are added to give it, as it were, a finish; thus, *lock* becomes *ockler* and *pitch*, *itchper*. Slang, and cant, in particular, as in the phrases "thieves' cant" or "printers' slang," or the cant of any craft or calling, really designates a language within a language, and it is sometimes intended to conceal the thoughts of those who utter it from the uninitiated. There is a slang

attached in this way to nearly every profession and occupation; and different classes of society have their slang. Thus there is a slang of commerce, of the army, of the race-track, of the college and school, of the stock exchange, of the prize ring, of the ball field, of politics, and even a slang of art and the ministry. Very often slang adopts technical language to the general use; its expressions may be perfectly correct as originally used, but they become slang when used metaphorically. The gaming-table, the turf and all the varieties of "fast" or "Bohemian" life, each has its own eccentric vocabulary, and these vocabularies are either identical with or in general character resemble the slang of criminal and vagrant classes.

Some examples of slang may now be noted. A user of slang will characterize a feeble-minded or silly person as having a "screw loose," a "slate off," "bats in his belfry," "off his base," or as being "cracked," "touched" or "dotty." He will call his child or wife a "kid." He will say "rum" for "queer," "gay" for "disolute" and call a watch a "ticker." He will say "corned," "pickled," "tight," "stewed" or "slued" for intoxicated; and use "awfully" as substitute for exceedingly. "Daisy" with him will characterize some person who is charming or some thing which is admirable; and the user of slang will announce the death of a person by telling one that someone has "kicked the bucket," "cashed in" or "hopped a twig." To be angry means that he has "got your goat," and he will allude to the clergyman present as a "sky pilot"; while in a museum he will show you the latest "pot-boiler," and in so doing he both names and stigmatizes certain works of art.

A habitual user of slang will likewise borrow words like "pan out" from the technical language of gold digging or other pursuits of a similar character; he will use the word "four-flusher" from the language of the professional poker-player, and he will use the slang expressions "deal," "walk-over" and "up the flume" in giving an account of business. In his vocabulary of praise and blame one will find expressions such as "ripping," "swagger," "stunning," "the cheese," "rot," "poppy-cock"; and when he is in some difficulty he will be "in a hole," "in a box," "on his beam ends" or "in the soup." To extricate himself he will use his head or "nut," "think-box," "brain-pan" or "upper story"; and will need money or, as he calls it, "dough," "mazuma," "shekels" or "rhino." To go in public he will don his "glad rags" and appear as a "swell," "giddy-boy" or "dude." In this respect he will resemble the older "beaux," "bucks," "exquisites," "gallants," "sparks" and "blades." While in the stock exchange one will hear him speak of "bulls," "bears," "lambs," "longs" and "shorts," and from the side of the prize-ring one will find him awaiting to see a "knock-out" and always willing to disapprove of a blow "below the belt"; and he will be disappointed should one of the pugilists "throw up the sponge." One recent contribution to the vocabulary of slang is the word "jazz," which originated in the southern States, and means, according to a user's own definition, "to mix things up and spread 'em on thick"; in other words, a medley. Thus it ap-

pears that nearly every trade and every profession has a slang of its own in the shape of a body of words and expressions that serve as flippant and undignified substitutes for standard speech.

The contribution made by foreign languages to English slang, although it is not to be disregarded, is not to be overrated as to its extent. There are a few words—"boss" from the Dutch *baas*, dago from the Spanish *Diego*, *spiel* and *bum* from the German, which may be named as of foreign origin. The Romany, or tongue of the Gipsy, gave English the words "cove," "jockey," "mug" and "pal," which may be considered as slang expressions, and the English phrases, "not half bad" and "a very decent fellow" are, carefully considered, slang expressions and represent the rhetorical figure called meiosis. There are, it is true, words that are no longer slang ("mob," "humbug" and "tandem" are examples) that were once so considered. America has contributed its quota to the slang of the English tongue; of such we might name the following expressions, recommended mainly by their oddity: "scallywag," "absquatulate," "skeddaddle," "vamoose" (from Sp. *vamos*, "let us go"); and English has also these substitutes for standard usage to characterize political life—"mugwumps," "germy-mander," "carpet-bagger"; as well as the older "Rump," "Bare-bones Parliament," "Round-head," "Puritan," and so on. So politics also has its "slates," "wire-pulling," "pipe-laying," "log-rolling" and "filibustering." Expressions such as the foregoing, stigmatized at first as pure slang, are often in the end accepted as legitimate; just as have been the words "poney," "cob" and the term, "slang" itself.

As the prevailing tendency of words in a language is toward degradation of meaning one of the most frequently recurring needs of English is that of words of dignified and serious intention to take the place of words which have become vulgar through ignoble use; and, therefore, it may be believed that while slang has made its contribution to the English language, still that contribution has been, on the whole, small.

SLATE, a clay rock which has been subjected to compression during mountain-making

processes in the earth's crust, and which as a result splits readily into thin sheets or cleavage laminæ in a direction at right angles to the direction of compression. According to Sorby, cleavage is produced in such rocks by the rearrangement during compression of the plastic particles comprising the original rock mass, in such a manner that their longer axes come to lie perpendicular to the direction of compression, and that planes of easy fracture were thus produced parallel to the long axes of the particles. This was illustrated by Sorby, with a cube of clay through which mica scales or scales of oxide of iron were sprinkled, which was then subjected to powerful compression and drying. A perfect cleavage at right angles to the line of pressure was produced, and microscopic examination showed that the mica scales lay in the direction of cleavage. Tyndall found by experiment that cleavage is more perfect in proportion in which the cleaved material is free from foreign particles, such as mica scales, and he considered that cleavage was produced in homogeneous rocks (except the vitreous) by the compression and flattening of the minute discrete granules or particles of which all such matter consists. The structure is changed by the compression from granulous to scaly. Enormous vertical swelling of the rock masses results through such lateral compression, and this swelling is an important factor in the formation of mountains.

Ordinarily cleavage exists in rocks in a potential manner only—the rock is cleavable in a certain direction, but no actual separation takes place. This, however, is rapidly developed when the rock mass is exposed to atmospheric influences. Slates are quarried in solid blocks and split up in thin sheets, usually by hammer and chisel after quarrying. The important slate-producing horizons of eastern United States are the Cambrian and Ordovician beds of the Taconic range of eastern New York and its extension in Vermont, and the corresponding formations of Pennsylvania and other regions in the northern Appalachians. In composition slates vary greatly, especially in the proportion of silica. An analysis of common roofing-slate gave the following: Silica, 48; alumina, 25.50; oxide of iron, 11.03; potash, 4.70; magnesia, 1.60; carbon, .30; water, 7.60. Since slate is in reality a structural term, denoting the property of easy splitting so characteristic of roofing slates, rocks of almost any composition may be indexed under this term, provided they show the characteristic slaty cleavage. Thus it has become customary to speak of anthracite slate, in which a considerable percentage of carbonaceous material is present; whet slates—clay slates, with a large percentage of silica, often nearly pure silica (Novaculites); talc slates and chlorite slates, where those minerals are prominent; gray-wacke slates, more or less arenaceous and micaceous slates. Roofing slates, however, are the typical slates, and the ones in which the slaty cleavage is best developed. The most important localities for these in the United States are Vermont and Pennsylvania.

The slate belt of Pennsylvania first appears in the eastern corner of York County and "then sweeps around in a gradually narrowing curve to the Susquehanna River." It reappears on the eastern bank of the Susquehanna in Lan-

caster County, but can be traced for a comparatively short distance from the river. While this belt is quite limited in extent, being but six miles long and less than one mile in width, it is nevertheless producing a very high grade product. It is from this belt that the well-known "Peach Bottom Slate" has come. It has remarkable strength and durability, exceedingly fine in grain and texture and the very desirable quality of retaining its original color even after continuous exposure for many years. It lacks the high degree of fissility, however, that characterizes other localities. Microscopic study of thin sections from this belt shows, according to Merrill, that the slate is not fragmental in character, but on the other hand is a "highly carbonaceous, crystalline schist." This is attributed to the high degree of metamorphism to which the belt has been subjected. Bangor and West Bangor are the centres of greatest activity. The belt continues for a short distance into Maryland where a few smaller centres of production are located. Maine follows Vermont with a valuation of \$202,325 for 1901. There are five areas of note in the State. One of the two larger belts extends from Franklin County northeastward to Aroostook County, thence northward into New Brunswick. The second passes from the western boundary of Somerset County, in an easterly direction to Houlton, Aroostook County. "Of the three smaller areas, one is on the Kennebec River, south of Skowhegan and the two others in Washington County, about Baskahegan Lake and near Princeton." Only portions of the two larger areas produce slate of a medium or high grade.

Colorado, Dakota, Massachusetts, Michigan, Minnesota, New Hampshire, Tennessee, South Carolina, Texas and Virginia are known to contain slate terrains of more or less importance. Very little effort, however, has been put forth to develop the slate industry in these respective States.

An inspection of the most recent statistics reveals the fact that there are now some 14 productive States in the Union. Pennsylvania takes the lead, with an annual valuation of \$3,609,957 for the production of 1914. Vermont takes second place with a valuation of \$1,414,247 for 1914. The valuation of the slate production of the following States exceeded \$70,000; these are Maine, Virginia, New York and Maryland. Arkansas, California, Georgia and New Jersey also yield small amounts. In 1914 the valuation of the total production of the United States was \$5,706,787. The latest addition to the list of producers is the State of Arkansas.

Export trade in roofing-slate reached its highest mark in 1898 with a valuation of \$1,370,075. Great Britain was the chief importer of our product at this date. From the above date, however, our exports materially decreased. This was in the main due to the settlement of strikes in the Welsh quarries and the consequent development of the slate industry in Wales. British Australia and Denmark were also importers of the American product. In 1914 exports had dropped to \$139,125.

One of the most remarkable slate belts of this country lies in eastern New York and western Vermont, between the Taconic range

on the east and Lake Champlain and the Hudson on the west, and chiefly between the Hoosic River on the south and the towns of Benson and Hubbardton, in Vermont, on the north. It attains a maximum length of 68 miles and an average width of about seven miles. The great producing centres lie in Washington County, N. Y., and Rutland, Vt.

The slates in this field are green of various shades, purple, variegated, that is, mixed green and purple, red and also black. See SHALE; SEDIMENTARY ROCKS; MINERAL PRODUCTION OF THE UNITED STATES.

A. W. GRABAU,
Columbia University.

SLATER, John Fox, American philanthropist: b. Slatersville, R. I., 4 March 1815; d. Norwich, Conn., 7 May 1884. He inherited from his uncle, Samuel Slater (q.v.), the cotton spinning enterprises which he had founded, and so managed them as to acquire a large fortune. He contributed generously to the establishment and maintenance of the Norwich Free Academy and other similar institutions, but is best known for his gift of \$1,000,000, forming the "Slater Fund," for the education of freedmen in the South. For this benefice Congress voted him a resolution of thanks and a medal. See SLATER FUND.

SLATER, Samuel, American manufacturer: b. Belper, Derbyshire, England, 9 June 1768; d. Webster, Mass., 21 April 1835. He had worked under Arkwright and Strutt in the cotton factories in England and had helped in devising some of the machinery used there, and hearing that a bounty had been offered in the United States for the introduction of the Arkwright patents, he came to this country determined to win it. As the English law forbade the exportation of drawings or models of the English machinery, Slater had to depend entirely on his memory for the mechanical details. He succeeded in constructing at Pawtucket, R. I., the first cotton mill in the United States. He afterward established mills at Oxford (now Webster), and in a locality now known as Slatersville, R. I., where a town of 1,850 people depends mainly on the Slater factory.

SLATER, Mo., city in Saline County, 85 miles northeast of Kansas City, on the Chicago and Alton Railroad. It was settled and incorporated in 1878 and received its city charter in 1884. It is situated in a productive agricultural region and has a flour mill and grain elevator. Pop. 3,238.

SLATER FUND, the gift of John Fox Slater, of Norwich, Conn., to the cause of educating the negroes of the South, was originally the sum of \$1,000,000. The gift was made in 1882, to a board of trustees, who were to hold the principal and expend the interest in promoting institutions already established on a permanent basis. In acknowledgment of this philanthropy Congress voted the donor thanks and a medal. By the terms of the gift neither principal nor income is to be expended on buildings or grounds. The fund is expended principally in helping students of, and preparing teachers for, the manual training schools, agricultural and mechanical colleges and technological institutions. Rutherford B. Hayes, Dr. D. C. Gilman, Morris K. Jessup, Bishop Potter, Wil-

SLAUGHTERHOUSE BYPRODUCTS

- 1 Curled hair Machine. After the hair has been twisted into ropes for curling and processed, it is untwisted, separated and carded by these machines
- 2 Finishing horn hairpins, which have been stamped from horns which have been slit open, heated and flattened out into plates

liam E. Dodge and many other prominent men have served on the board. The fund is as a potential agency in working out the problem of the education of the negro, and \$1,000,000 has already been expended. By the extraordinary fidelity and financial ability of the treasurer, the fund, while keeping up annual appropriations, has increased to \$1,500,000. Schools established by States, denominations and individuals, are helped by annual donations. Among the most prominent are the Hampton Normal and Industrial, the Spelman, the Tuskegee, and schools at Orangeburg, S. C.; Tongaloo, Miss.; Marshall, Tex.; Raleigh, N. C.; New Orleans, the Meharry Medical College at Nashville, etc.

SLATIN PASHA, slä'tên pa-shä (RUDOLF CARL), Austrian soldier: b. Vienna, 1857. In 1874 he undertook a journey to the Sudan, where he made the acquaintance of General Gordon, who, four years later, while Slatin was serving in the Austrian army on the Bosnian frontier, invited the latter to take service with the Egyptian government. In December 1878, at the age of 22, he set out for Khartum. Gordon appointed him successively financial inspector, mudir of Dara, and governor-general of Darfur. In the last-named post he played a prominent fighting part in the struggle against Mahdism. He fought 27 battles, lost a greater part of his Egyptian army and was finally forced to surrender (1884). For 11 years he was a prisoner of the Mahdi and, later, of the Khalifa, being kept in heavy chains most of the time. After his escape he accompanied the British troops in the campaigns of Dongola, the Atbara and Omdurman. He was knighted by Queen Victoria in 1898 and was appointed inspector-general of the Sudan in 1900, a post he resigned in 1914. The British honors conferred upon him include the K.C.M.G., C.V.O., K.C.V.O., G.C.V.O., besides the rank of major-general. These distinctions he renounced in December 1914. His African adventures and long captivity are described in his book, *'Fire and Sword in the Sudan'* (New York 1896). He was a member of the Austrian peace delegation in Paris, May 1919.

SLATINGTON, Pa., borough in Lehigh County, 58 miles northwest of Philadelphia, on the Central of New Jersey, the Lehigh Valley and the Philadelphia and Reading railroads. The scenery is unusually fine, Blue Mountain and Lehigh Gap both being nearby. It was settled in 1738 and was incorporated in 1864. There are slate quarries and manufactures of slate roofing, as well as of machinery, rolling mills products, knit goods and silks. Pop. 4,454.

SLAUGHTER-HOUSE. See ABATTOIR.

SLAUGHTER-HOUSE BY-PRODUCTS. From the viewpoint of the general public, fresh meats are perhaps the most important item in the whole range of commodities which the individual is ever called upon to buy. Yet, from the viewpoint of packers' profits, the by-products of meat packing long ago outstripped dressed beef, pork and mutton, as well as pickled meats of all kinds.

The packer to-day makes little or no money on what are known as carcass meats. In the recent years of struggle with "rising costs" livestock raisers have demanded higher and still

higher prices for cattle, hogs and sheep, not only because the cost of feeds and help have risen, but also on the ground that the quality of their animals, in point of breeding, of finish and tender age of marketing, has constantly improved.

On the other hand, there has been a determined resistance on the part of the consumer to the rising cost of steaks, roasts and chops, as well as constant and widespread agitation throughout the country for higher standards of cleanliness, sanitation and efficiency in methods of dressing, refrigeration and distribution of meats.

Nearly All Profit Eliminated from Dressed Meat.—Efficient and economical operation on a large scale has made it possible for American meat packers to continue in business in spite of increasing cost of livestock, labor, and all material and equipment. They have paid producers the highest prices and have kept their own margin of profit down to the lowest point consistent with safety. Higher standards of meat products have been maintained as a result of United States government inspection.

The producer on the one hand, and the consumer on the other, have each been so jealous of middleman's profits that the middleman, who in this case is the packer, has been forced almost entirely out from a profit viewpoint. In point of service, however, the packer is still in evidence and the slaughter, dressing, chilling and distribution of these dressed meats are still performed by him.

The outcome of such a situation is that the butcher of to-day regularly pays the packer for the dressed carcass a less amount than the packer paid the farmer for the animal before it was killed, dressed, chilled and shipped.

By-Products Pay Packers' Profits.—It will thus be seen that on carcass meats alone the packer loses money, being obliged to maintain, for the distribution of these profitless perishables, an elaborate system of branch houses and refrigerator cars.

This is not to say, however, that the packing business as a whole is devoid of profit. Only approximately 55 per cent of the live weight of a steer is represented in the dressed carcass. In the remaining 45 per cent, which is made up of blood, hide, hoofs, horns, bones, hair, intestines, glands and other items of offal, the packer finds opportunity to recoup himself for any loss he may sustain on carcass meats and ensure a fair return upon his whole investment.

In the early days of the meat packing business all of these items, with the exception of hides, were discarded as of no account. They were, at that time, contemptuously referred to as "the revolting nuisance of packers' waste," which could not be given away, much less sold, and the expense of getting rid of them by other means ate into the profits which then existed in carcass meats.

First Utilization of By-Products.—In the decades since the Civil War, but principally since the introduction of mechanical refrigeration on a large scale, about 1870, a gradual change has been coming over the packing industry in this regard. Small quantities of the bones, ears and hide trimmings began to be utilized in the manufacture of glue at the Chicago stock yards as early as 1869. The value of dried blood as an ingredient of fertilizer

was recognized in 1870. The canning of meats by the Appert vacuum process became commercially successful before 1875, and then the caul or leaf fat about the kidney of steers was found to be especially rich in oleo oil which forms the principal ingredient of oleomargarine to-day.

From that point on, a large volume would be required to enumerate the discoveries and successes wrought by the hundreds of chemists and other scientific and practical men who have devoted years, if not their entire lives, to the exploitation of this promising field.

From Mere Slaughter-Houses to Great Factory Systems.—The gradual development and commercialization of by-products, however, has involved an ever-growing investment in plants, machinery and distribution facilities, and an ever-broadening pay-roll. The business which was once confined to slaughtering and speculating in dry salt and pickled meats, with a small slaughter-house pay-roll in winter only and none whatever for manufacturing and distribution, has grown to be almost wholly an enormous manufacturing industry which occupies itself the year around at utilizing, in commercial form, all those elements formerly comprehended in what was known as packers' waste.

The hides and pelts of steers and sheep, of course, constitute one of the most valuable by-products of the packing business. These are depilated and tanned, usually by the packers themselves, or by auxiliary corporations, and are made into all forms of leather, from shoe soles and belting to the highly finished and brightly colored leathers for book binding and milady's handbag.

Sharp Refrigeration Saves the Perishables.—The hearts, livers, sweetbreads, kidneys, brains and ox tails which, within the memory of men still in active life, were given freely to whoever would take them away, the remainder being dumped regularly into the river or hauled, along with other waste, to the prairie to be buried in trenches, are to-day quickly frozen, packed and transported with the frost on them in summer as well as winter, for retailing at good prices in distant parts of the United States.

Calves' Pates Make Gelatine — Pigs' Feet are Pickled.—Calves' ears are carefully cleaned and manufactured into edible gelatine. Pigs' feet are pickled and sold as a relish. The stomach of the steer is put through an elaborate cleaning, cooking and pickling process and emerges as honey-comb tripe. Much of the blood of the steer, being caught in buckets, is utilized in the making of "blutwurst" or blood pudding. Large quantities, however, are also used as an ammoniate in fertilizer and by tanners in finishing leather. The milts or spleens are mostly sold to the government and other agencies maintaining fish hatcheries as a food for growing fish.

How Oleomargarine is Made.—Great kettles first boil the suet fat and choice leaf fat which are used in the manufacture of oleomargarine. These fats are reduced to liquid form and are sent down pipes to the presses where the oil is separated. Next comes the salting and churning with uncolored butter and pasteurized whole milk. Oleomargarine is known for its purity and nutritive value, as well as the characteristic butter flavor which it possesses.

Oil and Stearin Separated by Pressure.—When the oleo oil has been pressed from the rendered caul fat of the steer, the hard part of the fat remaining in the press is known as oleo stearin. This, also, is the basis of a commercial product which is sold to be used in the manufacture of chewing gum, as well as taffies, penny candies and chocolates.

The coarser and inedible grades of stearin are sold to tanners who use it as a filler in making leather. Inedible grades of lard are pressed to separate the lard oil from the lard stearin. This oil is used in the compounding of lubricating oils.

How Intestines are Utilized.—The intestines of cattle, hogs and sheep are as rigidly classified, graded and devoted to their special purposes as are all other portions of the animal.

A set of hog intestines, for instance, is classified into the small casing, the bung and the middle gut or chitterling. All intestines are flushed with water and thoroughly cleaned and sterilized inside and out. They are next inflated, assorted according to size, and, if used for sausage casings, are salted down in tiers and kept in cold storage as a regular commodity of trade.

Make Sausage Casings and Violin Strings.—The wide range in size, shape and appearance of casings when filled with sausage is bewildering to the uninitiated, yet the variety is not as great as the range of sausages to be contained in them. Every country on the globe, perhaps, has its peculiar styles and grades of sausage, beef and pork, fresh and dried, smoked and unsmoked, cooked and raw, seasoned and unseasoned, and so on, *ad infinitum*. Each of these styles of sausage is quite distinct and necessary to the nationality for whom it is designed, and the myriad sizes, shapes and appearances of casings, when filled, are indispensable as an identification of the exact style of sausage which they contain.

Dried bladders are used as containers for putty and certain other dried tissues as gold-beaters' skins, snuff containers, covers for perfume bottles and as tissue from which balloon envelopes are made.

From the intestines of the sheep many varieties of the best violin and other musical strings are made, the traditional cat gut being a misnomer. Strings for various other purposes are also made, including tennis strings, drum snares, clock cords and surgical ligature.

Novelties Made from Horns, Hoofs and Bones.—The horns and hoofs of cattle are softened by steam, split open and flattened out into plates. From these plates are stamped combs, hairpins, napkin rings, buttons, buckles, knife handles, umbrella handles and other novelties. Black hoofs are also ground up and used as an ammoniate in the manufacture of fertilizer for the use of florists, grape growers and others. The shin bones of cattle are sawed into plates from which pipe bits, buttons, washers, electrical bushings, crochet hooks, chessmen and such articles are made. Soft bones, as well as hide trimmings and sinews, are rich in glue and are devoted to that purpose, the residue being found valuable in the manufacture of fertilizers. The feet of calves and cattle also yield an article commercially known as neatsfoot oil.

SLAUGHTERHOUSE BYPRODUCTS

1 Mechanical mixer working salt into Oleomargarine — the last process preparatory to putting it in cartons
2 Soap in process of seasoning preparatory to cutting up and stamping into cakes

More than 40 Medicinal Agents.—One of the most important and highly scientific departments to be considered in relation to the utilization of abattoir by-products is the pharmaceutical laboratory. In this department, pepsin in both tablet and liquid form is prepared from the stomach linings of the pig, and rennet, for the use of cheesemakers in the curdling of milk, from the true or fourth stomach of the calf. All told more than 40 medicinal agents are manufactured from the various glands and membranes of cattle, sheep and hogs and sold only through the medical profession, among which, in addition to those already mentioned, are pancreatin, thyroids, benzoinated lard, suprarenals, pituitary liquid and ox gall.

Toilet and Laundry Soaps and Glycerin.—The manufacture of soaps however, is perhaps the most familiar example of abattoir by-products in the whole list. Soaps are manufactured in infinite variety and on an enormous scale and Chicago soaps, both laundry and toilet varieties, are attaining a degree of perfection that is marveled at even in France. A by-product of soap making is glycerin, which will be recognized by those who have witnessed the process of soapmaking in their own homes in the clear reddish liquid which remains in the kettle after the solidified soap has been removed. This glycerin, after being refined, is used as a vehicle in medicinal preparations. Its greatest use, however, is in the manufacture of dynamite, nitroglycerin and other explosives.

J. OGDEN ARMOUR.

SLAUGHTER-HOUSE CASES arose out of laws passed in 1869 by the legislature of the State of Louisiana in an act intended to protect the public health in the city of New Orleans and to that end incorporating The Crescent City Live Stock Landing and Slaughter-house Company. The act gives to this company the sole right "to land, keep or slaughter any cattle, beeves, sheep, swine or other animals . . . within the city of New Orleans, or at any point or place . . ." on the east or west banks of the Mississippi River, opposite the corporate limits of the city. Included with this privilege, granted to this company and forbidden to all other persons, was the right to establish wharves for the landing of livestock and to levy wharfage on the stock landed at so much per head. This act was bitterly opposed by the butchers and cattle dealers, and after it went into effect an action was brought in the District Court and an injunction obtained on the ground that the law was unconstitutional; when the case was tried the court sustained the injunction and made it perpetual, on the ground that it was in opposition to the 14th Amendment of the United States Constitution (q.v.), and to the first and second sections of the State "Bill of Rights." In delivering his opinion the judge (Collens) said as follows: "This law (1) prevents any freedom whatever; (2) walls up many miles of the shores of the river on both sides against an important branch of commerce; (3) vests as it were a private company with an ownership in one of the greatest ports of entry in the United States; (4) gives this company alone the authority to 'establish wharves' for vessels bringing livestock into the port of New Orleans; (5) yields it the 'exclusive' right of having one or more stock landings, with the 'exclusive'

privilege of having landed at its wharves and landing places all animals intended for sale or slaughter in the parishes of Orleans and Jefferson; (6) authorizes it to determine at what points or places wharves, stock-landings, etc., may be erected; (7) grants it the power of levying wharfage not simply on the vessels, according to tonnage and time, but a round sum on the vessels, and a duty of 10 cents per head on large, and 5 cents per head on small beasts landed in this port; and (8) all this is made effective by penal clauses imposing fines, etc." The judge declared that this was not only against the clauses named, but, surpassing police regulation, was also "a bold and well contrived regulation of commerce, compelling the coveted trade to flow into the channel, and leave the tribute in the coffers of this private monopoly," and as such was in violation with both the provision in the Federal Constitution giving Congress the sole power to regulate commerce, and the act of Congress under which the State of Louisiana was admitted into the Union.

This decision, with others, some varying, which had been given in different District Courts, were the next year, 1870, carried into the Supreme Court of the State, and there the case was determined in favor of the defendant corporation, and all persons enjoined from interfering with the privileges granted to it under its charter. The opponents of the company then took the case into the United States Circuit Court, asking for a perpetual restraining injunction against it. This was granted on the sole ground that the act incorporating the company was in violation of the 14th Amendment of the Federal Constitution, the court disclaiming jurisdiction over any other of the issues raised. A writ of error was asked for and obtained, and on it the case was carried to the United States Supreme Court. Here, after being three times argued, a decision was delivered in 1873, recognizing the validity of the act and permitting the exercise of the powers conferred by it. The decision of the court on the various issues involved gave the case its great importance. It had been contended, in the first place, that the act was invalid because it created a monopoly, conferring privileges on a few persons to the exclusion of all others, and depriving a numerous class of citizens of the right to follow their usual employment. On this point the court decided that the act was within the police power of the legislature—"a power incapable of any very exact definition or limitation." From the decision upon this point a minority composed of the chief justice and two associate justices dissented. The objection had been urged by the complainants that the act was a violation (1) of the 13th Amendment of the Federal Constitution, by creating a kind of involuntary servitude; and (2) of the 14th Amendment, because it abridged the privileges and immunities of citizens of the United States, deprived the plaintiffs of their property without due process of law and denied them equal protection under the law. The court held that the term "servitude" in the 13th Amendment means personal servitude and that the purpose of the amendment was to guard against a continuance of slavery in any form, and that the amendment had not been violated by the act under discussion. As regarded the 14th Amendment the court perceived and established the difference

between a citizen of the United States and a citizen of a State; it defined the rights and privileges of these two classes of citizens and held that only a citizen of the United States was placed under the protection of the Constitution by the clause in the 14th Amendment. The court further held that no other clause of the amendment was violated, the act of the legislature of Louisiana not being a deprivation of property, nor a denial of the equal protection of the laws, within the meaning of the amendment.

The minority of the court held (1) that the act of the legislature was of itself a step beyond the police powers of the State, and, therefore, was void; (2) that the act was also void under the 14th Amendment since it is in the meaning of that amendment that all acts of a State legislature shall respect the equality of rights of its citizens to follow the ordinary pursuits of life which equality of rights, the minority held, had been contravened.

The decisions of this case are considered extremely important because they not only discuss the police powers of the States, but because of the interpretations of the clauses in the Federal Constitution brought into issue. The case is reported in 16 Wall. 36, Supreme Court reports.

SLAVE COAST, Africa, a name formerly and still sometimes applied to a part of the coast of the Gulf of Guinea, from the mouth of the Niger westward to the river Volta. It is the coast of Togo, Dahomey and part of Nigeria. It received its name from the fact that its ports were the chief centres for the exportation of slaves.

SLAVE LAKE, Great. See **GREAT SLAVE LAKE**.

SLAVE LAKE, Little (or Lesser), Alberta, Canada, a lake in Athabasca Territory, about 270 miles southwest of Lake Athabasca. It is drained by the Lesser Slave River into the Athabasca or Elk River. It is about 60 miles long, and its greatest breadth is about 12 miles. The surface of the lake is 1,890 feet above sea-level.

SLAVERY, an institution, state or condition by which certain persons (slaves) are held as the property of other persons (slaveholders); also the condition of a human being who is held as the property or chattel of another, who is absolute master of his body and service, subjecting him wholly to his will and domination. The system is one of great antiquity and was early practised among the Hebrews. It existed among the Assyrians from the earliest recorded times, among the Babylonians, Chinese, Egyptians and all the ancient peoples. The primitive religions appear to have all sanctioned the institution. Slaves were obtained by capture, purchase and by breeding. They were often controlled by whipping, branding and were at times subject to cruel punishments and death at the whim of their masters. The females were used without their consent, and beautiful girls and women were sold often at public auction. The slaves of the ancient Romans were either captives or debtors who were unable to pay. In Rome the slave had originally no rights. He could be put to death for the smallest misdemeanor. Slaves were exceedingly numerous, and latterly almost monopolized all the various handicrafts and occupations, those of

the clerk, the doctor and the literary man included. In the time of Augustus a single person is said to have left at his death over 4,000 slaves. Hosts of slaves were employed in the gladiatorial exhibitions. Slave revolts occurred in 134 and 102 B.C. in Sicily, and a revolt in Italy led by the gladiator Spartacus in 73 B.C. was put down with considerable difficulty. Slaves, however, were often set at liberty, and these freedmen were a well-known class in Rome. But it was not until the time of the empire that any great change took place in the condition of the slaves. Augustus granted the slave a legal status, and Antoninus took away from the masters the power of life and death over their slaves.

The early Christian Church did nothing to suppress slavery, and slavery and the slave-trade continued to exist for 1,000 years in the Christian nations of Europe that arose on the ruins of the Roman Empire. It was not until the 13th century that the severity of slavery began to decline in Europe. The Koran expressly permits the Moslems to acquire slaves by conquest, but this method of acquiring slaves was not resorted to until the Crusades. Previous to the Crusades they kept negro slaves imported from Africa. Latterly the Mohammedans began to obtain white slaves not only by war but also by purchase, Rome being the centre of the trade. The Mohammedans of the Barbary states also obtained white slaves by piracy in the Mediterranean. The superiority of the white races in war, and the comparative helplessness of African blacks, led to the common practice of invading African coasts and capturing men and women during the 16th, 17th and 18th centuries.

After slavery had become largely reduced in Europe, it had a new birth in the American colonies of European origin. The Portuguese were the first to hunt negroes in the interior of Africa for use as slaves in the colonies. The first shipment of negroes to the New World took place in 1503, when the Portuguese landed some in Santo Domingo. The first shipload of slaves to the United States was landed at Jamestown, Va., in 1619. From that time to the 19th century a traffic in negroes across the Atlantic was carried on by all the Christian colonial powers. Slavery in the British possessions was abolished in 1838, £20,000,000 sterling being paid in compensation to the slaveholders; but it was not abolished in her West Indian colonies until 1839, and in India in 1843. Sweden abolished in 1846, France in 1848, Holland in 1859, Brazil in 1871, Porto Rico in 1873 and Cuba in 1880; African protectorates in 1897 and 1901, the Philippines in 1902. Mohammedan countries and Portuguese dependencies still cling to the institution in 1918.

Slavery must be accepted as one of the stages in the evolution of man toward a recognition of universal freedom. Early man was wholly selfish and sought to dominate. When a war of conquest was undertaken, the scarcity of valuable goods obtained was compensated for by making slaves and menial workers of the men and household drudges and mistresses of the women. It was a phase of the rule of might, but the institution carried with it the seeds of destruction for the conquerors. The morality of the slave-owners and their sons was undermined and destroyed by the possession of

female slaves, and the position of a wife in the family was lowered and debased by the contamination of the domestic circle. A considerable progress in slavery in time ruined a nation, as ancient Rome. Not only was degeneracy encouraged among the masters, but in case of a foreign war dissatisfied slaves at home were a serious menace. But as the majority of human beings have a kind side to their natures, so very many slave masters were generous and liberal in their treatment of their slaves, not only caring for their general prosperity, but arranging their marriages, and assisting their religious worship, permitting them to accumulate private funds, often to buy their own freedom. The Athenians had their publicly owned slaves as well as privately owned, the state often owning those who served public officials or who worked in the temples. In warfare the slaves were used as armor-bearers, workmen, galley-slaves, cooks and sometimes as archers and spearmen. The latter for specially meritorious service in war usually earned their freedom.

There were laws in both Greece and Rome for the protection of the slave, these being gradually developed toward the humane and liberal. In Athens an abused slave could demand to be sold, and he could not be killed at the whim of his master, even if he slew one of the master's family, but had to be tried by a court. Plato condemned slavery altogether, but Aristotle and other ancient savants approved it, believing it beneficial and necessary. In the time of Demosthenes, that orator was moved to speak of the general good treatment of the slaves, and to urge that their enemies would laugh if they knew how happy was the lot of a Grecian slave. While the slaves of Rome did gradually improve their condition and receive better treatment as the centuries rolled on, yet legal measures for their good treatment went much slower than in Greece. The law originally gave the master power of life and death over the slave; he was denied the right to marry. A slave could be examined as a witness only by the torture, because it was held that he would surely lie if not tortured. In Rome many slaves were chained at night, and galley-slaves were nearly always chained to their work. They were sometimes driven under the lash to heavy work, as in the mines and fields. In the later history of Rome, however, the slaves fared better, and very many were placed in conditions that enabled them to earn their freedom. Some masters sought a safe guardian for their children by promising a slave liberty when they were grown. Other masters found that it was financially profitable to encourage their slaves to buy their freedom, since they became industrious and earned so much that by the time their freedom was purchased the master had more than enough money from them to buy another and probably younger slave. In the 2d century the Roman law forbade making eunuchs of slaves, stopped the sale of children into slavery and forbade taking an insolvent debtor as a slave. Under Hadrian the master's power to kill his slave was revoked. Later, under certain conditions the law allowed a slave to bring an action against his master. Justinian punished the rape of a slave as of a free maiden, but he saw no reason for stopping gladiatorial com-

bats between slaves and wild beasts. During the centuries following the fall of Rome the slavery system of Europe gradually merged into serfdom. See UNITED STATES, SLAVERY IN THE.

SLAVERY IN THE UNITED STATES.

SLAVIC LANGUAGES. The Slavic languages form a separate group of the Indo-European languages and are more nearly related to the Lettish, Lithuanian and Prussian, with which they are frequently mentioned as the Balto-Slavic languages. Their original habitat before the period of migration in the 4th century and the original tongue from which they have sprung are still a subject of speculation. The origin of the word "Slav" which first makes its appearance among Syrian and Byzantine writers some time before the 9th century is equally undetermined. It certainly is not to be derived from *slava*, "fame" nor from *slovo*, "word," as assumed by some Slavic scholars, but must, with greater probability, be connected with the Low Latin *sclavus*, "slave," since Spanish Goths and Arabs received the great bulk of their slaves and eunuchs from Russia, and "eunuch" is in Late Greek *Kolobos*, *asklabos*.

The first Slavic tongue to be fixed by writing was the one adopted in the 9th century by the proto-apostles Cyril and Methodius, of the neighborhood of Saloniki, in their missionary work in Pannonia and Moravia, but it is still an unsettled question whether this original speech was Bulgarian or of the Moravian variety, hence the multiplicity of names for it, such as "Old Bulgarian, Old Slovenian, Pannonian." From the fact that it became the liturgical language for all those Slavs who received their Christianity from Constantinople it is also called "Church Slavic." It contains a considerable number of Germanic words and an exceedingly large number of Greek words in its vocabulary, especially such as refer to religious matters. In grammatical structure it is more primitive than any other Slavic language preserved to us, for it has an aorist in the verb and a dual both in the noun and the verb, and the earliest documents which have come down to us show unmistakably the presence of nasal sounds, now quite lost in all but the Polish and an occasional Bulgarian dialect. On account of these ancient characteristics, Church Slavic is put at the basis of Slavic philology, but it would be a mistake to assume that this Church Slavic is the primitive tongue from which the other Slavic languages are derived. (For the further history of Church Slavic see RUSSIAN LANGUAGE).

The Russian literary tongue contains a greater proportion of Church Slavic elements than any other related language, which is the result of the important part the Church Slavic played in Russia as a means for literary expression. The history of the Russian language in modern times is treated separately, but here must be mentioned the fate of the Ruthenian or Little Russian, especially since through the separation of the Ukraine it is likely to gain new importance. It is a distinct group of the Russian dialects, which in the 18th century received literary polish under Kotlyarevski, and since produced the great poet Shevchenko

and the storywriter Kvitka-Ovsyanenko. In the 19th century its literary activity was carried away from the Ukraine, where it had its origin, to Galicia, where at the universities of Lemberg and Czernowitz it was permitted to develop freely. But here it fell under German and Polish influence and almost led to the formation of a separate language, inaccessible to the Ukrainians, who drew similarly upon the Russian dictionary for its new formations. The Ruthenian papers in the United States, nearly all of them of Ukrainian origin, write in a curious mixture of Great and Little Russian. Now the formation of the Ukraine may change the aspect of the literary Ruthenian once more. The modern Bulgarian is phonetically very close to the Church Slavic, but grammatically it has departed from it more than any other Slavic language. It has lost practically all declensional forms and thus stands to the others in very much the same relation that English bears to the other Germanic tongues. The oldest document of the Bulgarian vernacular does not go beyond the 14th century, but it was only in the forties of last century that the first grammar of the spoken tongue was written down by an American, Elias Riggs, after which it was used, at first almost exclusively by American missionaries, in the translation of textbooks. Since then it has fallen, for its vocabulary and style, under the influence of the Russian literature.

The Serbo-Croatian language consists of three dialect groups which are distinguished by the word used for "what?" which is respectively *što*, *cha* and *kay*. The first, considered to be the most elegant, is found in Serbia, Bosnia, Herzegovina and the Litoral; the second is spoken in northern Dalmatia, on the islands, in Sofia and the adjoining territory of Croatia; while the third is the vernacular of north-western Croatia. The Greek Catholic Serbians used in the Middle Ages the Church Slavic for literary purposes, but this Church Slavic was permeated by Serbian exactly as it was Russianized in Russia. Only at the end of the 15th century was the spoken dialect of Ragusa and the Litoral used for literary works, and under the influence of the Italian it reached in the 16th century its highest development and that period is known as the golden age of Serbo-Croatian literature. In the 16th and 17th centuries, the *kay* dialect of Croatia gained predominance. The literary form of the language remained unsettled until the thirties of the 19th century, when Gaj put the *što* dialect of Ragusa at the base of his diction and called it Illyric, in order not to offend any one by the choice of a local name. Meanwhile the Serbian, Vuk Karadzich, had been using the spoken Serbian in his writings. At the present time the Serbo-Croatian is divided into the Croatian of the Roman Catholics, written with Latin characters, and the Serbian of the Greek Catholics, written in a variety of the Russian alphabet. The two literary norms differ in a number of dialectic varieties, but there has been a tendency to bring the two together, at least the Serbian schoolbooks print about one-fourth of Croatian matter, and the Croatians give a similar amount to stories of Serbian authors. The Slovenians of Styria, Carinthia, Carniola and northern Istria, nearly all of them Protestants, have

since the 17th century used their variety of the Serbo-Croatian as a separate literary language, and developed a beautiful literary norm, especially in the 19th century under the poet Preschern, out of a dialect of southern Carniola.

Bohemia began to use the spoken language for literary purposes as early as the 12th century, and in the 14th century no other Slavic language could vie with it in wealth of expression. John Hus employed it in his theological discussions, and under the influence of the German church poetry a vast number of hymns were written in Bohemian, especially by the Moravian Brethren. There was also a considerable activity in the poetry of the romantic type, in which it also followed German models. Beginning with the 17th century Bohemian fell into desuetude, but, this time again under the influence of German romanticism, Dobrovsky, the father of Slavic philology, in the beginning of the 19th century resuscitated the older language of the Moravian Brethren and since then it has been used for all literary purposes. Unfortunately Bohemian is in poetry handicapped by its accentuation, because, no matter how long a word may be, its accent, as in the unrelated Hungarian, is always on the first syllable, whereas in Russian, Bulgarian and Serbian it is mobile, but in Serbian there are really four melodic accents, which make the language very harmonious and musical.

In the 19th century the Bohemian dialect of the Slovaks in northern Hungary, for which it is claimed that it is a transitional language between Bohemian and Serbian, evolved a separate literature. The writer was fortunate in procuring in 1901 almost a complete set of this rare and quaint literature, amounting to something like 1,800 numbers, for the Harvard Library.

Slovenian and Slovak appeal to a population of less than 2,000,000 each, which makes their existence precarious. There is, however, another Slavic language, called by the Germans Wendish, and in philology Serbo-Lusatian, spoken in Lusatia by but a few hundred thousand people and yet divided into two distinct literatures differing somewhat in their literary norms, that of the Catholics of upper Lusatia and of the Protestants of lower Lusatia. After the Russian, the Polish is the best-developed literary language of the Slavs. It made its appearance in the 14th century, when it fell under Bohemian influence. Like the Bohemian, and unlike the other Slavic languages, Polish appears fixed in form from the beginning. In its vocalism it resembles French on account of its nasal sounds, and Italian on account of its soft consonantal utterance. Many of the consonants have four shades, which demand the addition of two diacritical marks and the use of *z* in connection with the Latin alphabet employed by it. The accent is nearly always on the penult, as in Italian. At first the literary form fell under the influence of French and Italian humanism, which led to the introduction of a very large Latin vocabulary, while the proximity to Germany led to the popular adoption of an exceedingly large number of German words. Polish literature had its golden age in the 17th century but it is only in the 19th century that it developed a rich literature, especially in poetry, that is comparable with those of the

other nations of Europe. The closely allied Kashubian, Slovinzian and Polabian languages of East Prussia and Pomerania have been studied philologically, but they have not risen to literary forms. See articles on the languages of this group—Polish, Russian, etc.

Bibliography.—The leading philological periodical for the study of the Slavic languages in general is Jagić's *Archiv für slavische Philologie*, and of late the whole subject of Slavic philology has been treated in the still unfinished work on Slavic philology by Jagić in the Russian language. The 'Comparative Dictionary of the Slavic Languages' by Miklosich is not satisfactory, and his large 'Comparative Grammar' is now superseded by Vondrák's work. For the study of Church Slavic we fall back on Leskien and Vondrák, but the historical evolution of Church Slavic still needs an investigation. A large number of Russian monographs deals with various aspects of the Russian dialects. The best dictionaries are those of the Academy, barely begun, and Dal's great 'Dialect Dictionary.' The White Russian has been studied by Karski, and we have for it a good dictionary by Nosovich. The Little Russian has been similarly studied by Potebnya and Ogonovski, and a large number of other authors. The Bulgarian dialects have been lavishly investigated in a government publication of bulky proportions, especially by Miletich and Tsonev, and the Serbo-Croatian language has since the days of the founder of the science, Vuk Karadžić, been elaborately treated by native and foreign scholars, and of late a Croatian dictionary on a truly grand scale has been published by Broz-Iveković. The most accessible dictionary for foreigners is the 'Croatian-German and German-Croatian Dictionary' by Filipović. Similar studies exist for the Slovenian and Janežić's 'Slovenian-German and German-Slovenian Dictionary' will be found very useful for the student. Bohemian was early treated by Dobrovsky. Since then there has appeared the excellent historical grammar by Gebauer and his unfortunately unfinished 'Old-Bohemian Dictionary.' The most useful dictionary for the foreigner is Jungmann's. The Slovak has not yet enjoyed a careful study, but the Lower Lusatian has both an excellent grammar and dictionary by Mucke, while both dialects are accessible in the similar works by Pfuhl. Even the Kashubian, Slovinzian and Polabian have found careful investigators in Lorentz, Schleicher, Mucke, Mikkola and others. A monumental 'Polish-German Dictionary,' by Linde, appeared in the beginning of the 19th century before Grimm had planned his German Dictionary. Within the last few years a still larger dictionary of the literary language and a great dialect dictionary has been published by the Cracow Academy of Sciences. The best historical grammar is that by Kryński.

LEO WIENER,

Professor of Slavic Languages and Literatures,
Harvard University.

SLAVIC MYTHOLOGY. Of Slavic mythology we cannot obtain a distinct picture, owing to very defective traditions among the peoples of Slav race and perhaps still more because of a great scarcity of records. The early history of this whole race is, in fact, shrouded

in darkness, and we do not even definitely know the time of the first arrival of Slavic tribes in Europe. We do know, it is true, that some of them were heard of as early as the 1st or 2d century of the Christian era, but of their manners and customs, their vernacular and, above all, their creed and worship we know next to nothing at that early time. In some regions of Europe they appear to have preceded the Teutons and to have taken possession of the land, while in others they followed Teutonic tribes, such as the Marcomanni in what is now Bohemia, the Vandals on the Baltic, the Goths and Gepidæ after these had started off on their conquering migrations toward the West and South which were at last to end in the destruction of the Roman Empire. So far as indications go, the bulk of the progenitors of the Slavic populations of to-day seem to have reached and in a manner settled on European soil by the 5th and 6th centuries of our era. But in their shifting occupation of districts and lands, but vague recollections of the mythology of their race have remained. Of the Southern Slavs (Serbians, Bulgarians, Croats), the Poles and the Czechs we do not even possess the names of their early gods. Generally speaking, the Slavic creed consisted in a worship of the forces of nature. We find dim reminiscences of a 'heaven-god,' Svarog (the Vedic Varuna), who apparently was acknowledged more or less by all Slavs. We encounter in the scant records a solar deity, Dazhbog, paid honors to by other tribes under the name of Khors. Fire was worshipped as Ogon (Vedic Agni) and the wind-god as Stribog. With the Northeastern Slavs the chief deity was Perūn, the god of thunder and lightning, the Vedic Parjanya, the Teutonic Donar or Thor. The Western Slavs again along the Baltic coast, such as the Obotriti, the Vinds or Wends, etc., paid homage to a god Radegast or Radegost, also named Sviatovit or Svantevit, the three-headed and trebly-gifted god Triglaſſ, of whose images and devotional service detailed descriptions have been given by ancient writers. These Western Slavs, too, had temples and sacrificial altars, as well as priests, but this does not seem to have been the case with the Slavs of the East. Of inferior gods, on the other hand, or semi-divine beings there still linger memories among all Slavs, such as of the Rusalkas and Vilas (Volos, Veles), wood nymphs and spirits haunting the forests, springs, pastures and lakes, of Kupalo and Garilo, fertilizers of the earth, representatives of the summer sun. The Western Slavs first accepted Christianity through the Greek monks Cyril and Methodius. Some writers tell of a species of dualism, of a ceaseless struggle between darkness and light, in which the Slavs put faith. But this legend seems to have been more owing to Christian influences. Of the 'white' and 'black' god, Bjelbog and Czernebog, said to have been believed in by the Slavs inhabiting the tract between Oder and Elbe, we know nothing reliable. But that nearly all Slavs put faith in the field and house spirits, including also the Royeniczas and Soyneczas (goddesses of birth and fate), the Domowyje and Leshiye, the Babayaga of the Russian, is attested sufficiently.

Teheran, Persia.*

SLAVONIA, a former territory of Austria-Hungary which, with Croatia, constituted the provinces of Croatia and Slavonia, forming part of the possessions of the Hungarian crown. It is bounded on the northeast by Hungary, on the south by Bosnia and part of Serbia and on the west by Croatia and has an area of 3,640 square miles, exclusive of that portion of the military frontier lying between Slavonia and Croatia, which may be regarded as falling within its limits. A branch of the Carniolan Alps, entering Slavonia from Croatia on the west, traverses it throughout its whole length, forming the watershed between the Drave on the north and the Save to the south. The forests are very rich and cover the upper mountain sides on whose lower slopes cultivation is actively carried on. The valleys are extremely fertile; but there are large swamps created by the frequent inundations of the river, rendering the climate in parts extremely unhealthy. Agriculture is the most important occupation, the principal products being grain, fruit, flax, hemp and wine, and the leading exports, grain, wine, fruit, cattle, lumber and the celebrated *Slivovitz* brandy, distilled from plums. The inhabitants are chiefly Serbs and profess for the greater part the Roman Catholic and the Greek Orthodox faith. The chief town is Eszek. With Croatia it had a national Landtag or Diet and sent representatives to the Hungarian Parliament. The population of Croatia and Slavonia is about 2,600,000.

As part of Illyricum, Slavonia was acquired by the Romans in the reign of Augustus and was incorporated with the province of Pannonia. From the Byzantines it was wrested in the 5th and 6th centuries by the invading Slavic tribes, from which time dates its close union with the country to the west which came to be known as Croatia. The united state was ruled by princes of the Hungarian royal house till the early part of the 16th century, when Slavonia was overrun by the Turks. They were driven out at the end of the following century and the territory was organized on a military basis for the defense of the Austrian frontier. Part of Slavonia was placed under civil administration in 1745, but the military frontier was not done away with until 1873. The two provinces had autonomy for home affairs, public instruction and justice. At the Yugoslav Convention held in Geneva in November 1918 a national government representing all Yugoslav provinces was constituted and Slavonia became a part of the new state. See JUGOSLAVIA; AUSTRIA-HUNGARY; CROATIA-SLAVONIA.

SLAVONIC ENOCH. See ENOCH, BOOKS OF.

SLAVS, slavz, the general designation for a group of peoples inhabiting eastern and cen-

tral Europe and forming one of the most important branches of the Indo-European family of nations. The name is derived from the native term *Slovenia*, the origin of which is obscure, some connecting it with *slavo*, word, speech, and others with *slava*, glory. In support of the former etymology is the fact that the Slavic term for foreigner is *nientsy*, dumb, marking the differentiation between those whose speech was intelligible to the Slav ear, that is, the Slavs themselves, and those who made use of an incomprehensible tongue. The connection between Slav and slave, though supported by the analogy of *servus* and Serb, is nevertheless merely fanciful. The Slavic group comprises the following nationalities: Russians (including the Great Russians, the Little Russians, or Ruthenians, and the White Russians), Bulgarians, Serbo-Croatians, Slovenians, Czechs (comprising the Bohemians, the Moravians and the Slovaks), Wends or Sorbs (consisting of the inhabitants of Upper and Lower Lusatia, and Poles with the allied Kashubes). The Polabians, a Slavic people formerly living on the Elbe, have been extinct since the middle of the 18th century. The early history of the Slavs is veiled in obscurity, and only an approximate idea as to their original home is to be obtained. In Pliny and Tacitus the name *Venedæ* (whence the modern Wenden) appears as the designation of a group of non-Germanic tribes living to the northeast of the Carpathian Mountains and extending to the shores of the Baltic and the lake country of the Finns. Ptolemy in the 2d century of our era gives a description of the peoples residing between the Vistula and the Don which would undoubtedly tend to connect a part at least of these tribes with the Slav family. Roughly the home of the Slavs in the first centuries of the Christian era may be given as extending from the Vistula and the Carpathians northeastward to the headwaters of the Volga and along that stream to its junction with the Oka, and southeastward to the Bug and Dnieper, comprising thus the southwestern third of the present Russia. South and southeast of the Baltic, however, were the Lithuanians, a non-Slavic people, though nearest to the Slavs of all Indo-European stocks. In the 6th century Procopius and Jordanes speak of two great Slavic nations, the Sclaveni and the Antes, as established on the left bank of the Danube and to the north. From this it would seem that in the 3d or 4th century the Slav peoples began to migrate from their homes southward, and westward, under pressure probably of the Baltic tribes to the north. In the 5th century they took possession of the country between the Vistula and the Elbe, left unoccupied by the southward migration of the Germanic Burgundians, Goths, Suevi, etc. Slav tribes entered Bohemia and Moravia about the same time, while others advanced from beyond the Carpathians and made themselves masters of western Hungary, whence they passed into Styria, Carinthia and Carniola. At the beginning of the 7th century the Slavs on the Danube crossed into Mæsia and overran Thracia and Macedonia. At the same time Serbs and Croats made their homes in the ancient Illyricum and Dalmatia. A second great wave of Slav migration, starting from the original home north of the Carpathians, spread east and north,

pushing the Finns before them. Under Scandinavian rulers these tribes became the nucleus of the Russian nation. Of this wide area of conquest they have lost in the process of time the regions of the Oder and the Elbe, Upper Austria and part of Carinthia and Styria, of all of which they were deprived by the Germans; large parts of Transylvania and Hungary which fell to Rumanians and Magyars; and parts of the regions south of the Danube which later passed to the Greeks and the Turks.

The ancient Slavs were almost exclusively an agricultural people, averse to all war, and living in complete tribal independence under a fully developed patriarchal system which at a later time became blended with a communal form of government. They were the latest of all the European peoples to enter the sphere of modern civilization, their religion and their literature being, as compared with the other nations, of recent date. The eastern branch of the Slavs received its civilization and religion from Byzantium, the western Slavs from Rome. Christianity made rapid headway among them in spite of the fact that they seem to have possessed a well developed nature-cult about which, however, we possess no definite information. Our materials are limited to the names of various deities worshipped among the northern Slavs, while as to the mythology of the southern branches of the race even such data is wanting. Among the gods of the Russian Slavs were Pernu, identified by some with Thór, the northern god of Thunder, Dazbig (the day god), Wolos, Stribog and others. Svintovint or Sviatovit was the great god of the Baltic Slavs (Rügen), and some who maintain that along with their idol-worship the Slavs possessed a belief in a supreme God would assign to Svintovint that rôle. Grimm erects Svintovint, Pernu and a god named Radegast into a trinity with functions corresponding to the classic Jupiter, Vulcan and Mercury respectively. Other deities worshipped by the Slavs were Prava, the god of justice; Rugevit, of war; Triglaw; Lado and Lada, divinities of order and love; Dievana (Diana), goddess of the woods, and Prija, the Scandinavian Freya. Among the Silesian Slavs the principles of light and darkness were typified by the Bielobog and the Chornobog, the white god and the black god. The mythology of the Slavs was rich in deities of a lower order, in nymphs, naiads and mountain sprites, in goddesses of birth and fate, divinities of the hearth and the field, in evil demons and vampires. The forms of the Slavonic deities recall to mind those of India. Svintovint was represented as four-headed, Pernu as four-faced, etc. There is some testimony to a belief entertained by some of the Slavs in the immortality of the soul and a resurrection beyond the grave. Their principal celebrations were the *kobiada*, a feast held at the beginning of the year, when an interchange of presents was customary; the *kupalo*, a feast that took place in honor of the sun at the time of the summer solstice; and the *trizna*, celebrated in honor of the dead. The functions of priest and ruler were combined in the same person.

From available data it is quite a hopeless task to fix, with any degree of certainty, the number of Slavs in Europe. Official statistics — where issued — are not always reliable, and

independent authorities differ widely, even on the question of how many Slav languages there are. It was not until the first quarter of the 19th century that any serious attempt was made to estimate the Slav populations. Schaffarik in 1826 arrived at a total of 55,270,000; in 1842 he made it 78,000,000; basing his calculations on these figures and those of the Russian historian Pypine, Prof. Louis Leger of the Institut de France struck a total of 79,550,000 in 1868. Zarianko's Russian geography (1891) gave a total of 101,724,000, while Schrader's atlas showed only 97,000,000. M. Niederle, a Bohemian authority, estimated 139,000,000 in 1900, and reduced it to 138,500,000 in 1905. In 1907 a distinguished Russian scholar, M. Florinsky, arrived at 147,146,000 and calculated that, the annual birthrate of the Slav race being 1.7 per cent, it would increase by 2,500,000 per year and would in consequence number 186,000,000 in 1915 and 200,000,000 in 1920. Taking such figures as are available, according — in each case — to the last census, we find the Slav population of Russia given as 92,089,733; Austria, 16,959,095; Hungary, 5,380,190; Serbia (subjects only) 2,890,602; Bulgaria, 3,203,810; Montenegro about 500,000; a grand total of 121,023,430. Most of these statistics, however, were compiled in 1910 and do not include the German Poles nor the other Slavs residing in Germany, Rumania, Turkey, Great Britain, etc. Only one census has been taken in Russia — in 1897. During 1913 and 1914 there were 1,079,677 emigrants to the United States from countries in Europe having predominant Slav populations, mainly Russia and Austria-Hungary, while between 1911 and 1915 Canada received 144,792 from those countries, and numbers also went to South America. In the United States alone there are nearly 4,000,000 Poles, over 2,000,000 Czechs and Slovaks, and some 2,000,000 Jugo or Southern Slavs, besides Russians, Serbs, etc. The European War and the Balkan wars of 1912-13 exacted a heavy toll of Slav blood. The great losses of Russia on the battlefields and in the anarchy following the revolution; the casualties among the Slavs of the ill-fated Austro-Hungarian armies; and the practical extermination of Serbia, besides Bulgarian and Montenegrin losses, must inevitably exert a seriously weakening influence upon the Slav race and disturb the value of statistics. These factors should be borne in mind with regard to the following table, collected in 1918:

Russians.....	100,000,000
Little Russians.....	30,000,000
Poles.....	20,000,000
Czechs and Slovaks.....	10,000,000
Slovenes.....	1,300,000
Croats.....	2,500,000
Serbs.....	4,000,000
Bulgars.....	4,500,000
Total.....	172,300,000

Languages.—The Slavic tongues have been the subject of much controversy and varied classification. On this point, as on that of vital statistics, several authorities — themselves Slavs — differ. Josef Dobrovsky, a learned Czech (d. 1829), counted nine living languages and as many Slav nations in 1822; Schaffarik in 1842 found six languages and 13 dialects; Sreznevsky in 1843 discovered nine and Schleicher in 1865 counted eight. Jagitch made it eight in 1898, while Miklositch and Florinsky

(the latter in 1907) came back to nine. According to more recent research, however, considering the numerous separatist tendencies, the number of Slavic languages has been raised from 11 to 14, without reckoning those which are extinct. According to Niederle there are (1) the Russian group, regarded as two nations, the Great Russians and the Little Russians, the latter including the southern Russians, Ukrainians and Ruthenes; (2) the Polish group; (3) the Lusatian-Serb group, divided into High and Low Lusatian; (4) the Czech group in Bohemia and Moravia, from which the Slovaks of Hungary are more or less divided according to political views; (5) the Slovene group, without separatist tendencies; (6) the Serbo-Croatic group, representing Serbs and Croats; and (7) the solid Bulgarian group, homogeneous except for the Macedonian Slavs, of which some lean to the Bulgarians, some to the Serbs, and others who, until 1913, claimed a separate or Macedonian nationality. Another method of grouping is as follows: (1) Bulgarian; (2) Serbo-Croatic; (3) Slovenian (2 and 3 sometimes being given as one group); (4) Russian, including Great Russian, Little Russian and White Russian; (5) Czechish with the closely related Slovak; (6) Sorb or Wendish; and (7) Polish, Bulgarian, Serbo-Croatian and Russian have sometimes been classified into a Southeastern Slav group as against a Western group consisting of all the others. To the latter group should be added the extinct Polabian. The oldest of the Slavic tongues is the old Church Slavic or Old Bulgarian, which is still the ritual language of the Greek Orthodox Church in Russia, Bulgaria and Serbia. The Slavic languages are marked by a richness of vowel sounds and sibilants and a high degree of inflection, which in the noun possesses seven cases, and in the verb, in spite of a restricted number of tenses, a large number of modal and effective auxiliaries rendering possible the finest distinctions of meaning. The so-called Cyrillic alphabet is used in the Russian, Bulgarian and Serbian, but the Old Church Slavic makes use also of the Glagolitic alphabet (q.v.). The Polish, Croatian, Czech, Slovenian and Sorb employ the Roman characters.

Slavic Music.—Sentiment, which forms so prominent a trait in the Slav character, renders the members of that race peculiarly subject to the influence of music. In Russia the origins are found in the folk-songs which were greatly influenced by the music of the Church. In the 17th century western influences entered the country and especially the Italian, which lasted well into the 19th century, when we have the use of a national school with the appearance of Glinka (q.v.). The prevailing characteristic of Russian music, whether classic or popular, is an all pervading tone of melancholy which has found its fullest expression, perhaps, in the works of Tschaiowsky. Polish music, in many respects resembling the Russian, differs from the latter in a greater vivacity of movement and spirit. The Bohemian is the third important national school of Slavic music and one which in recent years has surpassed the Polish in productivity and held its own with the Russian. For the leading names in Russian music see in addition to those already mentioned, DARGOMYZHKEY; BALAKIREV; BORODIN; RIM-

SKY-KORSOKOFF; RUBINSTEIN; ARENSKI; TANEYEFF. For Poland see CHOPIN; MOSZKOWSKI; PADEREWSKI. For Bohemia see SMETANA; DVOŘÁK.

Panslavism.—This name was originally given to the agitation carried on by a great party in Russia with the object of uniting the Slav peoples of Europe under Russian rule or influence. The movement originated about 1830, when the Polish revolution aroused Slavic national consciousness; it received increased strength from the second Polish revolt in 1863. Congresses of Slav representatives from the different European countries were held at Prague in 1848 and Moscow in 1867. Outside of Russia the ideals of Panslavism were favorably received by the Slavs in Bohemia, Silesia and Croatia-Slavonia, where the members of that race felt their national existence threatened by the repressive policy of the government, Austrian, Hungarian or German as the case might be. Panslavism was largely responsible for the outbreak of the Russo-Turkish War of 1877-78, when Russia entered the lists as the champion of the Balkan Slavs who suffered under the tyranny of Turkish rule. Russia defeated the Turks with the assistance of Rumania (non-Slav); Bulgaria, Serbia and Montenegro, Slav nations. Though the Berlin Congress demolished the Treaty of San Stefano, the four nations were made practically independent of Turkey, and Russia became the recognized protector of the Balkan Slavs. It must be added, however, that this "big brotherly" policy was not unconnected with the old Russian ideal of paving the road to Constantinople. Moreover, this Balkan policy of Russia ran counter to the interests of the Austro-Hungarian monarchy, also a great Slav power. This antagonism rendered impossible any rapprochement between Russia and Germany, the latter being Austria's ally. In this may be recognized the seeds of the European War. Nothing short of an absolute renunciation by Russia of her Panslav policy in the Balkans could remove the possibility of an ultimate rupture with Austria. In course of time, Panslavism broke out in a direction that was perhaps not anticipated by Russia. As the Balkan states grew stronger under the stimulus of national consciousness, fostered by the creation of national armies and more or less democratic institutions, they gradually realized their ability to shape their own destinies. While fully willing to accept all the advantages which the protection of Russia offered, they were not prepared to fall under Russian dominion. Stambuloff, in Bulgaria, pursued a strong anti-Russian policy, and the Serbs cast longing eyes upon the vision of an independent Greater Serbia including the Austrian provinces of Bosnia-Herzegovina and their nationals in Macedonia—then still Turkish territory. Not improbably, they also counted on the inclusion of Croatia, Slavonia and the Dalmatian coast line after the long-prophesied break-up of the Austro-Hungarian empire. Bulgaria likewise had designs on Macedonia; Bohemia clamored for her ancient rights as a kingdom, and the Poles sought the restoration of their country, partitioned between Russia, Germany and Austria—an ambition at all times rigorously suppressed by those three powers. Russia stood to

lose comparatively little by an all-round fulfilment of these national aspirations; to Austria-Hungary it meant a dissolution of the monarchy. Hence the general principle may be accepted that Austro-Russian rivalry, plus the conflicting aims of Austria and Serbia, provided fully one-half of the direct causes of the European War, and that Germany contributed the other moiety by utilizing this antagonism to further her own ambitions. The situation was thus summarized by President Wilson on 14 June 1917: "The war was begun by the military masters of Germany, who proved to be also the masters of Austria-Hungary. . . . The demands made by Austria upon Serbia were a mere single step in a plan which compassed Europe and Asia. . . . It contemplated binding together . . . Czechs, Magyars, Croats, Serbs, Rumanians . . . Bohemia . . . the stout little commonwealths of the Balkans. . . . These people do not wish to be united. . . . They ardently desired to direct their own affairs, would be satisfied only by undisputed independence."

By the summer of 1918 the Panslav movement had attained gigantic proportions. Though entirely diverted from its original aims of unification into a revolutionary scheme of independent separatism, based on nationality, no more appropriate title could be applied to it. A powerful impetus to the cause was the official sympathy extended to its representatives in France, America, Italy and Great Britain. On 22 Jan. 1917 President Wilson declared in favor of an autonomous Poland; the Czecho-Slovak and Jugo-Slav agitation in the Austrian Parliament spread throughout the monarchy and was enthusiastically supported by their nationals scattered throughout the allied countries. Already at the beginning of the war thousands of Austrian Slavs—whole regiments—had gone over to the Russians. Large numbers escaped from the country and joined the Allies in France and Italy. On 6 Jan. 1918 a congress of Czech deputies reasserted their claims at Prague; in April a similar gathering was held at Rome; disorders spread throughout Bohemia and other districts of the monarchy leading to a state of siege around Prague and the establishment of martial law among the Slovenes and Slovaks. On 4 May 1918 the Austrian Reichsrat was abruptly closed by the emperor. Anti-German demonstrations were severely suppressed and thousands interned. Barracks and public buildings were set on fire and German newspaper offices sacked. A Slovene regiment mutinied and killed its German officers. Czecho-Slovak regiments fought in the Italian army and in Russia against the Bolsheviks. In New York, Kossovo Day was commemorated on 16 June 1918, attended by thousands of American Slavs.

SLEEP, a state of rest for both body and mind, during which there is partial abeyance of volition and consciousness, with a relaxed condition of the body and a lessened activity of certain of the vital functions. The muscles do less work in the way of voluntary contractions, and there is, therefore, a diminution in this feature of their tonicity; the respirations are less frequent and rhythmical; occasionally there is a long expiratory pause; the output of carbon dioxide is diminished more than the consumption of oxygen; the pulse is less fre-

quent; the secretions are partially suspended, and the pupils of the eyes are contracted. The whole body is in a state of increased vagus tonus, vagotonia.

Sleep is probably due to a rhythmical cycle habit of millions of years of evolution and is chiefly a tropism reaction to light and temperature impressions. It has been biologically developed by reason of its value as a resting period for less active energy transformation. All parts of the body require such rest as sleep affords, and share, directly or indirectly, in its benefits, for functional activity without periods of rest results in an undue destruction of the tissues and an excess of poisonous products. The essence of the sleep state is functional rest and nutritive repair. Though the brain is in repose, it nevertheless is in function during sleep just as much as all the rest of the body. This activity is registered in dream activity, some of which remain in consciousness. Generally, the more the body can be withdrawn from outside influences the more readily is refreshing sleep obtained. Sometimes pain assists to this end. For example, a man is worried with business cares and has not slept well of late. One evening he has a severe toothache which demands his entire attention. As the pain is relieved he drops off into a quiet sleep and forgets his troubles in unconsciousness.

The amount of sleep needed by different persons varies with age and condition. The greater part of infancy is generally passed in slumber, which is more profound than that of adults. In middle life from six to eight hours' sleep a day is necessary, though it is reported of Frederick the Great and Napoleon that they slept but three or four hours daily. Old persons frequently require seven or more hours' sleep, though some live healthfully with but six. Occupation, race, sex, climate and habit have to do with the amount of sleep required. Brain workers, as a class, take less sleep than laborers. Sleep is sounder and longer in cold climates and among northern races. Women usually take more sleep than men. The influence of habit is noticeable when the demand for sleep comes at a definite time, or in the case of those accustomed to sleep amid noisy surroundings, and who cannot readily sleep in a quiet resting-place.

The disorders of sleep may be classified as follows: (1) Absence of sleep—insomnia, vigilance; (2) imperfect or partial sleep—dreams, sleep-drunkenness, or somnolentia, night-terrors and nightmare; (3) perverted or artificial sleep—somnambulism, hypnotism, mesmerism, trance, somnium; (4) excessive or frequent drowsiness and sleep—morbid drowsiness or somnolence, paroxysmal sleep, epileptic sleeping attacks, trance-sleep, carus, cataphora, lethargy—sleeping-sickness of Africa.

The causes of disordered sleep are many, such as brain affections, blood-poisoning, pain, indigestible food, discomfort, produced by undue cold or heat, mental excitement or worry, overfatigue, febrile conditions, sleeping in an uneasy position or with the head too high or too low, too little outdoor exercise, sleeping amid unaccustomed surroundings. The treatment of disturbed sleep sometimes taxes the art of the physician. Mental repose, bodily comfort, a sufficient degree of warmth, a certain amount of fatigue, combined with perfect quietude, are

essential. An evening walk, a cup of hot milk or cocoa, or a weak stimulant just before retiring, massage, counting and verbal repetitions are aids in producing sleep. Hypnotic medicines should be avoided if possible. Brisk exercise in the open air, every day if convenient, to the point of tiring, is a good sleep-producer. Consult Powell, L. P., 'Art of Natural Sleep' (New York 1908); Bruce, H. A., 'Sleep and Sleeplessness' (Boston 1915).

SLEEPER. A heavy timber laid horizontally at the base of a structure, specifically: (1) A cross-beam or tie supporting the rails of a railroad. (2) In shipbuilding, a heavy floor timber in a ship's bottom. (3) In carpentry and building, any heavy horizontal beam on a ground floor.

SLEEPER-SHARK. See SHARKS.

SLEEPING BEAUTY, The, a fairy tale, probably founded on nature's long sleep in winter. The Earth-goddess falls into a deep sleep, from which she is aroused by the prince, the Sun. We may compare Demeter's search for her lost daughter, Proserpine, in the Greek myth; and the sleep of Brynhild, stung to her sleep by the sleep-thorn. 'The Two Brothers,' found in an Egyptian papyrus of the 19th Dynasty—the time of Seti II—contains similar incidents. The spindle whose prick causes the long slumber is a counterpart of the arrow that wounds Achilles, the thorn that pricks Sigurd and the mistletoe fatal to Baldur. In 'Surya Bai' (from 'Old Deccan Days') the mischief is done by the poisoned nail of a demon. In the Greek myth of Orpheus, Eurydice is stung by the serpent. In a Transylvania variant a maiden spins her golden hair in a cavern, from which she is rescued by a man who undergoes an hour of torture for three nights. The awakening by a kiss corresponds to Sigurd's rousing Brynhild by his magic sword.

SLEEPING-SICKNESS, a peculiar disorder, also called sleeping-disease, African lethargy, lethargus, negro lethargy and nelavan, endemic, especially in western Africa. It is apparently infectious, occurs mainly among negroes and is said to be very fatal. Investigations by the English government and by the Liverpool school of tropical medicine show that its prevalence has been exaggerated by the natives, that it has been confounded with other prevailing diseases which have some of the same symptoms but are distinct affections. The natives in their dread of this malady are ready to assert that a person having enlarged glands, headache and a dry skin, and becoming thin and drowsy, has sleeping-sickness. That the disease prevails at times in certain localities, and is generally fatal, is not disputed, though continued and abnormal sleep has not been present in all cases. M. Christy, in July 1902 found an infected area in a strip of coast-line along the shore of Victoria Nyanza over 100 miles in length, and along the margins of all the islands in the British portion of the Victoria Nyanza. Cases of the disease discovered back of this area were infected, he believes, at the shore. Nearly all the cases of sleeping-sickness that he saw were in persons who had lived on low swampy ground or near the water-edge, in huts surrounded by banana-plants or forest growth. Compact villages on dry land

with but little surrounding foliage were not seriously infected.

Various theories as to the cause of the disease have from time to time been broached. It has been supposed to be due to food-intoxication, like pellagra (q.v.), or caused by one of the many animal parasites common in Africa. Disorders of circulation, mental depression, bad and insufficient food, intestinal and blood parasites are predisposing causes. The recent investigations of Bruce, Castellani, Christy, Dutton, Forde and others show that sleeping-sickness is probably caused by a parasite, a species of trypanosoma, which is transmitted from the sick to the healthy by a variety of the tsetse-fly. This parasite enters the blood and the cerebro-spinal fluid, producing, what is called by the recent investigators, human trypanosomiasis, to distinguish it from the trypanosomiasis which affects horses, fish, etc. The species of tsetse-fly in question inhabits the places where sleeping-sickness is prevalent, and Sambon believes that this fly is not only a carrier of trypanosomes, but acts also as an intermediate host; and is troublesome to man at certain seasons.

Autopsy in cases of sleeping-sickness shows chronic meningitis, encephalitis, meningomyelitis and trypanosomes in the cerebro-spinal fluid and blood. The symptoms may be divided into three stages, one indefinite, one of tremor and a third stage of intense weakness. "True sleep is not really a symptom of the disease." There is at first a disinclination to work or move about. This is followed by headache, pains, especially in the chest, dullness, slowness in answering questions, mumbling and a shuffling gait. Then there are tremors of the tongue and hands; glands may be greatly enlarged (but gland-enlargement is common among the natives); the pulse varies from 90 to 130; evening temperature is from 100° to 102° F., with a morning fall of 1°. The patient becomes drowsy, lethargic and very thin and weak, and takes to bed; the temperature falls, coma appears and death occurs from convulsions or starvation. The disease usually lasts from four to eight months. The researches of Ehrlich and others have devised chemical drugs, usually containing arsenic, which have resulted in the killing of the parasite in the body and thus in curing this disease. Consult Stedman, 'Reference Handbook of Medical Sciences' (1917). See SALVARSAN.

SLEEPY HOLLOW, the valley of the Pocantico Creek, half a mile north of Tarrytown, Westchester County, N. Y. It is best known as the scene of Washington Irving's 'Legend of Sleepy Hollow,' in which he so vividly describes the quiet scenery of the valley and the quaint customs of the old Dutch settlers. The Dutch church, built in 1699, and the old mill conspicuous in the 'Legend' are both standing; and in the newer part of the churchyard cemetery is Washington Irving's grave. Near the mill is the old Philipse Mansion. Above the cemetery rises a knoll, which in 1779 was fortified by the Continentals, but was never attacked.

SLEET, snow or hail either mingled with a fine rain or in a partially melted condition before the surface of the earth is reached. Sleet may be produced by the simultaneous precipitation of snow or hail from a superior, and of

rain from an inferior, stratum of the atmosphere. Its formation is usually due, however, to the partial melting of snow or hail in passage through an upper stratum of air above 32° F., and its subsequent refreezing upon traversing a lower stratum whose temperature is below the freezing point.

SLEIGH, a light vehicle on runners usually with shafts or pole for horses, designed for light loads or pleasure travel over frozen snow or ice, or over the bare ground. A heavy vehicle on runners is usually termed a sledge, as the stout traveling carriage mounted on runners, much used in Russia, Canada and other northern countries during winter, instead of wheel-carriages. A very small and light vehicle on runners for hand use is called a sled.

SLEMMER, slēm'ēr, Adam Jacoby, American soldier: b. Montgomery County, Pa., 1828; d. Fort Laramie, Kan., 7 Oct. 1868. He was graduated at West Point in 1850, assigned to the artillery, fought in the campaign against the Seminole Indians in Florida, and in 1851-55 was engaged on frontier duty in California. He was assistant professor of geography and history in 1855 at West Point, and of mathematics in 1856-59. In 1860 he was ordered to Florida and was promoted major in 1861, served for a time as inspector-general of the Department of the Ohio, and in 1862 was attached to General Buell's army. He was appointed brigadier-general of volunteers in 1862 and at the battle of Stone River, 31 Dec. 1862, he was severely wounded, incapacitating him from further active service in the war. He was promoted lieutenant-colonel in 1864, and in 1865 was brevetted colonel and brigadier-general in the regular army for gallantry. He was mustered out of the volunteer service in 1865, and assigned to the command of Fort Laramie, Kan.

SLICER, slī'sēr, Thomas Roberts, American Unitarian clergyman: b. Washington, 16 April 1847; d. 29 May 1916. He was a Methodist minister for 10 years, then entered the Unitarian ministry, and in 1897 was made pastor of the Church of All Souls, New York. He is the author of 'Doctrine of the Unity of God in the First Three Centuries' (1893); 'The Power and Promise of the Liberal Faith' (1900); 'Book of Common Worship'; 'The Great Affirmations of Religion' (1900); 'One World at a Time' (1902); 'The Way to Happiness' (1907); 'From Poet to Premier' (1909). He received the honorary degree of doctor of divinity from Brown University in 1914.

SLICKENSIDES, a miner's term for the striae, furrows, or polished surfaces covering the walls of fissures, and sometimes the surfaces of bed rock. They result from the friction of two portions of rock moving one against the other under great pressure. The occurrence is common, being often found on the walls of faults and joints.

SLIDE-RULE, an instrument for doing various mathematical operations in a mechanical way. It consists of two or more very accurately graduated and numbered pieces of wood or other material, one or more of which slides in a groove in the other. It may be flat or cylindrical. By shifting the movable slide or slides a variety of tedious arithmetical prob-

lems can be conveniently solved. It is almost indispensable to the draftsman and machine designer.

SLIDELL, sli-dēl', John, American politician: b. New York, 1793; d. London, 29 July 1871. He was graduated at Columbia in 1810, studied law, and in 1819 removed to New Orleans. From 1829 to 1833 he served as United States district attorney for Louisiana; was a member of Congress, 1842-45; and in 1845 was appointed Minister to Mexico, but was not received by the Mexican government. In 1853 he entered the United States Senate, but resigned when Louisiana seceded in 1861. In September of that year he was appointed as associate of James M. Mason (q.v.), commissioner of the Confederate States to France. The two commissioners ran the blockade of Charleston, S. C., and sailed from Havana on the English steamer *Trent*. The *Trent* was overhauled 8 November by Capt. Charles Wilkes (q.v.) with the *San Jacinto* of the United States navy. The two commissioners were arrested and held for a while as prisoners at Fort Warren in Boston Harbor. The act of Wilkes was disavowed by the United States upon demand of the British government, and 1 Jan. 1862 the commissioners sailed for England. Slidell's mission which, besides other things, contemplated recognition of the Confederacy by the French government, failed in its object, France refusing to move, either in that matter or in making a commercial convention, without the co-operation of England. He was successful, however, in securing a large loan for the Confederate States. After the war Slidell settled in London. See **TRENT AFFAIR**.

SLIDING, in economics, (1) a scale of prices for manufactured goods, which is regulated by the rise and fall in the price of the raw material. (2) A scale of wages which rises and falls in proportion to the rise or fall in the market value of the goods produced, or some other varying condition.

SLIDING-KEEL. See **CENTRE-BOARD**.

SLIEVEN, slē'vén, **SLIVEN**, or **SLIVNO**, Bulgaria, in Rumelia, 70 miles north of Adrianople, near the famous 'Iron Gate' defile. It is an industrial town; the chief manufactures are homespun cloths, attar of roses and black wine for which it is famous. There is an extensive trade in homespun cloths and some in silk. A government factory for the making of military uniforms is located here. At the annual fair an extensive business is transacted. Pop. about 26,000.

SLIGO, slī'gō, Ireland, (1) capital of County Sligo, on a bay of the same name, 110 miles northwest of Dublin, on the Garvogue River. The chief buildings are a Roman Catholic cathedral, town-hall, lunatic asylum, etc., also an abbey of the 15th century. Its industrial works are corn- and saw-mills and a brewery. The exports are cattle and agricultural produce, especially to Glasgow and Liverpool. Sligo was in early times a walled city with a castle for protection (1242), and its beginning was a Dominican abbey. Nearby is a group of cromlechs. Pop. 10,870.

(2) Sligo is a coast county of Connaught, northwest Ireland, and comprises 707 square miles. The coast bays are numerous, and the

largest are Killala and Sligo Bay. The highest points are Slieve Gamph and the Ox mountains (1,770 feet). Lough's Arrow and Gill are picturesque lakes. The Moy, Owenmore and Garvogue rivers are navigable. Iron is abundant. Agriculture and stock-raising are the chief occupations. Coarse linen and woolens are manufactured. The principal towns are Sligo, Ballina, Ballymote and Tobercurry. In the county are found ancient caverns, raths, cromlechs, an ancient abbey at Ballysadare and a round tower at Drumcliffe. The population declines, being 84,083 in 1901 and 79,045 in 1911.

SLIME MOULD. See FUNGI.

SLING, a pocket with a stout string or cord tied to each end, for holding temporarily a stone or the like, whirling it around rapidly and then discharging it by releasing suddenly one of the cords. It is a very efficient weapon in the hands of an expert, and was a very general instrument of war among the nations of antiquity. The biblical story of David's victory over Goliath with the sling is well-known. The people of the Balearic Islands excelled at the sling and were much employed in the armies of the Romans and Carthaginians. Livy mentions some tribes still more dexterous than these islanders, who discharged stones with so much force that neither buckler nor headpiece could resist them and who hit their mark to a hairbreadth. In the book of Judges (ch. xx) it is recorded that in the town of Gibeah, in the tribe of Benjamin, there were 700 chosen men, left-handed, every one of whom could sling stones at a hair breadth and not miss. They persisted in use up to the 17th century, when they were used to throw hand grenades.

SLINGELANDT, slīn'gēl-lānt, **Pieter Cornelisz van**, Dutch painter: b. Leyden, 20 Oct. 1640; d. there, 7 Nov. 1691. He was a pupil of Gerard Dow and produced portraits and clever genres, generally dealing with subjects relating to the great guilds or to civic life, and notable for life-like expression, true color and atmosphere and suffused with a delightful humor. His principal pictures are 'Children Blowing Bubbles' (in the Uffizi, Florence); 'The Unmusical Puppy'; 'The Violin Player'; and 'The Singing Lesson.'

SLIP, (1) moistened clay prepared for the decoration of pottery and terra cotta. It is usually colored. See POTTERY. (2) A space between piers in which a vessel may lie, as a ferry-slip.

Slippage, in mechanics, the amount or character of a slip. A loose joint in a piston-rod might involve a corresponding slippage of the piston, during which motion it would do no useful work. A propeller cannot push a ship as far in the water as its actual travel would indicate theoretically and the difference is the slippage. Allowance made for play is also called slip or slippage.

SLIPPERY ELM. See ELM.

SLIVEN, slē'vën. See SLIEVEN.

SLIVERING MACHINE, one of a class of machines used in match-making, dividing match-cards, forming veneers, etc. Excelsior and toothpicks are made automatically on slivering machines. For match-making they usually include mechanism for forming the match-heads. For cutting various small wooden

pieces used in joinery, and separating the cards of matches, a gang-saw type of sliverer is employed. In forming strips of veneer, the sheet of veneer is first cut by a stationary knife and then a plunger pushes the veneer down upon the slivering knives.

SLOAN, Charles H., American politician: b. Monticello, Iowa, 2 May 1863. In 1884 he was graduated at the Iowa State Agricultural College; from 1884 to 1887 was superintendent of schools at Fairmont, Neb., was admitted to the bar in 1887; practised at Fairmont from 1887 to 1891, and at Geneva, Neb., after 1891. In 1890-94 he served two terms as attorney of Fillmore County and was a member of the Nebraska senate in 1894-96. From 1911 to 1919 he was a member of Congress from the fourth Nebraska district.

SLOANE, slōn, **SIR HANS**, English naturalist: founder of the British Museum: b. Killileagh, County Down, 16 April 1660; d. Chelsea, 11 Jan. 1753. He studied medicine in London, Paris and Montpellier, and in 1684 settled in London for the practice of his profession. In 1685 he was admitted a Fellow of the Royal Society, of which he was appointed secretary in 1693 and president in 1727. His 'Voyage to the Islands of Madeira, Barbados, Nieves, Saint Christopher's and Jamaica, with the Natural History of the Last' (1707-25) was the result of observations made in the West Indies during his stay as physician to the governor in 1687-89. George I created him a baronet and physician-general to the forces in 1716, and on the accession of George II he was named physician in ordinary to his majesty. See BRITISH MUSEUM.

SLOANE, Rush Richard, American lawyer and capitalist: b. Sandusky, Ohio, 18 Sept. 1828. He early entered political life, was twice elected probate judge, was a delegate to the convention which organized the Republican party in 1856 and a prominent member of various political committees and conventions. He was conspicuous in the abolition movement and was prosecuted by the United States government in 1852 for having defended six runaway slaves, the only person prosecuted for that offense under the Fugitive Slave Act of 1850. He was appointed general agent of the Post Office Department by President Lincoln in 1861, assisted in the organization of the "Cassius M. Clay Brigade" for the protection of Washington in 1861 and served as one of its members. He was mayor of Sandusky 1879-81, built the "Big Four" Railroad between Springfield and Columbus, Ohio, was railroad president for 10 years and largely interested in various commercial enterprises.

SLOANE, Thomas O'Connor, American scientist: b. New York, 24 Nov. 1851. He studied at Columbia and was professor of natural sciences at Seton Hall College, New Jersey. He invented the self-recording photometer, the first instrument to record mechanically the illuminating power of gas; described a new process for determining sulphur in illuminating gas and has lectured on scientific topics. He is the author of 'Home Experiments in Science' (1888); 'Electricity Simplified' (1891); 'Standard Electrical Dictionary' (1892); 'Liquid Air and the Liquefaction of Gases' (1899), etc.

SLOANE, William Milligan, American historian: b. Richmond, Ohio, 12 Nov. 1850. He was graduated at Columbia in 1868, studied at the universities of Berlin and Leipzig in 1872-76, acting during much of that time as private secretary to George Bancroft, then United States Minister to Berlin. He was professor at Princeton in 1876-96, edited the *Princeton Review* in 1886-89 and since 1896 has occupied the Seth Low chair of history at Columbia. He has published 'Life and Work of J. R. W. Sloane' (1888); 'Life of James McCosh' (1892); 'The French War and the Revolution' (1893); 'Life of Napoleon' (4 vols., 1897); 'The French Revolution and Religious Reform' (1901); 'Parteiherrschaft in America' (1913); 'The Balkans' (1914); 'Party Government in America' (1915), etc.

SLOAT, slōt, John Drake, American admiral: b. New York, 1780; d. New Brighton, Staten Island, N. Y., 28 Nov. 1867. He was appointed a midshipman in the navy in 1800 but was mustered out in the following year after the passage of the peace establishment act. At the outbreak of the War of 1812 he re-entered the navy as sailing master of the frigate *United States*, and for gallant conduct in the capture of the British ship *Macedonian* received a silver medal and the thanks of Congress. He was engaged in the expedition for the suppression of the West Indian pirates in 1823-25, holding chief command after 1824, captured the pirates *Palmyra* and *Colfrecinos* and the pirate stronghold Foxhardo in Porto Rico. He was promoted to master-commandant in 1826, captain in 1837 and in 1840-44 was in charge of the Portsmouth navy yard. He commanded the Pacific squadron in 1844-46, had charge of the Norfolk navy yard in 1847-51, and then superintended the construction of the Stevens battery. He was retired in 1861, but received rank as commodore in 1862 and as rear admiral in 1863.

SLOCUM, slō'kūm, Henry Warner, American soldier: b. Delphi, Onondaga County, N. Y., 24 Sept. 1827; d. Brooklyn, N. Y., 14 April 1894. He was graduated at West Point, but resigned his commission and began the practice of law. When the Civil War broke out he was commissioned colonel of volunteers in the Union army. He was at the first battle of Bull Run, was made brigadier-general in 1861 and major-general in 1862. He then commanded a corps of the left wing of Sherman's army, which he led on the "March to the Sea." After the war was over he resigned, resumed the practice of law in Brooklyn and sat in Congress 1869-73.

SLOCUM, Joshua, American navigator: b. Annapolis County, Nova Scotia, 20 Feb. 1844. He engaged in a seafaring life from early boyhood, studied nautical astronomy and marine architecture, and for many years sailed from the coast of California to points in China, Japan, Australia and the Spice Islands. In 1874 he built a steamer of 90 tons register at Olon-gapo, Subig Bay, Luzon, and in 1892 built at Fairhaven, Mass., the *Spray* of nine tons register, in which he sailed alone around the world in 1898. He published serially in leading magazines accounts of his voyages in the *Spray* and in the *Destroyer* and has also written 'Voyages

of the *Liberdale* from Brazil to New York' (1891); 'Voyage of the *Destroyer*' (1894); 'Sailing Alone Around the World,' etc.

SLOCUM, William F., American educator: b. Grafton, Mass., 29 July 1851. He was graduated at Amherst in 1874, and at Andover Theological Seminary in 1878. He held Congregational pastorates at Amesbury, Mass., 1878-83, and Baltimore, Md., 1883-88. He subsequently became president of Colorado College. He has written on sociological subjects.

SLOCUM DISASTER, the burning of the excursion steamboat *General Slocum* on the East River, 15 July 1904, in which about 1,000 lives were lost. The *General Slocum* left her pier in the East River with about 1,800 persons on board, most of them members of Saint Mark's Lutheran Church, New York. She had proceeded but a short distance up the river when fire was discovered on board, and in the panic ensuing, as the flames spread rapidly, many passengers threw themselves overboard and were drowned. Delay in beaching the boat was charged, but it was finally grounded on North Brother Island. Many more lives were lost even than through fire or drowning, owing to the panic which seized crew as well as passengers, and to the fact that the life-preservers were old and worthless. The United States Steamboat Inspection Service placed the number of lives lost at 938, while the New York police estimate was 1,031. Official investigation showed that the steamboat had not been carefully inspected, that the crew was practically untrained for an emergency and that the life-preservers were of absolutely no value through deterioration due to age. The captain, William H. Van Shaick, was in 1906 sentenced by the United States District Court to 10 years' imprisonment on a charge of criminal negligence; but the steamboat company evaded legal responsibility for the tragedy.

SLOE, or BLACKTHORN, a European shrub (*Prunus spinosa*), from two to 15 feet high, much branched and very spiny. The small, white, rosaceous flowers appear before the leaves, which are alternate, ovate with obtuse tips and finely serrate. The fruit is a globose drupe about as large as a cherry, almost black, with a bloom, and containing a stone slightly flattened and acute on one edge. Its variety, the bullace (*P. insititia*), has by some been called a species and is supposed to be one of the plants from which European plums originated. The pits have been found in Swiss lake-dwellings, and the fruits have been used for preserves, for making fictitious port and adulterating the genuine wine and for a black dye. The leaves were an adulterant of tea and the stem furnishes the knobby "blackthorn" stick of Irish fame.

SLOOP. See SHIP.

SLOSSON, Edwin Emery, American editor, educator and author: b. Albany, Kan., 7 June 1865. He was graduated at the University of Kansas in 1890 and took his Ph.D. at the University of Chicago in 1902. He was professor of chemistry at the University of Wyoming in 1891-1903, serving also as chemist of the Wyoming Agricultural Experiment Station. From 1903 he was literary editor of the *Independent*, New York, of which he was also at various times managing editor. In 1912-14 he

was associate on the faculty of the Columbia University school of journalism. He is a contributor of literary and scientific articles to magazines and is author of 'Great American Universities' (1910); 'Major Prophets of Today' (1914); 'Six Major Prophets' (1917), etc.

SLOTH, an edentate mammal of the family *Bradypodidae*. (See **EDENTATA**). The best known are the unau or two-toed sloth (*Choloepus didactylus*) of Brazil and the ai or three-toed sloth (*Bradypus tridactylus*) of northern South America. This family is distinguished by the flat short head, and the elongated legs, furnished with powerful compressed and curved claws. No incisor teeth exist, but simple columnar molars without enamel are developed. The stomach is somewhat complex. The three-toed species are unique among mammals in possessing nine cervical vertebrae. The long bones are solid, and destitute of marrow or medullary cavities. Being adapted solely for an arboreal life, the fore-limbs exhibit a much greater length than the hind-limbs, and a powerful muscular organization. The forearm possesses an unusual degree of mobility, the feet being strong and the claws very powerful and permanently flexed. The usual mode of progression of these animals is to move back downward suspended from the branches of trees, and they are known to sleep in this curious position. On the ground the sloths are entirely out of their element; the feet being jointed in an oblique manner to the limbs, the palms and soles are thus naturally turned inward, and the claws themselves are bent inward toward the soles of the feet. Three toes exist in this species, and its general color is a brownish gray, with darker tints on the face and limbs. The fur is of very coarse character, and when the animals are living in their damp native forests is tinted green from the presence upon it of a minute green plant or alga. The unau, as its specific name implies, has but two toes, and 23 pairs of ribs exist, no mammal possessing a greater number than this. Its average length is about two feet, and its color is a lighter gray than that of the ai. The tail in both species is either wanting, or at the most is rudimentary. The sloths are proverbially sluggish in their movements and are remarkably tenacious of life. They are nocturnal and feed upon leaves and shoots which are secured with the slender prehensile tongue. Generally only the two genera mentioned above are recognized, but by some zoologists the three-toed sloths are subdivided. The number of species is also doubtful. About 15 have been described, all confined to South and Central America. The Megathium and Mylodon (q.v.) were gigantic sloth-like terrestrial mammals, the remains of which are found abundantly in the Pleistocene deposits of North and South America. Consult Flower and Lydekker, 'Mammals Living and Extinct' (London 1891); Leidy, 'Extinct Sloth Tribe of North America' (Washington 1855); Bates, H. W., 'Naturalist on the Amazon' (1910).

SLOTH-BEAR, or **ASWAIL**. See **BEARS**.

SLOTH-LEMUR, or **SLOW LEMUR**. See **LEMURS**.

SLOUGH GRASS. See **FIBRE**.

SLOVAKS, *slō-vāks'*, the name of the Slavic inhabitants of northern Hungary. They are the descendants of the Slavs who settled on the south of the Carpathians between the Danube and the Theiss, where they maintained themselves for centuries, and in the 9th century formed the nucleus of the great Moravian empire. After the battle of Pressburg, in 907, in which this empire was overthrown by the Magyars, the Slovaks gradually fell under the yoke of the conquerors. At the present day they are scattered over most of the counties of Hungary, and in the northwestern counties they form the majority of the inhabitants. They are also found in Moravia in the districts adjoining Hungary, and in detached settlements in Lower Austria, Bukowina and Slavonia. The Slovaks possess in their own dialect a number of beautiful popular songs, collections of which have been published at different times (Pest 1823-27; Buda 1834). There is a grammar of the language by Victorin (Budapest 1878). The total number of Slovaks is about 2,500,000. Consult Copek, J., 'The Slovaks' (New York 1906); Seton-Watson, 'Racial Problems in Hungary' (London 1909). See **SLAVS**.

SLOVENES, *slō-vēnes'*, a Slavonic people often confused with the Slovaks. Most of them are to be found in the Austrian provinces of Carinthia and Styria, although there are a few in Italy and Southwestern Hungary. They came from farther east about the 7th century, and were chiefly Christianized. They possessed a Bible and grammar in their own language, but during religious differences in the 16th century these were mostly destroyed. They are now mainly Runich in their faith. Their language is split into eight dialects. They have a lyceum at Laibach containing a choice collection of Slovene books. They number about 1,300,000. Consult Strekelj, 'Slovenske Narodne Pesmi' (Laibach 1895).

SLOVENIANS, or **SLOVENES**, the native name of the Slavic inhabitants of Styria, Carinthia, Carniola, the Austrian maritime territory, a narrow strip in the west of Hungary and in Venetian Friuli. By the Germans they are often called Wends or Winds. They settled in these districts toward the end of the 6th century, having migrated there from Pannonia. Christianity was introduced among them not later than the 8th century. Their land was incorporated under the name of the Windic March with the empire of Charlemagne. Out of this march were afterward formed the duchies of Styria, Carinthia and Carniola, which fell to Germany and ultimately to Austria. Their total number is about 1,300,000. The language of the Slovenians is closely allied to the Servian. (See **SLAVS**). It possesses some very old and valuable monuments of the Slavonic tongue. The oldest, which is at the same time the most ancient of all the Slavonic literary relics, is the Munich manuscript, of the date 957-994, written by Bishop Abraham, of Freising, in Bavaria, and consisting of three articles on religious subjects. It is printed in Kopitar's 'Glagolitza Clozianus' (Vienna 1836). After a long slumber the dialect was resuscitated for literary purposes in the 16th century, when several ecclesiastics brought it to a high state of development. In 1584 Bohoricz published a grammar of the language, and in the

same year there appeared a translation of the whole Bible. The best grammar is that of Kopitar (Laibach 1808). A dictionary by Jarnik and Mark was published in 1832, and collections of popular songs were published by Wraz and by Korytko in 1839. See SLAVS.

SLOW-WORM, or **BLIND-WORM**, a limbless, snake-like lizard (*Anguis fragilis*) of Europe which creeps about beneath dead leaves, in rotting logs, etc., in search of insects. It is 15 to 20 inches in length, smoothly scaly, brown striped and perfectly harmless.

SLOWACKI, slō-vă'kē, **Julius**, Polish poet: b. Kremenecz, in Volhynia, 23 Aug. 1809; d. Paris, 3 April 1849. He was educated in the University of Vilna. His first work was the poetic tale 'Hugo'; this was followed by the tragedy 'Mindowe' (1829); the poem 'Mnich' (the 'Monk'); and the tragedy 'Marya Stuart' (1830); in all of which he was under the influence of Byron; but escapes from it in the 'Ode to Liberty'; 'Hymn to the Mother of God'; and 'Song of the Lithuanian Legion' (1831). The sentiment of Polish nationality finds fullest expression in the dramatic poem 'Kordyan' (1834), and in the tragedy 'Mazepa.' Slowacki reaches the height of his lyric power in the poem 'In Switzerland.' His last great work, left incomplete, was 'King Spirit,' which he designed to be a "legend of the ages" of Polish history. See KORDYAN.

SLOYD. See **MANUAL TRAINING**.

SLUGS. See **SNAILS AND SLUGS**.

SLUICE, in *hydraulics*, any artificial channels of small dimensions, as a frame of timber, stone or concrete, serving to retain and direct the water of a canal, dam, etc., and often to give it vent; also called sluiceway. Hence, an opening; a source of supply; that from which any thing flows; as, the eyes are the lachrymal sluices of sensibility. The form used in placer mining is a long wooden trough, with longitudinal cleats in the bottom and occasional cross-cleats. Quicksilver being placed in the cleats tends to hold any gold in the dirt that is washed through the sluice.

SMACK, a small vessel rigged as a cutter, sloop or yawl, used in the coasting trade and in fishing.

SMALCALD, smāl'kâld, or **SCHMAL-KALDEN**, shmāl'kâl'dēn, Prussia, a town in the district of Cassel, on the south slope of the Thüringer Wald, 35 miles south of Muhlhausen. It contains a Gothic church built in the 15th century and the Wilhelmsburg Castle, in which there is a collection of antiquities. In the old town-hall the Smalcaldic League was concluded in 1530 and the Smalcaldic Articles signed in 1537 by the Protestant leaders. The town has several institutions for higher education, and a trade-school for the iron and steel industry is the most important. Pop. 9,529.

SMALKALDIC LEAGUE. See **SCHMAL-KALDIC LEAGUE**.

SMALL, John Kunkel, American botanist: b. Harrisburg, Pa., 31 Jan. 1869. He was graduated at Franklin and Marshall College in 1892 and took his Ph.D. at Columbia in 1895. He was curator of the herbarium at Columbia University in 1895-99, and at the New York Botanical Garden in 1899-1906, since when he

has been head curator there. Author of 'Shrubs of Florida' (1913); 'Flora of the Florida Keys' (1913); 'Flora of the South Eastern United States' (1913), etc.

SMALL ARMS. Included under this title are the various types of firearms that from their portable form may be classed as hand weapons, as distinguished from ordnance. In their earliest forms, small arms do not differ from cannon except in size. These weapons, dating from the 14th century, were suspended from the neck of the trooper. This cavalry weapon, known as the bombardello, was succeeded by the hand culverin, mounted on a wooden stock, and fired from a rest by a slowmatch. It took two men to fire it and, except for the terror caused by its noise, was a far less effective weapon than the crossbow. The stock and barrel gradually took on a form not unlike the present one, and the slowmatch was fastened to a serpentine or cock on the piece. This was manipulated by a lever or spring, and transferred the fire from a match on the barrel to a flashpan containing powder and situated just under the touchhole. This piece, known as the matchlock, was partly superseded in 1515 by the wheellock, in which the trigger released a clockwork which rotated a grooved metal wheel against a piece of pyrites or flint, thus igniting the priming. The wheellock was too expensive for military purposes, and was confined to fowling pieces, which it first made reasonably convenient.

The flintlock originated in Spain about 1600, though it did not come into general military use till nearly a century later. The priming was ignited by the contact between a flint held in a frame not unlike the serpentine of the matchlock and the cover of the flashpan. The flintlock was the prevailing arm as late as 1840. It was almost invariably muzzleloading, as assumed the forms of pistol, smooth bore musket and rifle. The rifle dates back almost to the beginning of the history of firearms, and is characterized by helical grooving on the inside of the barrel. This secures against the escape of gas past the bullet, and gives a predetermined axis of spin to the bullet, thus increasing the accuracy of fire.

In 1807 a Scotch clergyman by the name of Forsyth patented the use of fulminates for the ignition of the charge in firearms. This gradually came to be adopted in place of the flintlock. The mechanism was much like that of the flintlock: the flint was replaced by a metal hammer, and the flashpan and touchhole by a nipple containing a metal cap of fulminate. The reinvention of the breechloader (for the breechloader in a primitive form is as old as the gun itself) took place soon afterward. The first military rifle was the needlegun of the Prussians, invented by Dreyse in 1839. It was a crude bolt action weapon with very imperfect obturation, as a paper cartridge was used. The French soon followed suit, first with the Tabatière and then with the Chassepot. In 1866 the British adopted the Snider rifle, remodeled from the old Enfield. The Martini falling-block rifle was adopted in 1871. In 1872 the Mauser boltaction rifle was made the arm of the German army. This gun is the type of most modern military rifles.

During this period, the ammunition under-

went improvement along with the gun. The round bullet was replaced by one cylindroconical in shape, and the cartridge case of paper gave way to one, first of coiled brass, and then of drawn brass. This made escape of gas impossible and solved the problems which had vexed the inventors of breechloading arms from the 15th century on. The magazine principal gradually came into use—first in the form of a tube magazine now retained only by the French Lebel—then of a box under the action and finally of a box loaded with five or six cartridges at once by a clip or charger. The calibre was then reduced to the neighborhood of .3 inches or less, and a muzzle velocity of over 1,800 feet per second was attained. This was made possible by the invention of the copper-jacketed, non-stripping bullet by Major Rubin of the Swiss army. Soon afterward smokeless powder was introduced, and the military rifle had assumed practically all its present features. The Krag-Jorgensen and Springfield mentioned below are typical military arms.

For many years after the arrival of the early colonists, imported weapons were used in America almost exclusively. On the Continent, especially among the Germans, Swiss and French, much attention had been given to the production of arms of precision and greater progress had been made than in England. The Puritan settlers in New England remained satisfied with their matchlock and flintlock smooth-bore arms until the Revolutionary period. Their traditions and training were such that the use of deadly weapons, excepting in cases of defense from enemies and for the purpose of obtaining game in order to sustain life, was frowned on as a practice to be discouraged.

It is to the Teutonic settlers of Pennsylvania that we must turn for the earliest examples of typical American weapons. Peter and Heinrich Leman established themselves near Lancaster, Pa., at the beginning of the 18th century and in 1732 were making rifled arms.

Naturally the first rifles produced were of the contemporary German model, short-barreled, ungainly pieces of large bore. They were flintlock, loading from the muzzle, a mallet being necessary in order to start the bullet into the deeply cut rifling, considerable pressure being afterward required in order to seat the bullet down upon the powder charge. The frontiersmen appreciated the value of an arm that gave the accuracy of which these weapons were capable as compared with smooth-bore muskets.

But such laborious methods of loading were impracticable under conditions of Indian warfare and in the pursuit of dangerous game. So the linen or buckskin patch, impregnated with tallow, was devised to be wrapped about the bullet when loading. This seated readily and the rifles were found to shoot farther and truer than by the previous method. By lengthening the barrel greater accuracy as well as ease of sighting and steadier holding ensued. The barrel was usually from 40 to 45 inches in length, octagonal, and of a bore from 35 to 40 round balls to the pound. The stock was made of maple or walnut extending the full length of the barrel, the ramrod being carried in a slot underneath. A cheekpiece was fashioned near the breech, also a patch box, and the butt of

the stock terminated in a crescent-shaped plate to be held against the upper arm instead of the shoulder. The locks were generally fitted with single or double set triggers. The stock was intentionally slender and light, the total weight of the rifles being about 10 pounds. Sights were very low on the barrel, consisting of an oval silver blade at the muzzle and at the breech a straight bar with a fine notch, frequently inlaid with a narrow vertical strip of silver. Though the range of these rifles was seldom effective beyond 200 yards, within that distance great precision as well as a flat curve of trajectory was secured, the proportion of the weight of the bullet to the powder charge being about three to one.

In the Far West a change in model was made in order to adapt the rifle to the conditions of buffalo hunting and use on horseback. A rifle of this type made in Missouri in 1820 has a 34-inch octagonal barrel with a maple stock extending half way to the muzzle. The bore is slightly over one-half inch in diameter, and a charge of about 90 grains of powder was used. This arm has double set triggers and weighs about 10½ pounds.

In the South the standard rifle was of relatively small bore. Bullets of about 70 to 80 to the pound were found to be sufficient for still hunting the small game of the section, such as wild turkeys and squirrels. Though larger calibres were to be found to a certain extent, the Kentucky smallbore rifle attained a widespread reputation.

The sport of target or turkey shooting from an artificial rest at distances up to 40 rods developed a type of rifle which while very accurate was useless for field purposes, weighing from 20 to 40 pounds. A bore of from .40 to .60 calibre was customary with an elongated projectile and telescope sights were frequently applied. Carlos Clark of Windsor, Vt., in 1836 adopted the false muzzle for the purpose of preventing wear on the rifling when loading, and it was generally used with this style of arm.

The first military weapon employed by the United States government was the Charleville musket, the national arm of France, which was brought to this country in large quantities during the Revolutionary War through the influence of Marquis de Lafayette. The French model of 1763 served as an example for American private manufacturers who were encouraged by the government. These muskets were heavy smooth-bore flintlocks taking an ounce ball and fitted with bayonets. In 1795 the government armory at Springfield, Mass., was established and the manufacture of muskets by the government was begun during that year. The Charleville musket as improved in 1797 continued to be the standard type of military weapon. The Harper's Ferry armory was established in 1796, but the fabrication of arms was not begun until 1801. In 1804 rifles were produced there in small quantities. A rifle resembling the sporting model of the period was brought out at this armory in 1814. It had a half-octagon barrel, short forestock, no bayonet and a curved butt plate, and was adapted to a one-half ounce ball. The Hall rifle issued in 1818 was the first breechloading rifle to be manufactured by the government. It was originally a flintlock, but was later changed to a per-

cussion lock arm. In 1822 the muzzleloading principle was still retained in the musket and rifle of that date, issued as a new model. The musket and rifle of the model of 1842 were the first service weapons to be originally made with percussion locks.

During the Civil War a great variety of arms were in use. The percussion principle was applied to many of the flintlocks in the possession of the government and the musket and rifles made in the government armories were adapted to that style of ignition. Breechloading rifles and carbines of private manufacture were purchased in large quantities, several types of repeating arms doing excellent service. Foreign weapons were also used to some extent, especially in the Confederate service.

At the close of the war the government deemed it desirable to transform the large number of muzzleloading rifles on hand into breechloaders. Many devices for this purpose were submitted to the Ordnance Board and that presented by Smoot, a mechanic at the Springfield armory, was adopted, and the rifles were known as the model of 1865. The progress in the development of ammunition resulted in the production of the rim fire cartridge, a great improvement over the powder and ball charge enclosed in paper previously in use. Centre fire cartridges of .58 calibre, the brass shell containing 70 grains of powder and 450 of lead, became the standard ammunition for the later rifles of this model. In 1868 the calibre was changed to .50, retaining the same weight of bullet and powder charge.

In 1870 the Ordnance Board recommended for trial from the many rifles submitted to them the Remington, Sharps and Ward-Burton, all taking the regulation .50-calibre cartridge. They were all tried in the field, the verdict being that none of them were superior to the Springfield. A reduction in calibre was recommended, however, resulting in the model of 1873 Springfield rifle, calibre .45 taking 70 grains of powder and a 405-grain bullet. In 1885 a bullet weighing 500 grains was adopted as the standard for this cartridge.

The .45-calibre Lee-Remington, and later the .236-calibre Lee straight pull rifles, both embodying the bolt mechanism, were adopted for the United States navy.

Flintlock pistols of large calibre and smooth bore were considered an indispensable weapon of defense during the early history of our country, no traveler on horseback or by stage feeling secure unless one of these weapons was in his possession. Accuracy was a secondary consideration, as they were intended to be used only at short range, and hence were frequently loaded with buckshot as well as with single bullets. Duelling pistols were of a different model, the stocks being attached at an extreme angle with the barrel in order to allow the owner to assume the approved duelling position, with the elbow close to the body. These pistols were made in pairs and they frequently showed a high degree of skill on the part of the makers, being elaborately engraved and inlaid.

In 1830 Samuel Colt began to devote his attention to developing a pistol with a revolving cylinder containing a number of chambers. His efforts were soon crowned with success, and his revolvers gained a wide reputation.

The cylinders were loaded from the muzzle with powder and ball, each chamber containing an independent breechpin adapted to a percussion cap. These weapons were made with a solid frame. Metallic cartridges added much to their utility. Smith and Wesson brought out a revolver with a hinged frame, allowing the chambers to be exposed for loading and the simultaneous ejecting of the discharged shells. The products of these two firms soon became the models for manufacturers throughout the world.

For hunting rifles the breechloading system came into general use during the period of the Civil War. In the West the Sharps .45-calibre rifle chambered for a cartridge containing from 90 to 120 grains of powder and a 550-grain bullet, paper patched, was the standard buffalo hunter's weapon. These rifles weighed from 11 to 16 pounds and were usually equipped with set triggers.

The magazine principle was making rapid advances at this time. In the Henry rifle, the predecessor of the Winchester, the cartridges were loaded into a tube under the barrel, being forced by a spiral spring into the carrier and thrown into the chamber by the action of the lever forming the trigger guard. The standard cartridge remained the .44-40-200 in both rim and later central fire. In 1870 the express principle attracted the attention of sportsmen, consisting in the use of a large powder charge in proportion to the weight of the bullet in order to obtain a high velocity and increased striking power on large game. The .45-90-300 cartridge was one of a number brought out in response to this demand and adapted to the repeating system of rifles.

The formation of the National Rifle Association in 1871 resulted in a series of international long-range rifle contests in which the American teams won a majority of the matches both at home and abroad. The weapons used were of .44 and .45 calibre with from 90 to 120 grains of powder and paper patched bullets of from 500 to 550 grains of hardened lead. The limit of weight of these rifles was 10 pounds and the minimum trigger pull three pounds. Great skill was shown in the manufacture of these rifles and the results attained have not been surpassed in accuracy by later developments in weapons.

Target shooting as a sport became popular throughout the country as a result of these contests and, as many clubs were unable to obtain facilities for long-range practice, shooting at 200 yards in the standing position was widely adopted. The large bore rifles and heavy charges in use at the longer ranges were found to be unnecessary and a gradual reduction in calibres took place. For some years the limit of weight remained at 10 pounds. At the German-American schuetzenfests there were no restrictions as to the weight of the rifle or the trigger pull, and these weapons while impracticable in the field were nevertheless superior for their specific purpose. Hence a change in type in offhand weapons has come about and the standard weapon is the "schuetzen" model, weighing from 11 to 15 pounds. The .32 and .38 calibres are usually adopted. These rifles are frequently equipped with a palm rest, a rod extending down from the forestock, terminating in a knob, enabling the marksman to rest

the left elbow on the hip. A cheekpiece, butt-plate with horns to fit the arm, double set triggers, an aperture or pin head front sight covered with a hood, and a rear elevating vernier sight with a wind-gauge attachment on the tang of the rifle complete the outfit. Telescope sights are increasing in numbers. Lubricated grooved bullets slightly hardened with tin are used, many expert riflemen loading them through a false muzzle, the shell being afterward inserted at the breech. The advantages claimed for this system are the perfect fitting of the bullet to the grooves and the cleaning of the bore as the bullet is forced down through the rifling. Such weapons are capable of placing 10 shots in a 2-inch circle at 200 yards from a machine rest.

Target shooting with the pistol and revolver at distances up to 50 yards is a popular sport, encouraged by the United States Revolver Association. The modern single shot target pistol has a 10-inch barrel and is made in calibres of from .22 to .44, .22-calibre rim fire ammunition being generally favored. The accuracy obtainable is surprising, 10 shots having been placed in a 3-inch circle at 50 yards, the weapon being shot in the regulation position with the arm extended, free from artificial support. Revolvers for target purposes are usually of from .32 to .44 calibre, with barrels from six to eight inches in length.

Muzzleloading shotguns both flintlock and percussion were almost exclusively imported from England and the Continent. The products of Joseph Manton were unsurpassed for balance, fine shooting qualities and workmanship and served as models for American fowling pieces. Barrels and locks were largely imported, in fact it is only within a comparatively few years that many shotgun barrels have been made in this country. The introduction of the Lefauchaux breechloading system from France in 1852 marked a great advance over previous inventions. A paper and brass-shell was used with a small percussion cap in the centre of the base of the cartridge, ignited by the blow of the hammer on a brass pin extending through the side of the head of each shell, this pin also affording a means for withdrawing the empty case. The barrels were hinged, the breech being opened for the insertion of the shells by means of an under lever. This system formed the basis for most American breech-loading actions for double and single guns. Improvements have been made from time to time until to-day the American hammerless ejecting gun operated by a top lever using centre-fire shells is second to none. The various styles of single trigger mechanisms are gaining in popularity. The repeating shotgun is distinctly American, the mechanism in most cases being operated by the sliding motion of the fore end.

The various types of weapons we have mentioned have been developed during the era of black powder, a propellant which while producing remarkably uniform results has changed but slightly in its constituents during the past century.

The introduction of smokeless or nitro powder has marked a new era in the field of fire-arms. Its characteristic features are absence of smoke and fouling, reduced recoil, reduction in bulk and the attainment of high velocities with relatively low chamber pressures.

In military weapons smokeless powder was at once conceded to possess obvious advantages. During the Spanish-American War smokeless ammunition was made in large quantities for the .45-calibre Springfield rifle. The Ordnance Board after careful investigation adopted 15 Sept. 1892 the Krag-Jorgensen .30-calibre rifle. This arm is of the bolt-operated type, weighs nine and three-fourths pounds without the bayonet and has a magazine holding five cartridges. The cartridge contains a bullet of 220 grains, consisting of a lead core and a steel jacket, the charge of smokeless powder giving a muzzle velocity of 2,000 feet per second as compared with 1,300 feet for the .45-calibre Springfield. A marked reduction of recoil, a flat curve of trajectory and economy in the weight of ammunition, as well as a great gain in rapidity of fire are notable features. A 10-inch twist is required to rotate properly the long bullet.

In 1903 the Ordnance Board adopted a new weapon known as the .30-calibre Springfield. The breech mechanism resembles in many respects a form of the Mauser-bolt action, which has given excellent satisfaction. The magazine is of the box type and is situated under the receiver. The cartridges are loaded from a clip, the magazine being provided with a cut-off so that the weapon may be used as a single loader if desired. Twenty shots have been fired in government tests in 28 $\frac{3}{4}$ seconds. The cartridge has a cannelure cut around the head to engage in the extractor in place of the flange on the Krag-Jorgensen ammunition, allowing the cartridges to lie compactly in the magazine. The 150-grain jacketed bullet is used, the powder charge being increased in order to give a muzzle velocity of 2,700 feet per second. The rifle weighs, without bayonet, 8.69 pounds and is 3.60 feet long. The bayonet adds one pound in weight and 1.33 feet in length. In 1917 a rifle of similar dimensions, taking the same cartridge, but of a British type was adopted for use in the Great War.

The telescope sight is receiving attention for the equipment of military sharpshooters. The hyposcope, a detachable instrument consisting of a series of mirrors in a tube extending below the line of sight, allowing aim to be taken without the body of the soldier being exposed, has recently been placed before the Ordnance Board for adoption.

In hunting rifles the jacketed bullet and smokeless powder have found instant favor. For this purpose the lead core of the bullet is exposed at the point and upon striking game it expands or mushrooms, making a most deadly wound. Though the .30-40 government cartridge with a soft nosed bullet is largely used a number of special cartridges have been designed. The .405 Winchester adapted to their repeating rifles contains a 300-grain bullet, the smokeless powder charge developing a muzzle velocity of 2,204 feet per second and a muzzle energy of 3,235 foot pounds.

The application of smokeless powder to revolver ammunition has resulted in increased efficiency, as an unlimited number of shots may be fired with no perceptible fouling of the barrel or cylinder and a degree of accuracy maintained which was unattainable in the days of black powder.

Shotgun cartridges are almost exclusively loaded with this propellant and American ma-

chine-made guns are now being produced in weights of from six to seven pounds without the recoil becoming excessive or general effectiveness being sacrificed. The imported twist barrels have given way to special steel barrels of light weight and great tensile strength.

Automatic firearms have within the past few years attracted much attention. The term automatic literally means an arm that continues its acts of loading and firing after the first shot until the ammunition is exhausted. The arm that after firing the first shot performs the work of ejecting the empty shell, recharges the chamber and leaves the arm ready for the next shot by merely pressing the trigger, is a semi-automatic firearm, but the term automatic has been generally applied to this weapon. There are two systems in vogue at present, that by which a portion of the gas from the explosion is utilized to operate the breech mechanism; the other, in which the barrel recedes by the action of the recoil and accomplishes the same result. The latter system has been successfully applied to American repeating pistols which are a marked improvement over the revolver, as in the latter there is an inevitable escape of the explosive gases between the cylinder and the barrel. Metal-jacketed bullets and smokeless powder are used on these repeating pistols. Small-bore rifles designed on the recoil-operated system are a popular weapon and a repeating semi-automatic shotgun is now before the public. See MACHINE GUN.

There are many excellent types of firearms in use that seem well adapted for all time, but progress is constantly being made. The automatic and semi-automatic weapon will be an important factor in the warfare and sport of the future. See ARMS AND ARMOR; ARTILLERY; ORDNANCE; GUN; MUSKET, etc.

SMALLEY, smāl'ī, George Washburn, American journalist: b. Franklin, Norfolk County, Mass., 2 June 1833; d. 1916. He was graduated at Yale in 1853, read law, and, having been admitted in 1856 to the bar, practised in Boston until the beginning of the Rebellion, when he became correspondent in the field for the New York *Tribune*. From November 1861 to October 1862 he acted as war correspondent, first in South Carolina, then in Virginia, in the campaigns of the Shenandoah and the Potomac, then was on the editorial staff till 1867, and in that year organized the *Tribune's* European bureau in London. There he remained in charge of all European correspondence until 1895, when he returned to the United States as American correspondent of the London *Times*. His publications are 'Review of Bright's Speeches' (1868); 'London Letters' (1890); 'Studies of Men' (1895); 'Anglo-American Memories' (1911; 2d series, 1912).

SMALLPOX. The date of the origin of smallpox, as is the case with other similar diseases, has not been definitely established. The probabilities are that it made its first appearance in the Orient and was thence introduced into western Europe. A severe epidemic of smallpox is said to have occurred in Iceland in 1241; we have no trustworthy record, however, of the disease before the 15th century, when it began to appear in Europe. Epidemics became progressively more common in the 16th and 17th centuries and reached their maximum of frequency and extent in the 18th century. For official data concerning the disease in the 17th and 18th centuries we are chiefly indebted to the London Bills of Mortality, which gave a weekly account of burials and christenings, and from 1629 to 1845 the specific causes of death, including smallpox.

It has been estimated that the population of London in 1685 was 530,000. The mortality from smallpox for an average of 10 years from 1681 to 1690 was over three in a thousand. In most of the years of the century, indeed, the mortality was in the neighborhood of two in a thousand, sometimes more and at other times less. This would mean an average of over 1,000 smallpox deaths in London a year. As it has been reckoned that about one in five would die, there were evidently about 5,000 cases of smallpox annually in the English capital.

As will be readily comprehended, smallpox was a great scourge before the days of vaccination; but a small percentage of people escaped its ravages. Indeed smallpox was as prevalent in the 18th century as measles is at the present time. Haygarth gives an account of an epidemic of smallpox in Chester, England, in 1774, at which time, out of a population of 14,713, 1,202 persons took the disease and 202 died. At the termination of the epidemic there were but 1,060 persons, or 7 per cent of the population, who had never had smallpox. In 1722 smallpox devastated the small English town of Ware, whose population numbered 2,515 souls; of this number there were only 914 persons susceptible to smallpox,

inasmuch as 1,601 had already passed through an attack of the disease. During the epidemic referred to 612 persons were attacked, leaving but 302 individuals in the entire town who had never had smallpox. Eighty-five per cent of the population, therefore, were smallpox survivors.

With these official figures in mind, we may be better able to appreciate the general estimate of the extent of smallpox given by writers of the day. In 1802 Admiral Berkeley, in a speech before the House of Commons, said: "It is proved that in this United Kingdom alone 45,000 persons die annually of the smallpox; but throughout the world what is it? Not a second is struck by the hand of Time but a victim is sacrificed upon the altar of that most horrible of all disorders, the smallpox." King Frederick William III of Prussia, in a dispatch dated 1803, stated that 40,000 people succumbed annually to smallpox in his kingdom. The French Minister of the Interior, in reporting on vaccination in 1811, estimated that 150,000 people died in France annually from smallpox; the disease is reported to have destroyed in Russia 2,000,000 lives in a single year. The distinguished mathematician, Daniel Bernouille, writing in 1760 to 1765, calculated that not less than 15,000,000 human beings died of smallpox every 25 years. This would give a yearly average of 600,000. Dr. Lettsom estimated that Europe alone claimed 210,000 victims annually. Juncker placed the yearly sacrifice from smallpox in Europe at 400,000. When to these figures are added the deaths due to devastating epidemics in Asia, Africa and America, the estimate of Bernouille does not appear to be overstated.

Smallpox was introduced in the western hemisphere by the Spaniards about 15 years after the discovery of America; in Mexico within a short period 3,500,000 persons are said to have died of the disease. It is alleged that in Mexico, smallpox has exterminated whole tribes of Indians, sparing no one to tell the story of the annihilation. Robertson refers to smallpox among the South American Indians as follows: "In consequence of this (various calamities), together with the introduction of smallpox, a malady unknown in America and extremely fatal to the natives, the number of people both in New Spain and Peru was so much reduced that in a few years the accounts of their ancient population appeared almost incredible." Catlin states that of 12,000,000 American Indians, 6,000,000 fell victims of smallpox. Washington Irving's 'Astoria' makes mention of terrible epidemics of smallpox among the Indians in which "almost entire tribes were destroyed." Lloyd, who translated Prince Maximilian's 'Travels in the Interior of North America,' states in the preface, in reference to a smallpox epidemic among the Indians in 1837: "The Big-Bellied Indians and the Ricarees, lately amounting to 4,000 souls, were reduced to less than the half. The Assiniboin, 9,000 in number . . . are, in the literal sense of the expression, nearly exterminated."

According to records published by the government of Denmark, a devastating epidemic of smallpox appeared in Iceland in 1707, which destroyed 18,000 out of the 50,000 inhabitants; 36 per cent of the total population perished. It is stated on good authority that in the Danish

colony of Greenland, in 1734, 6,000 to 7,000 persons perished from smallpox, representing nearly two-thirds of the population. The disease was introduced by a Danish ship.

The natives of New England likewise suffered great losses by smallpox. Robertson writes: "At the same time, 1631, the smallpox, a distemper fatal to the people of the New World swept such multitudes of the natives that some whole tribes disappeared." In 1752 Boston had a severe epidemic of this dread disease. The population of Boston at that time was 15,684; of this number 5,998 had previously had smallpox. During the epidemic 5,545 persons contracted the disease in the usual manner and 2,124 took it by inoculation. Eighteen hundred and forty-three people escaped from the town to avoid the danger of infection. There were, therefore, left in the city but 174 people who had never had smallpox. The population at the end of the epidemic practically consisted of persons who had survived an attack of this fear-inspiring malady.

Smallpox was essentially a disease of children in former times; to such an extent was this true that the disease was called *Kinds-pocken* (childpox or *Kindsblattern*). Owing to the pronounced contagiousness of the disease and the almost universal susceptibility to it, smallpox was largely contracted during child life, as measles is at the present time. But comparatively few adults contract measles at the present day because they are protected by a previous attack in infancy or childhood. The same conditions obtained with relation to smallpox in the days before vaccination. The adult population represented mostly the survivors from smallpox in childhood. It was estimated that less than 6 per cent of persons were naturally insusceptible to the disease. Vaccination has totally changed the age period of smallpox. It is now excessively rare for a successfully vaccinated child under five years of age to die of the smallpox; it is even uncommon for a successfully vaccinated child under 10 years of age to die of the disease, as was adequately proved in the testimony presented before the British Royal Commission on Vaccination. Smallpox, perhaps more than any other disease, has inspired fear and terror in the popular mind because of its loathsome appearance, its extreme contagiousness and its disfiguring consequences.

Lord Macaulay, writing of the untimely death from smallpox in 1694 of the young and beautiful Queen Mary of England, gives us a powerful pen picture of the ravages of this pestilence: "That disease over which science has since achieved a succession of glorious and beneficent victories, was then the most terrible of all of the ministers of death. The havoc of the plague has been far more rapid, but the plague has visited our shores only once or twice within living memory; and the smallpox was always present, filling the churchyards with corpses, tormenting with constant fears all whom it had not yet stricken, leaving on those whose lives it spared the hideous traces of its power, turning the babe into a changeling at which the mother shuddered, and making the eyes and cheeks of the betrothed maiden objects of horror to the lover." During certain periods in England, a very large percentage of the people were pock-

at shipping to unimpaired condition and to be in a position to
 perform all of her duties and to be able to take care of her

SMALL-POX

- FIG. 1 Vaccinia on rabbit's cornea, showing several vaccine bodies in vacuoles adjoining the nuclei of epithelial cells. x 1000 diameters.
- FIG. 2 Vaccine bodies in further development, showing the differentiation in structure. From the cornea of a rabbit. x 1000 diameters.
- FIG. 3 Small small-pox parasite in protoplasm of epithelial cells of skin, in vacuoles adjoining the nucleus.
- FIG. 4 A more advanced stage, showing beginning differentiation of the parasite.
- FIG. 5 Larger parasites in stage preceding segmentation.
- FIG. 6 Segmentation of parasite; from a case of experimental small-pox in the monkey.
- These figures illustrate the first phase of development of the organism within the cell protoplasm. The nuclei are not affected. Micro-photographs multiplied 1000 diameters.
- FIG. 7 Beginning of intranuclear development. Two nuclei with small round vesicles inolved.
- FIG. 8 Showing further development. x 1500 diameters.
- FIG. 9 Beginning formation of a sporoblast within the nucleus. There are two sporoblasts consisting each of a central vesicle with a series of small chambers around it.
- FIGS. 10, 11, 12 and 13 The further development of sporoblasts.
- FIG. 14 Spore formation with free spores in the nucleus.

SMALL POX

marked. Ben Jonson, the Elizabethan dramatist, wrote:

*Evilous and foule disease, could there not be,
One beautie in an age and free from thee.*

Not only did the disease destroy life, disfigure and maim, but it was at one time the most common cause of blindness. The early records of the London Asylum for the Indigent Blind showed that two-thirds of the inmates had lost their sight as a result of smallpox.

Smallpox was a great scourge before the introduction of vaccination. In London during the 18th century it caused one-twelfth of all deaths. Everyone felt that he had to pass through an attack of smallpox at some period of his life. One of Horace Walpole's correspondents (Wampole's 'Letters') wrote: "Poetry is as universally contagious as smallpox: Everyone catches it once in a life time at least, and the sooner the better." The Germans had a proverb which expressed the same thought: "From love and smallpox but few remain free." Most children in London contracted smallpox before the age of seven.

Symptoms.—The patient during the early stages of a classic attack of smallpox suffers from a pronounced chill, followed by sudden fever and severe backache; nausea and vomiting occur with great frequency, and the latter may persist for several days. Dizziness and general aches and pains are common. In severe cases, there is great weakness and prostration. During this stage, while the symptoms may be most suggestive of smallpox, no positive diagnosis can be made, as the "grip" and certain other infections may imitate the early symptoms of smallpox. Not until the eruption appears can one be absolutely sure of the nature of the disease. Many persons are commonly exposed to smallpox before the diagnosis can be definitely established.

Eruptive Stage.—About the third day of the illness the fever abates, the pains subside and the patient begins to feel that his illness is at an end. But he is woefully mistaken, for it has hardly begun. At this time the eruption makes its first appearance; it is not formidable at first sight and looks not unlike a multitude of flea-bites on the face, hands and elsewhere. Soon it spreads over the greater part of the body. From day to day the eruption undergoes a change; soon the face is covered with numerous pustules, the features are swollen beyond their normal proportions and the patient disfigured beyond recognition. The fever again rises and acquires the characteristics of blood-poison fever. The patient suffers greatly from the soreness occasioned by the multitude of pustules present, particularly those on the hands and feet. In severe cases the pustules may reach the enormous number of 30,000 to 40,000. The presence of smallpox sores in the nose and mouth causes great difficulty in breathing and great distress in swallowing.

The Plague of Boils.—At about the end of a fortnight, the patient, if he recovers, has passed through the height of the eruptive process and is led to believe that he is on the road to convalescence. Now a new plague attacks the unfortunate victim, for he begins to be the subject of boils and abscesses which may number but a half dozen or may reach a

hundred or more. In a proportion of smallpox cases, which varies with the severity of the attack, one or both eyes may be damaged, with consequent impairment or loss of vision. An attack of unmodified smallpox runs its course in about five or six weeks. At its conclusion the patient exhibits on his countenance numerous disfiguring pits and scars which remain throughout his life as a sad reminder of the cruel malady through which he has passed.

Smallpox in its usual form is a terrible disease and there is an almost universal susceptibility of the human family to its infection, but there is no malady against which science possesses a surer and more complete safeguard. For that great discovery, the world is indebted to Edward Jenner. Like all other infectious diseases, smallpox varies in severity and fatality in different epidemics. One of the most virulent outbreaks occurred after the Franco-Prussian War in 1871; this became a veritable pandemic, spreading over the entire civilized world and destroying the lives of hundreds of thousands of persons. In other epidemics the type of the disease may be much less virulent and may be characterized by a lower mortality rate.

Since 1896 there has been widely prevalent in the United States a peculiarly mild type of smallpox which kills only a very small proportion of those attacked. Hundreds of thousands of such cases have occurred throughout the country. This mild type is doubtless due to the weakness of the infecting germ. Two entirely different types of smallpox have prevailed in America—one the virulent imported variety which destroys the lives of one-quarter of those whom it attacks, and the other the mild type above referred to. An interesting feature of the latter type is that it is not only mild as to mortality but also as to its contagiousness; practically it attacks only the unvaccinated, while vaccinated persons even if the vaccination dates back 30 or more years are, as a rule, protected against it. The opponents of vaccination point to this mild type of smallpox and say that the disease has lost its terrors. Those who are thoroughly familiar with the subject, however, know that neglect of vaccination may prepare a community for a death-dealing epidemic of the classic type of the disease.

Types of Smallpox.—The most malignant and fatal type of smallpox is that known as hemorrhagic or "black smallpox." In this form, the patient is overwhelmed with the poison and succumbs to it before the characteristic eruption is enabled to appear. Instead of the usual eruption, blood spots occur on the skin and the patient dies in one, two or three days. This malignant type is more prone to occur during virulent epidemics, and appears chiefly in pregnant women, men addicted to alcohol and in those debilitated from various causes.

"Confluent smallpox" is a severe form of the disease in which the vesicles and pustules run together and cover extensive areas of the skin surface. In "discrete smallpox" the pustules are separated by areas of skin free of eruption. The mortality in this type is lower.

When an individual who has been vaccinated some years before exposure to smallpox infection contracts the disease, the course of the malady is apt to be favorably modified by the vaccination. If the vaccination be recent, he

will in all human probability be immune against infection.

The Mortality of Smallpox in Vaccinated and Unvaccinated Persons.—As years pass, the protective power is prone to wane and after a number of years may become completely exhausted. In most instances, some protection is still exerted after many years. The following statistical tables of Welch (Wm. M.) and Schamberg (Jay F.), covering nearly 10,000 cases treated in the Municipal Hospital of Philadelphia between 1870 and 1904, are of interest:

	Cases	Deaths	Percent of deaths
Vaccinated in infancy — good scars	2,718	167	6.16
Vaccinated in infancy — fair scars	1,238	146	11.79
Vaccinated in infancy — poor scars	1,673	364	21.75
Total vaccinated cases.....	5,629	667	12.02
Unvaccinated.....	4,348	1,826	42.00
Total.....	9,977	2,503	25.08

It will be seen from this table that only 12 per cent of vaccinated persons died, as against 42 per cent of unvaccinated. It is furthermore shown that the perfection of the vaccination as indicated by the type of vaccinal scar present influences the mortality. Those with good scars representing the results of excellent vaccination had the lowest fatality rate (a little over 6 per cent).

Treatment of Smallpox.—The treatment of smallpox is eminently preventive: after the disease has once been contracted by an unvaccinated person relatively little of an effective character can be done; this consists largely in supporting the strength of the patient until the disease has run its course. The usual principles underlying the treatment of infectious fevers apply to smallpox. Special care is necessary, however, to protect the eyes from infection by frequent cleansings with mild antiseptic solutions, in order to avoid the possibility of destruction of vision.

Thorough and adequate vaccination is a complete safeguard against smallpox. Isolation of the patient, quarantine of those who have been in contact with him and disinfection of the premises after recovery are important sanitary measures. See VACCINATION.

JAY FRANK SCHAMBERG.

SMALLS, smälz, Robert, American legislator, formerly a slave: b. Beaufort, S. C., 5 April 1839. He received a limited education. In the capacity of pilot he rendered valuable service to the Union cause during the Civil War and was promoted to the rank of captain therefor. During the years immediately following the war he rose to prominence in the Republican party, and became a member of the South Carolina legislature. He afterward served six terms in the National Congress. He was successively appointed collector of the port of Beaufort, S. C., from 1898.

SMALLWOOD, Charles, Canadian physician and meteorologist: b. Birmingham, England, 1812; d. Montreal, Canada, 22 Dec. 1873. He secured a medical education, removed to

Canada in 1853 and engaged in the practice of medicine at Saint Martin's, Isle Jesus. He established a meteorological laboratory which was later described in the *Reports* of the Smithsonian Institution, and conducted many interesting observations, among them that of the effect of light on the action of ozone, and of the influence of electricity in plant germination, as well as discovering the activity of atmospheric electricity in the formation of snow crystals. From 1858 he was professor of meteorology at McGill University, later occupying also the chair of astronomy. Through a grant of funds from the government in 1860 he was enabled to purchase magnetic instruments and he began a series of investigations in 1861. Upon the establishment of the United States signal service system he made arrangements for connections with it in several Canadian cities. He was author of many valuable papers in the *Smithsonian Reports* and was a contributor to magazines.

SMALLWOOD, William, American soldier: b. Kent County, Md., 1732; d. Prince George County, Md., 14 Feb. 1792. He raised a battalion of Maryland troops in 1776, was elected colonel and on 10 July 1776 joined Washington. On 20 August his troops were engaged at the battle of Long Island and bore its brunt from sunrise until its close, leaving half their number on the field. At White Plains on 18 October they were again in the thickest of the fight. Smallwood was promoted brigadier-general for his gallantry. He was engaged at Fort Washington on 16 November, his command again bearing heavy losses, and in 1777 accompanied General Sullivan on his Staten Island expedition. He raised a new battalion of Maryland troops in that year and at the battle of Germantown, 4 Oct. 1777, his command retrieved the day and captured part of the enemy's camp. He was stationed at Wilmington in the winter of 1777-78, captured a British brig laden with provisions and served with Gates in his Southern campaign. He won the thanks of Congress for conduct at the battle of Camden, and was appointed major-general in 1780, but refused to serve under Baron Steuben, though he remained in the army until 1783. He was elected to Congress in 1785 and in 1785-88 was governor of Maryland.

SMALT. See COBALT.

SMALTITE, "gray cobalt," "tin-white cobalt," the chief ore of cobalt, is a tin-white to steel-gray, metallic mineral. Essentially it is cobalt diarsenide, CoAs₂, but nickel is usually present, and as its percentage increases the mineral graduates into chloanthite, the isomorphous nickel diarsenide. It also generally contains iron and a small amount of sulphur. It is usually massive, but crystallizes in the isometric system, the crystals showing distinct octahedral cleavage. As the orthorhombic mineral, safflorite, has the same composition, smaltite is one of the few illustrations of an isodimorphous mineral. Its hardness is 5.5 to 6; specific gravity 6.2 to 6.5; the massive mineral is thus distinguished from the softer and much heavier safflorite. Its color is tin-white to steel-gray; streak grayish-black; lustre metallic; opaque. It is easily fused to a magnetic globule which affords reactions with borax beads, for iron,

cobalt and nickel. Its most noteworthy occurrences are in the silver and copper mines of Saxony, Bohemia and England.

SMART, Christopher, English poet: b. Shipbourne, Kent, 11 April 1722; d. London, 17 May 1771. He was graduated at Cambridge in 1742, but remained there as Fellow of Pembroke until 1747. His early fame as a satirist was supplemented by the accomplishment of more serious work, the most noted of which was his translation of Horace in 1756. His first volume of poems appeared in 1752, but it was not until a half century after his death that he won the distinction for original work in the larger world of letters which still attaches to his name. His 'Song to David,' published in 1763, and written, it is said, upon the walls of his cell during his confinement for debt in a house of detention for such offenders, was at first deemed odd and melancholy. In 1820 it was reprinted in the *London Magazine*, and hailed by Rossetti and others as the greatest poem of the 18th century. Consult Browning, 'Parleyings with Certain People of Importance.' See SONG TO DAVID.

SMART, William, Scotch political economist: b. Renfrewshire, 10 April 1853; d. 1915. He was graduated at the University of Glasgow and entered upon a business career. In 1884 he began to write upon economic subjects, and two years later received a lectureship at the College of Dundee; from 1896-1915 he held the Adam Smith professorship at the University of Glasgow, and is widely known as the English translator of Bohm-Bawerk's 'Positive Theory of Capital' (1891), and as the editor of Wieser's 'Natural Value' (1893). He is the author of 'Studies in Economics' (1895); 'The Distribution of Income' (1899); and 'Taxation of Land Values and the Single Tax' (1900).

SMART-WEED, or WATER-PEPPER, glabrate, annual herbs (*Persicaria hydropiper*, and other species of the same genus), of the buckwheat family, naturalized from Europe, and found in wet places. They have alternate, lanceolate leaves, with cylindric fringed ocreæ, and panicked racemes of small flowers with greenish calyx. They also have a juice which is not only acrid to the taste, but will inflame tender skin, and has diuretic and, possibly, other medicinal properties.

SMEATON, smē'ton, John, English civil engineer: b. Austhorpe, near Leeds, Yorkshire, 8 June 1724; d. there, 28 Oct. 1792. His father was an attorney, and took him to London in 1742, where he attended the courts in Westminster Hall; but after discovering his son's disinclination to the profession he yielded, and in 1751 Smeaton began a course of experiments on a machine of his own invention, to measure a ship's way at sea, and made two voyages with Dr. Knight to try the effect of it, and also for the purpose of making experiments on a compass of his own construction, which was rendered magnetic by Dr. Knight's artificial magnet. In 1753 he was elected a Fellow of the Royal Society. In 1755 the Eddystone lighthouse was burned down, and Smeaton was entrusted with the task of rebuilding it. Operations were begun in August 1756 and completed in October 1759. It stood until 1882, when it was replaced by a new structure. In the year

in which the lighthouse was finished he was awarded the Copley medal of the Royal Society. After this Smeaton was employed on many works of great public utility. He made the river Calder (in Yorkshire) navigable; planned and executed the Forth and Clyde Canal in Scotland, constituting a waterway for traffic passing between the Atlantic and the German Ocean. He was appointed engineer to Ramsgate Harbor, and improved it by various operations, of which he published an account in 1791. He built a steam-engine at Austhorpe, and made experiments with it to ascertain the power of Newcomen's engine, which he brought to a greater degree of perfection, both in its construction and powers. During many years of his life he was a frequent attendant upon Parliament, where his opinion on various works begun or projected was continually asked. Smeaton spent much of his leisure in the study of astronomy, for which purpose he fitted up an observatory in his house. Consult his 'Reports' (1797); Smiles, 'Lives of the Engineers' (1861).

SMEDLEY, William Thomas, American painter: b. Chester County, Pa., 26 March 1858. He was taught engraving in Philadelphia and painting in the Pennsylvania Academy of Fine Arts. He subsequently studied in New York and in Paris under Jean Paul Laurens. Opening a studio in New York in 1880 he became much sought after as an illustrator of books and periodicals. In 1882 he traveled with the Marquis of Lorne through Western and Northwest Canada to obtain drawings for illustrating 'Picturesque Canada.' He made a sketching tour around the world in 1890. His work is distinguished by remarkable purity of line, delicacy and power of dramatic expression. Among his oil paintings may be mentioned 'An Indiscreet Question'; 'A Thanksgiving Dinner'; and 'A Summer Occupation.'

SMELL. See SENSES.

SMELLIE, smē'lī, William, Scottish author and naturalist: b. Edinburgh, 1740; d. there, 24 June 1795. His earliest important work was the compiling of a large part of the first edition of the 'Encyclopædia Britannica,' published in 1771. Six years earlier he had gained some prominence in the field of natural history by a 'Dissertation on the Sexes in Plants,' in which he opposed the teachings of Linnæus, and in 1780 he published the first part of his translations of Buffon's 'Natural History.' In 1790 his own contributions to the subject were edited and published under the title 'Philosophy of Natural History.' He was also the author of many other works; among them were biographies of Hume, Adam Smith and other prominent Englishmen.

SMELT, a genus (*Osmerus*) of fishes of the family *Argentinidae* and closely related to the *Salmonidae*. The body is slender and somewhat compressed; the eyes large and round and the under jaw projecting. The American smelt (*O. mordax*) is 10 to 11 inches long; the head and body are semi-transparent, with the most brilliant tints of green and silver. It has a strong odor, by many compared to that of violets. It inhabits the sea-coast from the Gulf of Saint Lawrence to Virginia as well as the depths of those lakes, such as Champlain and Memphremagog, which have a sandy bottom,

and in the winter and early spring ascends rivers in great multitudes, for the purpose of depositing its spawn. It is highly esteemed as food owing to its delicate flavor. The smelt fishery is one of considerable and growing importance and is carried on by means of nets and lines during the winter months. Some of the land-locked varieties in the lakes of Maine are said to excel even the marine fish in flavor. The European smelt (*O. eperlanus*) is scarcely distinguishable from the American and is the object of an important fishery. The surf smelt (*Hypomesus pretiosus*) is a related fish about a foot in length, found abundantly on the coasts of California and Oregon and is said to be deliciously flavored. A species of cisco or whitefish (*Argyrosomus osmeriformis*), found in the lakes of central New York, is there known as the smelt, which fish it resembles superficially in form and size.

SMELTING. See BLAST FURNACE.

SMERDIS, smēr'dis, the Greek name of the brother of Cambyzes, king of Persia. In Persian inscriptions he is known as Bardija. He incurred the envy of Cambyzes who was warned in a dream that Smerdis should take from him the throne and was, by the king's command, secretly assassinated. His name was taken by one of the Magi, Gaumata, who won the favor of the people and occupied the throne for seven months. Gaumata in 521 B.C. was recognized by Darius as an impostor and usurper and consequently put to death.

SMET, Peter John de. See DE SMET, PETER JOHN.

SMETANA, smě-tā'nā, Frederick, Bohemian composer: b. Leitomischl, Bohemia, 2 March 1824; d. Prague, 12 May 1884. He was a well-known orchestral leader in Austria and Sweden and was the composer of numerous symphonies and other operatic works. Among them are 'Die Brandenburger in Böhmen' (1866); 'Richard III'; 'Mein Vaterland'; 'Triumph-symphonie' (1853).

SMETHWICK, smeth'ik, England, a borough in Staffordshire, three miles west of Birmingham. It has many machine shops, rivet, screw and tube works, chemical and glass-works, iron foundries, etc. It is governed by a mayor, aldermen and council. Within its borders lies the ancient village of Domesday. Pop. about 70,694.

SMILAX, a lilaceous genus, with entire or lobed leaves, often coriaceous and shining, and greenish, dioecious, six-merous flowers with recurved perianth. The pedicels are gathered in axillary umbels, on long peduncles, and bear red, purple or black berries. They have stout, long, tuberous rootstocks and woody or herbaceous stems that are usually twining and often climbing by tendrils, which are two stipules arising from the sheaths of the petioles. *S. pseudoclimax*, *S. rotundifolia* and others, are the familiar green or cat-briers, that twist themselves into impenetrable thickets, and are, moreover, well armed with vicious, strong prickles; they are interesting in winter, however, on account of their long-lingering leaves and bunches of berries. The American carrion-flower (*S. herbacea*) has an annual stem that is very artistic in young growth, but the tassels of bloom when open in early spring have an insupport-

able putrid odor. The rootstocks furnish medicines in several countries; those of several South American species yield china root and sarsaparilla (q.v.).

The smilax used for decoration by florists is an entirely different plant (*Myrsiphyllum asparagoides*) raised under glass.

SMILES, Samuel, Scottish writer: b. Haddington, 23 Dec. 1812; d. London, 17 April 1904. He was educated for the medical profession and practised for some years as a surgeon at Leeds, when he became editor of the *Leeds Times*. In 1845 he became secretary to the Leeds and Thirsk Railway, and in 1854 to the South-Eastern Railway, from which post he retired in 1866. He is the author of many works on industrial enterprise and other themes, the chief of which are 'Life of George Stephenson' (1857); 'Self-Help' (1859), which attained a very wide circulation and is the work by which he is best known; 'Workmen's Earnings, Strikes and Wages' (1861); 'Lives of the Engineers' (1861 and 1875); 'Industrial Biography' (1863); 'Lives of Boulton and Watt' (1865); 'The Huguenots, their Settlements, Churches, and Industries in England and Ireland' (1867); 'Character' (1871); 'The Huguenots in France after the Revocation of the Edict of Nantes' (1874); 'Thrift' (1875); 'Lives of Thomas Edward' (1876); 'Robert Dick' (1878); 'George Moore, Merchant and Philanthropist' (1878); 'Self-Effort' (1889); 'Jasmin, the Barber-Poet' (1891); and 'Josiah Wedgwood' (1894).

SMILEY, smi'll, Albert Keith, American humanitarian of Quaker descent: b. Vassalboro, Me., 17 March 1828; d. 2 Feb. 1912. He was graduated at Haverford College in 1849 and was instructor there until 1853. He was engaged as a school principal in 1853-79. In 1869, with his twin-brother, Alfred, he purchased a tract of land at Lake Mohonk, Ulster County, N. Y., and in 1870 erected a summer hotel there. The holdings of the estate were gradually increased until they numbered about 5,500 acres. From 1879 Smiley was a member of the United States Board of Indian Commissioners, and from 1882 until 1904 he annually invited to Lake Mohonk as his personal guests for four days more than 200 persons for the purpose of discussing American Indian affairs. After 1904 the affairs of the dependent peoples of the Philippines, Porto Rico and Hawaii were also discussed. From 1894 he held annual conferences in the interests of international arbitration, to which were invited more than 300 persons, also his personal guests. With his brother Alfred he in 1889 purchased another large tract of land at Redlands, Cal., which he made into a park known as the Cañon Crest Park, which is kept open to the public. He presented a library costing \$71,000 to Redlands. He was a member of the board of trustees of Brown University from 1875, and was an original member of the board of trustees at Bryn Mawr College.

SMILEY, Daniel, American humanitarian, half-brother of A. K. Smiley (q.v.): b. Vassalboro, Me., 29 Nov. 1855. He was graduated at Haverford College in 1878 and until 1881 was engaged in teaching Latin and Greek at the William Penn Charter School, Philadelphia. He assisted his brother Albert with the man-

agement of the Lake Mohonk summer resort, and from 1882 was connected with the management of the conferences held there. He became owner of both the Lake Mohonk estate and that at Cañon Crest Park, Redlands, Cal., upon the death of his brother in 1912. He is a trustee of Haverhill and Vassar colleges, and of the State Normal School at New Paltz, N. Y. He succeeded his brother on the United States Board of Indian Commissioners in 1912.

SMILEY, Sarah Frances, American author: b. Vassalboro, Me., 30 March 1830. She is well known as a religious speaker and writer, is a Biblical scholar and linguist and is the founder and director of the Society for Home Study of the Holy Scriptures and Church History. She has published 'Who is He?' (1868); 'Fulness of Blessing' (1876); 'Garden Graith' (1880), etc.

SMILLIE, sm'li, George Henry, American painter: b. New York, 29 Dec. 1840. He traveled and studied his profession in Europe and America and many of his works, chiefly landscapes, are to be seen in public and private galleries, American and European, notably 'Autumn Afternoon,' Metropolitan Museum; 'Near Ridgefield, Conn.,' Lotos Club, New York City; 'Light and Shadow Along Shore,' Union League Club, Philadelphia; 'On the Merrimack River,' 'Near Newburyport' and 'At Marblehead Neck,' London, England. He was a member and for four years treasurer of the American Water Color Society; in 1882 he became a National Academician and was recording secretary and councilman for 10 years of the Academy.

SMILLIE, James D., American painter: b. New York, 16 Jan. 1833; d. 1909. Before becoming a painter he made his reputation as a landscape engraver. He was one of the founders of the American Water Color Society and one of the "original fellows" of the Painter-Etcher Society of London, England. In 1876 he became a National Academician. He served a term as president of the New York Etching Club, and is well known for his writings on etching.

SMIRKE, sm'rk, Robert, English painter: b. near Carlisle, in 1751; d. London, 5 Jan. 1845. He was originally employed in painting coach panels, but soon proved himself capable of excelling in a much higher branch of the art; and before the appearance of Wilkie had no great rival as a genre painter. He was elected a member of the Royal Academy in 1792, the year when Sir Joshua Reynolds died, and gave as his presentation picture 'Don Quixote and Sancho.' A large proportion of his pictures are admirable illustrations of the creation of Cervantes' pen. Among others may be mentioned Sancho's 'Audience of the Duchess,' 'Don Quixote addressing his Princess Dulcinea,' and the 'Combat between Don Quixote and the Giants interrupted by the Innkeeper.' Among his other works a first place is due to his 'Infant Bacchus,' 'Psyche,' the 'Angel Justifying Providence,' from Parnell's 'Hermit'; the 'Gipsy,' and the 'Fortune-tellers.'

SMITH, the most common family name. In the early history of the world's industry every worker in metals or every one who ran a forge was called a smith. If he worked silver

or lead he was a whitesmith, if gold a goldsmith and if iron a blacksmith. In course of time John, the smith, came to be known as John Smith, Hans as Hans Schmidt, and so on. Metal working being common, Smiths became numerous, and now every directory has pages of Smiths.

SMITH, Adam, Scottish economist and philosopher: b. Kirkcaldy, Fifeshire, 5 June 1723; d. Edinburgh, 17 July 1790. He studied at the University of Glasgow, where he remained until 1740, when he went to Balliol College, Oxford. Quitting Oxford, and all views to the Church, which had led him there, in 1748 he settled at Edinburgh, and delivered some courses of lectures on rhetoric and polite literature. In 1751 he was elected professor of logic at Glasgow, and the year following of moral philosophy at the same university. Both in matter and manner his lectures were of the highest merit. Those on moral philosophy contained the rudiments of two of his most celebrated publications, of which the first, the 'Theory of Moral Sentiments,' appeared in 1759, and was most favorably received. His theory makes sympathy the foundation of all our moral sentiments. To this work he afterward added an 'Essay on the Origin of Languages'; and the elegance and acuteness displayed in these treatises introduced him to the notice of several eminent persons, and he was engaged in 1764 to attend the duke of Buccleuch in his travels. A long residence in France with this nobleman introduced him to the acquaintance of Turgot, Quesnay, Necker, D'Alembert, Helvetius and Marmontel, to several of whom he was recommended by David Hume. He returned to Scotland in 1766, and at Kirkcaldy led a life of strict study and retirement for 10 years, the fruit of which was his celebrated 'Inquiry into Nature and Causes of the Wealth of Nations' (1776). This work has become a standard classic and may be deemed the formal precursor of the modern sciences of political economy. (See POLITICAL ECONOMICS). It owed something to French thinkers, but arranged the ideas derived from them in an original fashion. Its basic contention is that national progress is best secured by freedom of private initiative within the bounds of justice. Subsequently he was made commissioner of customs for Scotland, and in 1787 was chosen rector of the University of Glasgow. A short time before his death he ordered all his manuscripts to be burned, except a few detached essays. Numerous editions both of the 'Moral Sentiments' and the 'Wealth of Nations' have been published. Of the former the sixth edition contained considerable additions and corrections. This work was translated into French by the Marquis de Condorcet. A volume of additions and corrections to the first two editions of the 'Wealth of Nations' appeared in 1784, and was included in the third edition, published the same year. The best of the later editions of this standard work are those published under the editorship of Macculloch (with life notes and supplementary dissertations 1828; often reissued), Thorold Rogers (1870), J. S. Nicholson (1884), and Belfort Bax (1887). The 'Wealth of Nations' has been translated into several European languages—into French by Germain Garnier (1802; new ed., 1860); into German by Garve

(1794-96), and by Asher (Stuttgart 1861). (See *WEALTH OF NATIONS, THE*). Consult Stewart, 'Life of Adam Smith' (4th ed., 1843); Mackintosh, 'Progress of Ethical Philosophy' (in Vol. I of his 'Misc. Works,' 1854); Rae, 'Life of Adam Smith' (1895); Graham, 'Scottish Men of Letters in the 18th Century' (1901).

SMITH, Sir Albert James, Canadian statesman: b. Shediac, New Brunswick, 1824; d. 1883. He was called to the bar of New Brunswick in 1847, served in the New Brunswick assembly in 1852-67, was a member of the executive council in 1856-63, attorney-general in 1862-63 and premier in 1864-66. He was elected to the Dominion Parliament in 1867, and was Minister of Marines and Fisheries in 1873-78. He was the representative of the Dominion government before the Halifax Fisheries Commission in 1877. In 1878 he was knighted.

SMITH, Albert William, American mechanical engineer: b. Westmoreland, N. Y., 30 Aug. 1856. He was graduated at Cornell University in 1878, and was assistant professor in mechanical engineering there in 1887-91. In 1891-92 he was professor of machine design at the University of Wisconsin, and in 1892-1904 he was professor of mechanical engineering at Leland Stanford Jr. University. From 1904 he was director of mechanical engineering at Sibley College, Cornell University, where since 1915 he has been dean. Author of 'Elementary Machine Design' (1895); 'Material of Machines' (1902; 2d ed., 1914), etc.

SMITH, Alexander, Scottish poet and essayist: b. Kilmarnock, 31 Dec. 1830; d. Wardie, near Granton, 5 Jan. 1867. After a general education, he learned pattern-designing and removed to Glasgow with the double object of finding employment among its manufacturers and intellectual improvement among its literary society. In 1853 he published his 'Life Drama.' It was at first enthusiastically received as a poem of the highest order, but a reaction of dissent soon set in headed by Aytoun, who in his burlesque tragedy of 'Firmilian' characterized Smith's production as belonging to the "spasmodic" school with Dobell and P. J. Bailey. In 1854 Smith was appointed secretary of the University of Edinburgh, to which the offices of registrar and secretary to the university council were later added, and the following year produced, with Sydney Dobell, a volume of 'Sonnets on the War.' This was followed in 1857 by his 'City Poems,' to which succeeded his longest and best work, 'Edwin of Deira' (1861). He turned his attention seriously to prose composition, and became a regular contributor to leading English magazines.

SMITH, Alexander, American chemist: b. Edinburgh, Scotland, 11 Sept. 1865. He was educated in Edinburgh and Munich, receiving his Ph.D. at the University of Munich. In 1889-90 he was assistant in chemistry at the University of Edinburgh; from 1890 to 1894 he held the chair of chemistry and mineralogy at Wabash College; 1898-1903, professor and director of general and physical chemistry, University of Chicago. In 1911 he was placed in charge of the department of chemistry of Columbia University. He has translated sev-

eral important foreign works on chemistry, and published among others 'Laboratory Outlines of General Chemistry' (1899); 'Teaching of Chemistry and Physics' (1902); 'Introduction to General Inorganic Chemistry' (1906); 'General Chemistry for Colleges' (1908); 'Text-Book of Elementary Chemistry' (1914).

SMITH, Alexander Coke, American Methodist bishop: b. Sumter County, S. C., 16 Sept. 1849; d. Asheville, N. C., 28 Dec. 1906. He was graduated from Wofford College, Spartanburg, S. C., in 1886, was appointed professor of mental and moral philosophy there and in 1890 was called to the chair of theology at Vanderbilt University. He was elected bishop of the Methodist Episcopal Church South in May 1902.

SMITH, Alfred E., American legislator and statesman: b. New York City, 30 Dec. 1873. He attended the parochial school of Saint James in New York and after graduation took charge of the trucking business of his father. In 1895 Mr. Smith was appointed clerk in the office of the commissioner of jurors, which position he held until his election to the State assembly in 1903 from the then second district of New York City. Re-elected annually to the assembly, he rapidly rose to leadership in that body; in 1911 he became Democratic leader in the assembly; in 1912 was Democratic floor leader; and in 1913 was the unanimous choice of his party for speaker. Mr. Smith was re-elected to the assembly in 1913 and 1914, and in the spring of 1915 was chosen a delegate to the New York State Constitutional Convention. In this capacity he received high commendation from all parties, and Elihu Root, chairman of the convention, pronounced him one of the best informed in the State government within that body. In the assembly Mr. Smith demonstrated unusual ability. During his term of service the insurance investigation had occurred, with its important effect upon the future of State government; the Aids scandal was largely responsible for the election of Governor Dix; the factory investigation had taken place with Mr. Smith as one of the most active members of the committee. Its findings culminated in the enactment by the Democratic party while in power of the greatest number of humanitarian laws ever placed on the statute books of New York in a single decade. The struggle for and the passage of the Workmen's Compensation Law took place while Mr. Smith was a member of the legislature, as also the great fight for political purity, the elimination of graft and of corporation campaign contributions, resulting in the passage of the Direct Primary Law and the imposition of rigorous penalties for corrupt practices in connection with elections. During Mr. Smith's term of service in the State legislature he constantly fought for the submission of woman suffrage to the people. In 1915 Mr. Smith was elected sheriff of New York County by a plurality of 46,202. In 1917 he was elected president of the board of aldermen of Greater New York. In each office that he held he received the unqualified praise and support of the best element of the press and public regardless of politics. His record made him the logical candidate of his party for governor in 1918. At the election of 5 Nov. 1918 he was elected governor of New

York, carrying Greater New York by the large plurality ever given a gubernatorial candidate. In the State he received 1,009,936 votes against 994,828 for his opponent, Mr. Whitman. One of his first acts as governor was to appoint a reconstruction commission to deal with the great after-war problems. Among his recommendations to the legislature of 1919 were a speedy settlement of pressing problems resulting from the war; the necessity of providing for at least optional municipal ownership of public utilities; providing more liberal home rule for cities; providing a minimum wage for women; the passage of health insurance measures for industrial workers; the amendment of the Workmen's Compensation Law for the purpose of eliminating the direct settlement clause; and the establishment of co-operative conditions between the producer and the consumer. He was able to secure the enactment of several of these recommendations, but many of his remedial measures met defeat in the legislature. The governor allowed liberal appropriations for highway maintenance and repair, and signed the bill providing for equal pay for men and women employed in the school system of the State. Appropriations for the caring of the insane and the feeble-minded during his first year were the largest in the history of the State. In June 1919 he called a special session of the legislature for the purpose of ratifying the woman suffrage amendment to the Federal Constitution.

SMITH, Alfred Holland, American railroad president: b. 1864. He became a messenger boy with the Lake Shore and Michigan Southern Railroad in 1879, was made division superintendent in 1890, assistant superintendent in 1901 and in 1901-02 he was general superintendent of the road. He then became associated with the New York Central Railroad, was its general superintendent in 1902-03, general manager in 1903-12, vice-president in 1906-13, and on 1 Jan. 1914 he was made president of that railroad and its subsidiary lines. He was appointed assistant director-general of railroads by Secretary McAdoo, 29 Dec. 1917, in charge of transportation east of Chicago and north of the Ohio and Potomac rivers; and on 18 Jan. 1918 regional director of Eastern railroads.

SMITH, Andrew Jackson, American army officer: b. Bucks County, Pa., 28 April 1815; d. Saint Louis, Mo., 30 Jan. 1897. He was graduated from the United States Military Academy in 1838, and prior to the Civil War was stationed at various army posts on the Western frontier. In 1861 he was promoted to the rank of colonel in command of the second California Cavalry, and in 1862 brigadier-general of volunteers and chief of cavalry of the Department of the Missouri. He took part in the siege of Corinth and was also engaged in the campaigns of Vicksburg and Mobile. In 1866 he was restored to the rank of colonel in the regular army, but three years later resigned and accepted the appointment of postmaster of Saint Louis. Ten years later he was again made an officer in the United States army, and placed upon the retired list.

SMITH, Archibald Carey, American naval architect and marine painter: b. New York, 4 Sept. 1837; d. 8 Dec. 1911. He received a grammar school education, studied marine painting

under M. F. H. de Haas, and learned the boat-building trade under Robert Fish. In 1860 he built the American sloop *Comet*, which held the American championship for several years. He built the first iron boat in the United States, the yacht *Vindex*, after which he abandoned painting to devote himself entirely to boat designing and building. He built the yacht *Mischief*, also constructed of iron, and the successful defender of the America's Cup against the *Atalanta* in 1881. He designed the schooners *Iroquois*, *Elsemarie*, *Enchantress*—winner of the King's Cup; many yachts, among them the *Meteor* for the German emperor; motor boats and steamboats.

SMITH, Benjamin Bosworth, American Protestant Episcopal bishop: b. Bristol, L. I., 13 June 1794; d. New York, 31 May 1884. He was graduated from Brown University in 1816, took orders in 1818, and in 1820-23 had charge of various churches in Virginia. He was rector of Saint Stephen's Church, Middlebury, Vt., in 1823-28, and from 1830 to 1837 rector of Christ Church, Lexington, Ky. He was consecrated first bishop of Kentucky in 1832, and on the death of Bishop Hopkins in 1868 he became presiding bishop of the Episcopal Church in the United States. He published 'Saturday Evening, or Thoughts on the Progress of the Plan of Salvation' (1876), etc.

SMITH, Benjamin Eli, American editor: b. Beirut, Syria, 7 Feb. 1857; d. 1913. He was graduated from Amherst College in 1877, and has been editor of the 'Century Dictionary'; 'Century Cyclopedia of Names'; and 'Century Atlas.' He has translated Schwegler's 'History of Philosophy' (1879); Cicero's 'De Amicitia,' 'Laelius' (1897); and edited Franklin's 'Poor Richard's Almanac' (1898).

SMITH, Benjamin Leigh, English Arctic explorer: b. 12 March 1828. He was educated at Cambridge, and was called to the bar in 1856. After acquiring a fortune he became interested in Arctic exploration and made his first voyage in the yacht *Samson* in 1871, returning with important acquisition of facts regarding Spitzbergen, where he had penetrated to lat. 81° 24'. He made a second and third expedition to Spitzbergen in 1872-73. By his deep-sea observations he established the fact of warm under-currents flowing beneath the surface water of the Gulf Stream. In 1880-81 on the steamer *Eira* he made two trips, the first resulting in important discoveries on and in the neighborhood of Franz-Josef Land. On the second expedition, the *Eira* was crushed in the ice and sunk 21 Aug. 1881 off Cape Flora. After wintering in that region the crew reached Nova Zembla in August 1882, and were brought home by a relief expedition. He received gold medals from the Paris Geographical Society in 1880 and from Royal Geographical Society in 1881.

SMITH, Buckingham, American historian and philologist: b. Cumberland Island, Ga., 31 Oct. 1810; d. New York, 5 Jan. 1871. He was graduated from the Harvard Law School in 1836, and for several years practised in the courts of Maine, when he took up his residence in Florida. His knowledge of the Mexican language and collections of Indian manuscripts and other relics were acquired during his office as secretary of the United States legation in

Mexico in 1850-52. In 1855-58 he served in a similar capacity the legation at Madrid, and there gathered material of much value regarding the history of the Spanish-American colonies. Among his most important works are 'Narrative of Hernando de Soto' (1854); 'A Grammatical Sketch of the Heve Language' (1861); 'A Grammar of the Pima or Nérome' (1862); 'An Enquiry into the Authenticity of Documents Concerning the Discovery of North America by Verrazzano' (1864).

SMITH, Charles Alphonso, author, educator: b. in Greensboro, N. C., 28 May 1864; now resides at Charlottesville, Va. In 1884 he was graduated from Davidson College, North Carolina, and later pursued graduate work in Johns Hopkins University, where from 1890 to 1893 he was instructor in English. From 1893 to 1902 he was professor of English in Louisiana State University; from 1902 to 1909 professor of English and dean of the graduate department, University of North Carolina. In 1909 he was elected professor of English literature in the University of Virginia, and about the same time was appointed (for 1909-10) Theodore Roosevelt professor of American history and institutions in the University of Berlin. He has written several authoritative works on English grammar, among them 'Old English Grammar and Exercise Book' (1896); 'Elementary English Grammar' (1903), and 'Studies in English Syntax' (1906). He served as associate editor of 'The World's Orators' (1901), and of the 'Library of Southern Literature' (1909).

SMITH, Charles Emory, American journalist: b. Mansfield, Conn., Feb. 1842; d. Philadelphia, Pa., January 1908. He was graduated from Union College in 1861, and five years later became the editor of the *Albany Express*. His connection with the *Philadelphia Press* dates from 1880, when he was made its editor-in-chief. This office he resigned in 1890 to become Minister to Russia. In 1898 he was appointed Postmaster-General of the United States and continued in the Cabinet until 1901, when he resigned. In 1902 he again assumed the editorship of the *Philadelphia Press*.

SMITH, Charles Ferguson, American soldier: b. Philadelphia, Pa., 24 April 1807; d. Savannah, Tenn., 25 April 1862. He was graduated at West Point in 1825 and served there as instructor in tactics and as adjutant and commandant 1829-45. He commanded a light battalion in the Mexican War and won distinction in several actions. He subsequently commanded the Red River expedition, served in the Utah expedition and at the beginning of the Civil War was made brigadier-general of volunteers in the Union army. In 1862 he was active in the battle of Fort Donelson and was promoted to major-general of volunteers.

SMITH, Charles Forster, American classical scholar and educator: b. Abbeyville County, S. C., 30 June 1852. He was graduated at Wofford College in 1872, later studied at the universities of Harvard and Berlin, and took his Ph. D. at the University of Leipzig in 1881. In 1875-79 he was professor of classics and German at Wofford College, and in 1881-82 professor of Greek and Latin at Williams College. He occupied the chair of modern lan-

guages at Vanderbilt University in 1882-83, and that of Greek in 1883-94. Since 1894 he has been professor of Greek and classical philology at the University of Wisconsin. He was president of the American Philological Association in 1903. He translated Hertzberg's 'History of Greece' (1900); edited several volumes of the classics and contributed to the philological journals and literary reviews. Author of 'Reminiscences and Sketches' (1909).

SMITH, Charles Henry, "BILL ARP," American humorist: b. Lawrenceville, Ga., 15 June 1826; d. Atlanta, Ga., 24 Aug. 1903. He was graduated at Franklin College, Georgia, 1848, practised law, first at Rome, Ga., and then at Cartersville, and served in the Confederate army throughout the Civil War, becoming major on the staff of the Third Georgia brigade. He was a State senator 1866-68, and was well known as the author of the "Bill Arp" letters, contributed to the *Atlanta Constitution* and to 'Home and Farm' of Louisville, Ky. He published 'Bill Arp's Letters' (1886); 'Bill Arp's Scrap Book'; 'A Side Show of the Southern Side of the War'; 'Fireside Sketches' (1890); 'Georgia as Colony and State, 1733-1893' (1890); 'The Uncivil War from 1861 to Date.'

SMITH, Clement Lawrence, American Latin scholar and educator: b. Upper Darby, Pa., 13 April 1844; d. 1 July 1909. He was graduated at Haverford College in 1860 and at Harvard University in 1863, later studying at Göttingen University. He was professor of Latin and Greek at Swarthmore College in 1869-70; was assistant professor of Latin at Harvard in 1883-1904, professor in 1883-1904, dean in 1882-1901 and dean of the faculty of arts and sciences in 1898-1902. He was director of the American School of Classical Sciences at Rome, Italy, in 1897-98. He edited the 'Odes and Epodes of Horace' (1894) in the 'College Series of Latin Authors.'

SMITH, David, American naval officer: b. Scotland, 1834; d. Washington, D. C., 29 May 1903. Having been brought to America in childhood, he received his education at the Andover Academy and at Harvard University. Just before the outbreak of the Civil War he entered the Engineer Corps of the United States navy and took part in many of its later operations. He originated the idea of ventilating warships by the exhaust method, but was more widely known for his invention of an apparatus for testing instruments of precision used in engineering. He was promoted rear-admiral and retired in 1896, but took part in the Cuban War.

SMITH, David Eugene, American mathematician and educator: b. Cortlandt, N. Y., 21 Jan. 1860. He was graduated at Syracuse University in 1881 and took his Ph.D. there in 1887. He was master of pedagogics at the Michigan State Normal College in 1891-98; principal of the State Normal School, Brockport, N. Y., in 1898-1901, and has since been professor of mathematics at Teachers' College, Columbia University. He is editor of the *Bulletin of the American Mathematical Society*, and a contributor to other mathematical periodicals. He edited De Morgan's 'Budget of Paradoxes'; is joint author with G. Wentworth and with W. W. Brennan of a number of textbooks; joint author of 'A History of Japanese

Mathematics' (1914); joint translator of Klein's 'Famous Problems of Geometry'; and of Fink's 'History of Mathematics'; and author of 'The Teaching of Arithmetic' (1909); 'The Teaching of Geometry' (1912); 'Rara Arithmetica' (1907); 'Topical Practical Arithmetic' (1912), etc.

SMITH, David M., American inventor: b. Hartland, Vt., 1809; d. Springfield, Vt., 10 Nov. 1881. His first patent was secured in 1832, and he began the manufacture of "awls on the haft." This awl haft was similar to the one now known as the Aiken awl. He removed to Springfield after representing the town of Gilsun in the New Hampshire legislature for 1840-41. In 1849 he patented in America and England a combination lock that could not be picked. Among his other patents were an improvement on the first iron lathe-dog, a pig-splitting machine, two sewing machines, a patent clothes-pin, a spring hook and eye and a blanket hook. In all he secured about 60 patents, including newspaper folding machinery.

SMITH, Edgar Fahs, American chemist and educator: b. York, Pa., 23 May 1856. He was graduated at Pennsylvania College in 1874 and took his Ph.D. at the University of Göttingen in 1876. He was professor of chemistry at the University of Pennsylvania in 1888-1911, vice-provost there in 1899-1911, and has since been provost. He has made important investigations in electrolytic methods of analysis and atomic weight determinations. He is a member of the National Academy of Sciences, was president of the American Chemical Society in 1898, and of the American Philosophical Society in 1902-06. He translated Richter's 'Inorganic Chemistry' (3d ed., 1900), and is author of 'Electro-Chemical Analysis' (new ed., 1918); 'Theories of Chemistry' (1913); 'Chemistry in America' (1914); 'Atomic Weights' (1915); 'James Woodhouse' (1918), etc.

SMITH, Edmund Kirby, American soldier: b. Saint Augustine, Fla., 16 May 1824; d. Sewanee, Tenn., 28 March 1893. He was graduated at West Point in 1845, and entered the Mexican campaign as second lieutenant in the Fifth Infantry. He fought at Palo Alto, Resaca de la Palma and Monterey, was brevetted first lieutenant for bravery at Vera Cruz and Cerro Gordo and captain for gallantry at Conteras. During 1849-52 he taught mathematics at West Point. In 1855 he was appointed captain in the second Cavalry, and later engaged in Indian campaigns, reaching the rank of major. He resigned his commission when Florida seceded. In 1861 he was commissioned colonel in the Confederate army, and in the same year he made brigadier-general. Early in the war he served under Gen. J. E. Johnston, and was severely wounded at Bull Run, 21 July 1861. In 1862, having been made major-general, he commanded the Confederate forces in the Cumberland Gap region, led the advance of Bragg's army in the Kentucky campaign, and on 30 August defeated the Federal troops under General Nelson near Richmond, Ky. His plan included an attack upon Cincinnati, but he withdrew toward Frankfort when Bragg failed to come to his support. He was raised to the rank of lieutenant-general, and took part in the battles of Perryville and Stone River (q.v.) In 1863 he was placed in command of the depart-

ment west of the Mississippi, organized the governments of Louisiana, Arkansas, Texas and Indian Territory, and established a vigorous foreign trade by successfully running the blockade at Galveston. In 1864 he operated against Banks in the Red River campaign, and he was the last Confederate general to surrender (26 May 1865). He was president of the Pacific and Atlantic Telegraph Company 1866-68, president of the Western Military Academy 1868-70, chancellor of the University of Nashville 1870-75 and professor of mathematics in the University of the South, Sewanee, Tenn., from 1875 until his death.

SMITH, Elizabeth Oakes (Prince), American author, wife of Seba Smith: b. near Portland, Me., 12 Aug. 1806; d. Hollywood, S. C., 15 Nov. 1893. She was an occasional contributor to the press for nearly 50 years, and was one of the first women to speak upon the lecture platform, from which she advocated equal suffrage for women and other reforms. Her first volume of verse, collected from the periodicals, was published in 1838 under the title 'Riches Without Wings.' Her other books which had also a short-lived popularity, include 'The Sinless Child and Other Poems' (1843); 'Stories for Children' (1847); 'Woman and Her Needs' (1851), and 'Jacob Feisler,' a drama (1853).

SMITH, Eli, American Protestant missionary and scholar: b. Northford, Conn., 13 Sept. 1801; d. Beirut, Syria, 11 Jan. 1857. He was graduated at Yale in 1821 and at Andover Theological Seminary in 1826. He was ordained that year, and went to Malta to take charge of a missionary printing establishment. He was later connected with the Syrian mission and traveled through Greece, Armenia, Georgia and Persia, with Dr. H. G. O. Dwight, the journey and its reports resulting in the establishment of the Armenian and Nestorian missions. From 1833 he was stationed at Beirut, and in 1838 and 1852 he made lengthy journeys in Palestine. He was thoroughly versed in Arabic, and materially assisted in the production of an improved form and font of Arabic type. He made a lifework of his translation of the Bible into Arabic, and when he died had completed translations of the New Testament, the Pentateuch, and part of the prophetic books. The work was finished by Dr. C. V. Van Dyke (New York 1866-67). He was joint author of 'Missionary Researches in Armenia' (2 vols., 1833).

SMITH, Ellison DuRant, American senator: b. Lynchburg, S. C., 1 Aug. 1866. He was graduated at Wofford College in 1889 and subsequently interested himself in cotton planting. He took an active part in securing improved methods in cotton growing, organized the Farmers' Protective Association, and was instrumental in securing the Boll Weevil Convention at Shreveport, La., in 1905, becoming field agent of the Southern Cotton Growers' Association, which was the outgrowth of the convention. He served in Congress in 1896-1900 and was elected to the United States Senate in 1908 and in 1914.

SMITH, Erminnie Adelle Platt, American ethnologist: b. Marcellus, N. Y., 26 April 1836; d. Jersey City, N. J., 9 June 1886. She was

educated at Willard Seminary in Troy, but continued her studies abroad some years later, and during a residence in Germany was graduated from the School of Mines at Freiburg. In 1878 she was engaged by the Smithsonian Institution to make a study of the languages and customs of the Iroquois Indians, and devoted the remainder of her life to the investigation of that subject. In order that she might gain the most intimate acquaintance with their customs and institutions she became a member of one of their tribes, the Tuscaroras, and in this way familiar with their legends and ideas and habits in general. She died while her Iroquois-English dictionary was being printed.

SMITH, Erwin Frink, American plant pathologist: b. Gilbert's Mills, N. Y., 21 Jan. 1854. He was graduated at the University of Michigan in 1886 and took his Sc.D. there in 1889. He became expert pathologist of the United States Department of Agriculture in 1889 and later had charge of the laboratory of plant pathology of the Bureau of Plant Industry. He is a member of the National Academy of Sciences, was president of the Society of American Bacteriologists in 1906 and of the Botanical Society of America in 1910. He is a trustee of the Marine Biological Laboratory at Wood's Hole, Mass. He was associate editor of the *Centralblatt für Bacteriologie*; contributed to the 'Standard Dictionary'; is author of many scientific papers and of 'Bacteria in Relation to Plant Diseases' (3 vols., 1905-14), etc.

SMITH, Eugene Allen, American geologist: b. Autauga County, Ala., 27 Oct. 1841. He was graduated at the State University of Alabama in 1862, later studying at the universities of Berlin, Göttingen and Heidelberg and took his Ph.D. at Heidelberg in 1868. He was an officer in the Confederate army in 1862-65 and from 1871 was professor at the University of Alabama. He became State geologist in 1873. In 1913 he served as president of the Geological Society of America.

SMITH, Francis Henney, American educator and soldier: b. Norfolk, Va., 18 Oct. 1812; d. Lexington, Va., 21 March 1890. He was graduated from West Point in 1833 and in 1834 was appointed assistant professor there, but resigned from the army in 1836 and was professor of mathematics at Hampden-Sidney College, Virginia, in 1837-39. On the organization of the Virginia Military Institute at Lexington, Va., in 1839, he was appointed superintendent, a position he occupied until January 1890, when he became professor emeritus. During the Civil War he served as colonel in the Confederate army, was in command of the fort at Craney Island, participated in the defense of Richmond in 1864 and of Lynchburg against General Hunter. After the war he at once set about the reconstruction of the institute buildings which had been destroyed by fire and resumed his duties there when it was reopened. He published various textbooks on mathematics and also wrote 'The Best Methods of Conducting Common Schools' (1849); 'College Reform' (1850); 'Report to the Legislature of Virginia on Scientific Education in Europe' (1859), etc.

SMITH, Francis Hopkinson, American artist, author and engineer: b. Baltimore, Md.,

23 Oct. 1838; d. 1915. Educated as a mechanical engineer, he became a contractor and planned and supervised the building of numerous important works, among them the seawall around Governor's Island at Tompkinsville, S. I., the Race Rock lighthouse off New London, Conn., and the foundation for the Statue of Liberty on Bedloe's Island, New York Harbor. But he is also an artist, particularly in water colors and charcoal, earning special praise for his aquarelle sketches of Venice from all viewpoints and under all conditions of atmosphere and light. Again, he is an author, best known for his genial 'Colonel Carter of Cartersville' (1891), which was dramatized by Augustus Thomas and arranged by the author for his public readings. Other volumes by him are 'A White Umbrella in Mexico' (1881); 'A Day at Laguerre's' (1892); 'Gondola Days' (1897); 'Venice of To-day' (1897); 'Caleb West' (1898), and 'The Fortunes of Oliver Horn' (1903); 'At Close Range' (1904); 'Kennedy Square' (1911); 'The Arm-Chair at the Inn' (1912); 'In Dickens' London' (1914); (Felix O'Day' (1915).

SMITH, Sir Francis Pettit, English inventor: b. Hythe, England, 9 Feb. 1808; d. South Kensington, 12 Feb. 1874. From boyhood his interest in boats led him to invent many ingenious devices for their propulsion. In 1836, in entire ignorance of the inventions of Ericsson and Stevens, he constructed a model steamboat propelled by a screw below the water line. His patent for this method of propulsion was obtained six weeks before that of Ericsson. The British admiralty, in spite of the opposition of the engineering world, assisted in the experiments which resulted in the construction of a larger vessel whose trial trip in October 1839 assured the success of the new propeller and its adoption by the British navy in 1844, five years after Ericsson's construction of the first American steam warship. Consult Woodcroft, 'Origin and Progress of Steam Navigation' (1848); Bourne, 'Treatise on the Screw Propeller.'

SMITH, Fred B., American evangelist: b. Lone Tree, Iowa, 24 Dec. 1864. He studied at the State University of Iowa, and later engaged in evangelistic work. In 1898-1913 he was connected with the Young Men's Christian Association, in the service of which he visited the United States army in Cuba in 1898; and traveled throughout the United States in the interests of the association in 1899-1901. He became international secretary in 1910, and was a prominent worker in the "Men and Religion Forward Movement" which resulted in the establishment of more than 1,500 new branches of the association. Since 1914 he has been chairman of the Commission of the Interchurch Federation. Author of 'Men Wanted' (1911); 'A Man's Religion' (1913).

SMITH, Frederick Appleton, American soldier: b. Craigville, N. Y., 15 May 1849. He graduated from the United States Military Academy in 1873, became a captain in 1890, a major in 1899, a colonel in 1902 and a brigadier-general in 1908. As a young man he served in Indian outbreaks in Arizona and the Dakotas. At the breaking out of the Spanish War he was sent to Cuba, where he commanded in the district of Guanajay. After service in

the Philippines he was ordered to Washington and served on the general staff revising the infantry drill regulations. Thereafter he held several posts East and West and was retired in 1913.

SMITH, Frederick M., son of Joseph Smith and grandson of the founder of the Church of Jesus Christ of Latter-Day Saints, sometimes erroneously called Mormons, was born at Plano, Ill., 21 Jan. 1874 and in 1881 moved with his parents to Lamoni, Iowa, where he grew to manhood. He attended the public schools and was graduated from the Lamoni High School. He was the first graduate of Graceland College, Lamoni, Iowa, and has taken advance work at the University of Iowa, Iowa City; the University of Kansas at Lawrence, Kan.; finishing at the Clark University at Worcester, Mass. He became affiliated with the Reorganized Church of Jesus Christ of Latter-Day Saints in his boyhood and has occupied some important offices in this organization. For a short time he filled the office of general historian of the Church by appointment and was by ordination elder, counsellor to the local bishop of Lamoni, Iowa, president of a quorum of elders and counsellor to his father, president of the church. His activities have been divided between his school and church work, but now are to be devoted more exclusively to church service. In addition to the above offices he has been a member and for a time president of the board of trustees of Graceland College. Upon the death of his father in December 1914 he, with his cousin, Elbert A. Smith, of Lamoni, were chosen by the leading authorities of the Church to preside temporarily. At the next General Conference, held in April 1915 he was chosen to permanently occupy as his father's successor in that office and received ordination to that office at Independence, Mo., 5 May 1915. His cousin was installed as his counsellor.

SMITH, George, English historian and theologian: b. Condurrow, Cornwall, 31 Aug. 1800; d. Camborne, Cornwall, 30 Aug. 1868. He was educated at the British and foreign schools at Falmouth and Plymouth and afterward engaged in the manufacturing business, in which he was notably successful. He was well known as a local preacher of the Wesleyan faith and was a student of ability. Author of 'Religion of Ancient Britain to the Norman Conquest' (1844; 3d ed., 1865); 'Sacred Annals' (3 vols., 1847-53); 'History of Wesleyan Methodism' (3 vols., 1857-61; 4th ed., 1865); 'Life and Reign of David' (1868), etc.

SMITH, George, English Assyriologist: b. London, 26 March 1840; d. Aleppo, Asiatic Turkey, 19 Aug. 1876. He was apprenticed to the engraver's trade, but became deeply interested in the Oriental explorations of Layard and Rawlinson and devoted himself in his spare time to the study of Assyrian subjects. His study at the British Museum attracted the attention of Sir Henry Rawlinson, who permitted him access to his workroom there, thus materially assisting him. His first notable achievement was the decipherment of a text fixing the date of the tribute paid to Shalmaneser by Jesu, son of Omri. He later became associated with Rawlinson in the preparation of the third volume of 'Cuneiform Inscript-

tions of Western Asia,' and in 1867 he was appointed assistant in the Assyriology department at the Museum. In 1871 he published 'Annals of Assurbani-pol' transliterated and translated, as well as papers on 'The Early History of Babylonia' and 'The Reading of the Cypriote Inscriptions.' His translation of the Chaldean account of the Deluge was read before the Society of Biblical Archaeology, 3 Dec. 1872 and brought him immediate fame. Sir Edwin Arnold of the *Daily Telegraph* sent him to Nineveh in 1873 for the purpose of finding the missing tablets concerning the Deluge story. Smith secured not only these, but also found the records of the succession and duration of the Babylonian dynasties. In 1874 he returned to Nineveh under the direction of the Museum and succeeded in procuring a large number of tablets belonging to the great Solar Epic, of which the Deluge forms the 11th day, as well as other valuable fragments. He published the results of this expedition in 'Assyrian Discoveries' (1875); and 'Chaldean Account of Genesis' (1876). He set out upon his third expedition to Nineveh in March 1876, secured between 2,000 and 3,000 tablets at Bagdad, but at Kouyunjik found himself debarred from excavating owing to the unsettled condition of the country. He was stricken with fever at Ikisji and was removed to the British Consulate at Aleppo, where he died. Besides the works already mentioned he was author of 'The Phonetic Values of Cuneiform Characters' (1871); 'Ancient History from the Monuments: Assyria' (1875); 'Ancient History from the Monuments: Babylonia' (1877); 'The History of Sennacherib' (1878), etc.

SMITH, George Adam, Scottish theologian: b. Calcutta, 19 Oct. 1856. He was educated in Edinburgh at the University and at New College, studied also in Tübingen and Leipzig, was minister of Queen's Cross Free Church in 1882-92 and in 1892 was made professor of Old Testament language, literature and theology in the United Free Church College at Glasgow. In 1896 he visited the United States as Percy Turnbull lecturer on Hebrew poetry at the Johns Hopkins University and in 1899 as Lyman Beecher lecturer at Yale University. His writings in book form are 'The Book of Isaiah' (1888-09); 'The Preaching of the Old Testament to the Age' (1893); 'Historical Geography of the Holy Land' (1894; 7th ed., 1901); 'The Twelve Prophets' (1896-97); a 'Life of Henry Drummond' (1898; 6th ed., 1902), and 'Modern Criticism and the Preaching of the Old Testament' (1901).

SMITH, George Barnett, English author: b. Ovenden, near Halifax, Yorkshire, 17 May 1841. In 1864, after a secondary schooling at Halifax, he went to London, where he was employed on the staff of the *Globe* and the *Echo*, published a book of verse in 1869, and became a contributor to the leading British reviews. Among his further volumes are 'Poets and Novelists,' critiques (1875); 'Shelley' (1877); a 'Life of Bright' (1881); 'Victor Hugo' (1885); 'William I and the German Empire' (1887), and a work on 'The United States' (1896-97). He is also an amateur etcher of some ability.

SMITH, George Murray, English publisher: b. London, 19 March 1824; d. Wey-

bridge, Surrey, 6 April 1901. He entered the counting-house of his father, senior partner of the firm of Smith, Elder and Company, India merchants and publishers, became manager of the publishing department and after his father's death assumed control of the entire business, including banking and the agency of the Overland route to India. He published the works of Charlotte Brontë, Ruskin, Darwin and Thackeray, founded the *Cornhill Magazine* in 1859 with the latter as editor and contributor, published in it George Eliot's 'Romola' and in 1865 he founded the *Pall Mall Gazette* with Frederick Greenwood as editor. The banking business was ultimately transferred to other hands, Smith, Elder and Company retaining the publishing interests and continuing to issue the works of the leading English authors. They were publishers for Robert Browning and Matthew Arnold and were granted the privilege of publishing Queen Victoria's 'Leaves from the Journal of Our Life in the Highlands' and 'Early Years of the Prince Consort,' as well as Sir Theodore Martin's 'Life of the Prince Consort.' Perhaps the most notable achievement of Smith's life was the publication of the 'Dictionary of National Biography' (63 vols., 1885-1900) which was followed by a supplement (3 vols., 1901) to which is prefixed a memoir of the publisher's life by the editor, Sidney Lee.

SMITH, George Otis, American geologist: b. Hogdon, Me., 22 Feb. 1871. He was graduated at Colby College in 1893 and took his Ph.D. at Johns Hopkins University in 1896. He was engaged in geological work in Michigan, Utah, Washington and New England from 1893; was connected with the United States Geological Survey from 1896, became assistant geologist in 1901, and after serving as geologist in 1901-07 he became director of the survey. He was president of the Washington Geological Society in 1909, and is author of many papers and reports in connection with his work.

SMITH, George Williamson, American educator: b. Catskill, N. Y., 21 Nov. 1836. He was graduated from Hobart College in 1857, was principal of the Bladensburg Academy, Maryland, in 1858-59, and in 1861-64 was clerk of the United States Navy Department while studying theology. He was ordained to the Protestant Episcopal priesthood in 1864, was chaplain in the United States navy in that year and in 1864-65 was acting professor of mathematics at the United States Naval Academy at Newport. He was chaplain at the Naval Academy at Annapolis in 1865-68, on the United States steamship *Franklin* in 1868-71, rector of Grace Church, Jamaica, Long Island, N. Y., in 1872-81, and of the Church of the Redeemer, Brooklyn, N. Y., in 1881-83; president of Trinity College, Hartford, Conn., 1883-1904; emeritus professor of metaphysics since 1904; and from 1905 associate minister Saint John's Church, Washington.

SMITH, Gerrit, American philanthropist, reformer and statesman: b. Utica, N. Y., 6 March 1797; d. New York, 28 Dec. 1874. He was graduated from Hamilton College in 1818, subsequently devoted himself to the management of his great landed estate in central and northern New York, and was very successful in matters of his business. His credit is indi-

cated by a well-known anecdote of the financial panic of 1837. In need of ready money, he obtained from John Jacob Astor a loan of \$250,000, agreeing to execute mortgages on certain tracts of land as security. The mortgages were duly executed, but were not forwarded by the county clerk. Astor had loaned a quarter of a million on the basis of a verbal arrangement only, and for weeks remained satisfied. To many, Smith was known simply for his wealth and his use of it. During his life he gave away more than \$8,000,000. His name was at the head of almost every subscription list of the time. A large portion of his benefices fell to various established institutions, but much also to private charities in checks large and small. In 1846 he made a gift of 3,000 deeds, each for from 40 to 60 acres of land, to black and white poor. His efforts thus to further negro colonization in the North were unfortunately not successful, owing in part to the fact that the lands were unsuited to agriculture, but more to the fact that the negroes were as yet unfitted for independent farming. In 1825 Smith became a member of, and generous contributor to, the American Colonization Society, but withdrew from it in 1835 upon becoming convinced that it had nothing at all to do with the promotion of the anti-slavery cause in the United States, and joined the Anti-Slavery Society, of which he was thereafter a leading member. His object was the development of a public opinion that would demand abolition. By extensive correspondence, by frequent speeches, and by large gifts of money he furthered the movement of which he was, indeed, a most zealous exponent, but perhaps somewhat more genial than many. He assisted in the operation of the "underground railway"; and he furnished money to John Brown, though not implicated, as was alleged, in the Harper's Ferry attack. In politics Smith of course followed his reformatory views, and had no interest in party maneuvering. By politicians generally he was naturally considered an "intractable visionary." He was defeated for the State senate in 1831. Under his leadership the Liberty party was formed at Arcade, Wyoming County, N. Y., 29 Jan. 1840; his idea was that neither of the two great parties was fitted to deal with slavery, but his purpose was general political reform and not simply abolition, as was popularly understood. The party never had great strength, its constituency being neither well organized nor well directed for party ends. By 1860 it was virtually dead. Smith was its candidate for the Presidency in 1848 and 1851. The "Industrial Congress" at Philadelphia nominated him for the Presidency in 1848, the Land Reformers in 1856; both nominations were declined. He was an unsuccessful candidate for governor of New York in 1858 on the Anti-Slavery ticket. In 1853 he was elected to Congress by a plurality as an "Independent." He served one session and then resigned, after having made several clear and decided speeches, one a powerful attack on the "Nebraska bill" 6 April 1854. During the Civil War he vigorously supported the government, but after it, holding that the North was not blameless in the matter of slavery, counseled moderation toward the South, and in accordance with this view went on the bail-bond of Jefferson Davis with Horace Greeley, and

interceded in behalf of "Ku-Klux" prisoners at Albany. Subsequently he was active in various measures, among them the assistance of Mazzini, the Italian patriot. He withdrew from the Presbyterian Church, and built an edifice at Peterboro for a non-sectarian congregation, before which he sometimes preached. Smith was much persecuted, like most of those who in a prominent way disregard expediency and circumstance. Garrison, often at odds with him, wrote after his death: "His case is hardly to be paralleled among the benefactors of mankind in this or any other country." Smith's more important writings are 'Speeches in Congress' (1856); 'Sermons and Speeches' (1861); 'The Theologies' (1866); 'Nature's Theology' (1867); 'Letter from Gerrit Smith to Albert Barnes' (1868). Consult the biography by Frothingham (1878).

SMITH, Gerritt, American composer and organist, grandnephew of the preceding: b. Hagerstown, Md., 11 Dec. 1859; d. 1912. He studied music abroad, was organist in Saint Paul's Cathedral at Buffalo, N. Y., and Saint Peter's Church at Albany, N. Y. From 1885 he was organist of the South Church, Madison avenue, New York, where he gave nearly 300 free recitals. He was professor of music at Union Theological Seminary, honorary president of the Guild of American Organists, and a well-known writer on musical topics, his compositions including over 75 songs and instrumental pieces and the cantata 'King David.'

SMITH, Goldwin, English scholar and author: b. Reading, Berkshire, 13 Aug. 1823; d. Toronto, 7 June 1910. He was graduated from Oxford (University College) in 1845, became Fellow of his college in 1847, was called in that year to the bar at Lincoln's Inn, in 1850 was made assistant secretary of the royal commission on the state of Oxford University, and in 1858-66 was regius professor of modern history at Oxford. His lectures on Cromwell claimed attention and aroused controversy. In 1862-65 he co-operated with Bright in exerting his influence in favor of the American Union, by speeches, by signed articles and by anonymous contributions on politics to the *Saturday Review*, then very powerful. From 1868 to 1871 he was professor of English and constitutional history in Cornell University, but then removed to Toronto, Canada, where he edited the *Canadian Monthly* (1872-74), and founded *The By-stander* (no longer published) and *The Week*. He was a consistent advocate of the annexation of Canada to the United States, his 'Canada and the Canadian Question' (1891) being a valuable hand-book of argument. His 'United States: An Outline of Political History 1492-1871' (1893) is an excellent work. Among his other volumes are 'Lectures on the Study of History' (1861); 'The Empire' (1863); 'Irish History and Irish Character' (1863); 'Three English Statesmen' (Pym, Cromwell, Pitt) (1867); 'Cowper' ('English Men of Letters' 1880); 'The Moral Crusader, William Lloyd Garrison' (1892); 'Bay Leaves' (renderings from Latin poets) (1893); and 'Essays on Questions of the Day' (1894; rev. ed. 1904); 'My Memory of Gladstone' (1903). In his many contributions to periodicals he was known for his philosophical interpretation of current political and social phenomena. His writings show

great impartiality and literary skill. Consult 'Reminiscences' ed. by Haultain, T. A. (New York 1910); also Haultain, T. A., 'Goldwin Smith: His Life and Opinions' (London 1913).

SMITH, Green Clay, American congressman and Baptist clergyman: b. Richmond, Ky., 2 July 1832; d. Washington, D. C., 29 June 1895. He was graduated from Transylvania University in 1850, and admitted to the bar in 1853. In 1860 he was elected to the Kentucky legislature, but resigned this office to take active part in the Civil War. He was promoted colonel in the Union army in 1862, and brigadier-general of United States volunteers in the following year. Resigning his commission he sat in the 38th and 39th congresses and in 1866 became governor of the Territory of Montana. He retired from political life to study for the ministry in 1869, was pastor of a Baptist church in Frankfort, Ky., and in 1876 the candidate of the Prohibition Party for President of the United States. He was at the time of his death pastor of the Metropolitan Baptist Church of Washington, D. C.

SMITH, Gustavus Woolson, American army officer: b. Scott County, Ky., 1 Jan. 1822; d. New York, 23 June 1896. He was graduated from the United States Military Academy in 1842 and assigned to duty at Fort Trumbull, in whose construction he assisted. He was assistant professor of engineering at West Point from 1844 to 1846, but was transferred to active service in the war with Mexico. He was brevetted captain 20 Aug. 1847, and was engaged in the siege of the City of Mexico in the following month. In 1861 he entered the Confederate army and at the expiration of the war retired to private life. He published 'Confederate War Papers' (1883); and 'Battle of Seven Pines' (1891).

SMITH, Hannah Whitall, American Quaker and philanthropist: b. Philadelphia, 1832; d. 1 May 1911. She was educated at the Quaker school of Miss Longstroth and in 1851 was married to Robert Pearsall Smith, also a Quaker. She conducted Bible classes for women at her home in Philadelphia, which she made a headquarters for various religious projects. In 1873-74, with her husband, she conducted a series of religious meetings in England. In 1888 she removed with her family to England and lived in London the remainder of her life. She was well known as a speaker on religious and other subjects, and was an ardent worker for temperance and woman suffrage. Author of 'The Unselfishness of God' (1903); 'The Christian's Secret of a Happy Life' (1908), etc.

SMITH, Harry Bache, American playwright: b. Buffalo, N. Y., 1860. Before writing for the stage he spent some years as literary and dramatic critic for the newspapers of Chicago. He is the librettist of a number of well-known light operas, the most popular among which are 'Robin Hood'; 'The Little Corporal'; 'The Tar and the Tartar'; 'Foxy Quiller'; 'Boccaccio'; 'The Viceroy,' etc.

SMITH, Sir Henry Babington, British financial expert: b. Jordan Hill, Renfrewshire, Scotland, 29 Jan. 1863. He was educated at Trinity College, Cambridge. He was private secretary to the Earl of Elgin, Viceroy of India,

in 1894-99; representative of the Treasury at Natal in 1899; government representative on various missions connected with the postal and telegraph services; secretary to the Post Office in 1903-09; and in 1909 became president of the National Bank in Turkey. He was a member of the financial mission to the United States in the interests of the Anglo-French loan in 1915; and later in 1915 he was appointed chairman of the Royal Commission on Civil Service.

SMITH, Henry Boynton, American theologian: b. Portland, Me., 21 Nov. 1815; d. New York, 7 Feb. 1876. He was graduated from Bowdoin in 1834, studied theology at Andover and at Bangor, and subsequently in Halle and Berlin. He became pastor of the Congregational church at West Amesbury, Mass., in 1842, but in 1847 accepted the chair of mental and moral philosophy at Amherst. He was professor of church history in Union Theological Seminary, New York, in 1850-55, and occupied the chair of systematic theology there 1855-73, after which he became professor emeritus. He founded the *American Theological Review* in 1859 and edited it until 1862 when it was merged in the *Presbyterian Review*, of which he was editor until 1871. He was the author of 'The Relations of Faith and Philosophy' (1849); 'An Argument for Christian Churches' (1857); 'History of the Church of Christ in Chronological Tables' (1859); and edited and partially translated Gieseler's 'Church History' (5 vols., 1859-63); translated Hagenbach's 'History of Christian Doctrine' (1861-62), etc. Consult 'Memoirs,' edited by his wife (1881); and the biography by Stearns (1892).

SMITH, Henry Hollingsworth, American surgeon: b. Philadelphia, Pa., 10 Dec. 1815; d. there, 11 April 1890. He was graduated at the University of Pennsylvania in 1837, and afterward studied in Europe. He was engaged in practice at Philadelphia, after 1841, was surgeon in several hospitals there, and in 1855-71 he was professor of surgery at the University of Pennsylvania, after which time he was professor emeritus there. He was appointed surgeon-general of Pennsylvania upon the outbreak of the Civil War, and organized the hospital department of the State. He originated the plan of removing the wounded from the battlefields to the hospitals of Philadelphia, Harrisburg, Reading and other cities, and put into practice the embalming of the dead on the battlefields. After thoroughly organizing the military hospital service of the State he retired in 1862. Author of 'System of Operative Surgery' (2 vols., 1852); 'Practice of Surgery' (2 vols., 1857-63), etc.

SMITH, Henry John Stephen, Irish mathematician: b. Dublin, 2 Nov. 1826; d. 3 Feb. 1883. He was graduated from Balliol, Oxford, in 1850, and the same year began to lecture on mathematics there and continued in this lectureship until 1873. In 1860 he was also appointed to the Savilian chair of geometry at Balliol. His development of the theory of numbers placed him among the greatest mathematicians of his day. He is also known for his demonstrations of a great number of advanced theorems in higher mathematics. His mathematical papers were collected in 1894 in two

volumes, to which was prefixed a biographical sketch by Charles H. Pearson (q.v.).

SMITH, Henry Preserved, American educator: b. Troy, Ohio, 23 Oct. 1847. He was graduated from Amherst in 1869, studied at Lane Theological Seminary, Cincinnati, Ohio, in Berlin and in Leipzig, and in 1864 was ordained in the Presbyterian Church. He occupied a chair at the Lane Theological Seminary in 1877-73, which he resigned because of the charge of heresy brought against him by the Cincinnati Presbytery. He was convicted of the charge by both the Presbytery and the General Synod and thereupon retired from the Presbyterian Church. In 1898 he became professor of biblical literature in Amherst College was received into the Congregational ministry. From 1907 to 1913 he was professor of Old Testament literature and the history of religions in the Meadville (Pa.) Theological School. Since 1913 he has been librarian of Union Theological Seminary, New York City. He has published 'Inspiration and Inerrancy' (1893); 'The Bible and Islam' (1897); 'Commentary on the Books of Samuel' (1899); 'Old Testament History' (1903); 'The Religion of Israel' (1914).

SMITH, Hoke, American statesman: b. Newton, N. C., 2 Sept. 1855. He was educated in a preparatory school conducted by his father, Hosea H. Smith, LL.D., at Chapel Hill, and admitted to the bar in 1873. In 1887 he purchased the *Atlantic Journal*, and was a strong supporter of President Cleveland. In Cleveland's second term he served as Secretary of Interior from 1893-96. In the latter year he was elected governor of Georgia, running on a reform ticket. He was defeated for re-election in 1910, but again elected in 1911. Shortly thereafter he was called to the United States Senate and re-elected in 1915 to serve six years. He has been very active in legislation, and is regarded as one of the strong men of the Democratic party.

SMITH, Horatio (always called HORACE), and **James**, English authors: b. London, 31 Dec. 1779 and London, 10 Feb. 1775; d. Tunbridge Wells, 12 July 1849, and London, 24 Dec. 1839. James Smith became solicitor to the board of ordnance, and Horace a stock-broker. Being both of a literary turn, the brothers became contributors to the *Pic Nic* newspaper, founded in 1802, and from 1807 to 1810 contributed numerous papers to the *Monthly Mirror*, among these the 'Imitations of Horace,' which were afterward published separately. In 1812 the competition offered by the management for the best address to be read at the opening of Drury Lane Theatre, when rebuilt after the fire, suggested to the Smiths the idea of producing a collection of parodies of the most noted writers of the day, under the title 'Rejected Addresses.' The work on being issued was hailed with the most enthusiastic applause, and rapidly ran through numerous editions. Its popularity still continues great, and deservedly, for few *jeux d'esprit* are more happy than the burlesques of the poetry of Wordsworth, Crabbe and Sir Walter Scott (undoubtedly the best; Scott said of it, "I certainly must have written this myself, although I forget upon what occasion"), the pompous prose of Johnson, or the bluntness of Cobbett. Jef-

freys said he took the 'Addresses' to be the "very best imitations, and often of difficult originals, that ever were made." Calverley alone has equaled them. James, satisfied, did no more literary work save a few comic songs and some *vers de société*; but Horace set himself to the writing of novels, and produced among others 'Brambletye House' (1826); 'Reuben Apsley' (1827); 'The Moneyed Man' (1841); 'Adam Brown' (1843).

SMITH, Isaac Townsend, American banker: b. Boston, 12 March 1813; d. New York city, 30 March 1906. He entered commercial life as supercargo, making several East India voyages in 1834-38. He afterward settled in New York as merchant and ship owner; then became one of the incorporators and for many years president of the Metropolitan Savings Bank. He was during 1878-84 commissioner of immigration for the State of New York; and acted as presidential elector at the re-election of Abraham Lincoln in 1864. At the opening of commercial relations between Siam and the United States in 1845 he became financial agent for Siam, and served in that capacity or as consul and consul-general at New York till his death.

SMITH, Jacob Hurd, American soldier: b. Jackson, Ohio, 29 Jan. 1840. He was graduated at the Collegiate and Commercial Institute, New Haven, Conn., in 1858. He enlisted in the Union army in May 1861 and attained the rank of captain. He afterward served in Indian frontier warfare and in the war with Spain. He was promoted colonel in 1899, brigadier-general of volunteers in 1900, and received that rank in the regular army on 1901. He held an excellent record in the service, but while in command of the sixth separate brigade in Samar, Philippine Islands, he was alleged to have issued orders of unwarranted severity in the warfare against the Philippine insurgents. He was court-martialed 21 April 1902, and was retired from active service 17 July 1902 with a reprimand from President Roosevelt.

SMITH, James, American legislator and signer of the Declaration of Independence: b. Ireland, about 1720; d. York, Pa., 11 July 1806. He came to America with his father in 1829, and was educated at the College of Philadelphia. He engaged in law practice and surveying at Shippensburg, and later became the only practitioner of law at York, Pa. He took a prominent part in the early revolutionary movement in Pennsylvania, raised the first volunteer company in the State for the purpose of resisting British authority, and considerably accelerated the patriot movement through his essay 'On the Constitutional Power of Great Britain over the Colonies in America.' He was a delegate to the Pennsylvania Convention in January 1775, to the Provincial Conference in June 1775; and as a member of the Continental Congress, in which he served in 1775-78, he signed the Declaration of Independence. He was a member of the Pennsylvania State Constitutional Convention in 1776, served in the State assembly in 1779, was judge of the High Court of Appeals in 1780, and was appointed brigadier-general of the Pennsylvania volunteers in 1782. He was a friend and staunch supporter of Washington, and

sacrificed his personal fortune in the Revolutionary cause.

SMITH, James, American pioneer: b. Franklin County, Pa., 1737; d. Washington County, Ky., 1812. He was captured by Indians at the age of 18, was adopted into one of their tribes and was held by them for four years before he escaped. He was leader of the "Black Boys," a company formed for Indian warfare in 1863; and was a lieutenant under Gen. Henry Bouquet in the expedition against the Ohio Indians in 1764. He was one of the pioneer settlers of Westmoreland County, Ky., in 1768, first accompanying a band of explorers into that territory in 1766. He was a member of the Pennsylvania Convention in 1776, and served in the Pennsylvania assembly in 1776-77. He commanded a scouting party against the Indians in the Jerseys in 1777, and later in that year was commissioned colonel in command of the warfare on the frontiers. After 1788 he lived near Paris, Ky., and served for many years in the State legislature. He was author of 'Remarkable Adventures in the Life and Travels of Col. James Smith' (1799; new ed. 1870); 'A Treatise on the Mode and Manner of Indian Warfare' (1804).

SMITH, James Argyle, American military officer: b. 1 July 1831; d. Jackson, Miss., 6 Dec. 1901. He was graduated from the United States Military Academy in 1853, but at the outbreak of the Civil War joined the Confederate army, and was promoted brigadier-general in 1863. From 1878 to 1882 he was superintendent of education of the State of Mississippi. Eleven years later he was restored to the United States army, and during the next four years was on duty at various army posts in the West.

SMITH, James Francis, American soldier and judge: b. San Francisco, 28 Jan. 1859. His education was gained at Santa Clara College and Hastings Law School. He was admitted to the bar in 1881. He enlisted at the outbreak of the Spanish War and was made colonel of the First California regiment, United States volunteers, joining the first expedition to the Philippine Islands. He participated in the taking of Manila, 13 Aug. 1898, and was made president of the military commission there the following year; he was also a member of the commission that conducted a conference with Aguinaldo. He fought later at Santa Ana, San Pedro Mecati, Paternos and Lagnig, and was commended for gallantry. In April 1899, he was advanced to brigadier-general, and held commands of the department of Visayas, was military governor of the Island of Negros, and (1900) collector of customs for the Philippine Archipelago. Being honorably discharged from the service in 1901 he was appointed justice of the Supreme Court of the Philippine Islands, 17 June 1901. Later he was made governor-general of the islands, but resigned in 1909, and returned to the United States. In 1910 he was made associate justice of the United States Court of Customs Appeals in San Francisco.

SMITH, Jessie Wilcox, American artist: b. Philadelphia, Pa., 19th century. She studied at the Philadelphia Academy of Fine Arts and under Howard Pyle at the Drexel Institute. She has been engaged in book and magazine illustrating since 1890 and is well known for her clever and sympathetic delineation of child

life. Her work has appeared in *Harper's Magazine*, *Scribner's Magazine*, *Collier's Weekly*, the *Ladies' Home Journal* and other periodicals, as well as in books published by Houghton, Mifflin and Company and by Little, Brown and Company. Mention may be made of the series 'The Child's World'; 'The Five Senses'; 'Seven Ages of Childhood'; and her illustrations for the 'Mother Goose Rhymes.'

SMITH, John, English soldier and colonist, founder of Virginia: b. Willoughby, Lincolnshire, 1580; d. London, June 1631. In 1596 he enlisted in the French army to fight against Spain, but after the peace in 1598 transferred his services to the insurgents in the Netherlands, and there remained until about 1600. After study of the theory of warfare and practice in the cavalry exercises of the time, he started on a career of marvelous adventure, performing very many exploits, for which his own narratives are the only authority. Having shipped, he says, from France for Italy, he was thrown overboard as a Protestant, but ultimately was rescued by a pirate, and after receiving a share of booty from a Venetian prize, went through Italy and Dalmatia to Styria, and enlisted in the forces of the Archduke of Austria against the Turks. He places emphasis upon his ingenuity in the device of a system of signaling by means of which the imperial army was enabled to communicate with the invested garrison of Limbach and thus raised the siege. After having killed three Turkish champions in a series of duels before the assembled armies, he was at last taken prisoner at Rotenturm, and sold as a slave. But he escaped, and finally got to Morocco, whence he returned in an English warship to England in 1605. Fuller ('Worthies of England') thought of these "strange performances" that their scene was "laid at such a distance they are cheaper credited than confuted." Later investigators allow them some basis of truth. When Smith got back he busied himself in the schemes of colonization in the New World which were being undertaken in consequence of the recent discoveries. An enterprise with which he was identified for a settlement in Guiana fell through, and he then sailed from Blackwall, 19 Dec. 1606 among the 105 emigrants who, under royal patent, were to establish a colony in Virginia. In the passenger-list he is styled a planter. The expedition of three vessels went by way of the West Indies, reached the coast of Virginia on 26 April, and then opened the sealed instructions containing the list of members of the council. Among them was Smith, who was not at first permitted to act because during the voyage for some reason unknown he had been placed under arrest by Captain Newport, commander of the fleet. On 13 May 1607 the colonists landed about 50 miles from the mouth of the river they called the James, at a peninsula on its northern bank, where they built Jamestown. The site was strongly approved by Smith, though opposed by Bartholomew Gosnold, another of the council. From the start Smith was active in the work of the colony, and on 10 June he was admitted to office. Fortifications were built, and then he made excursions into the surrounding region for food. He proved an excellent leader, and soon became virtually the director of the colony.

During one of his journeys he was taken prisoner by the Indians (December 1607), but later released on promise to furnish a ransom of "two great guns and a grindstone." In an interpolation in his 'Generall Historie (1624), Smith says that it was during this captivity that he was saved from death by Pocahontas (q.v.). Charles Deane (q.v.), the antiquary, in his edition (1860) of Wingfield's 'Discourse,' was the first to point out that the story was at variance with Smith's narratives in the tracts composing the book when they were published contemporaneously with the events they recorded. But Smith has found many defenders, such as Arber in his memoir in the 'Encyclopædia Britannica' (9th ed. 1887) and his edition (1884) of Smith's 'Works,' and Poin-dexter in 'Captain John Smith and his Critics' (1893). The matter, like Smith's general veracity, remains an object of controversy. Wingfield, the first elected president of the colony, was deposed in September 1607, Smith taking a leading hand in the business. Ratcliffe, the successor, held office a year, and 10 Sept. 1608 Smith was made formal head. He enforced discipline, strove to correct the unthrifty methods of the colonists, had them build a church, strengthen the defenses, and make some provision for agriculture and fishery. He made two voyages, covering in all, he reckoned, 3,000 miles, about the coasts of Chesapeake Bay, which he mapped with its environs. A new party of colonists arrived in August 1609. Smith refused to surrender the government of the colony, and the newcomers chose Francis West president. Smith's term having later expired, George Percy was elected and West made a councillor. About 29 September Smith left for England. He never returned to Jamestown. He left the colony in a most favorable condition. In 1614 he made a voyage of exploration to New England and prepared a map of the coast from the Penobscot to Cape Cod, the first properly to indicate the outline of it. He made two attempts in 1615, being frustrated in the first by a storm and in the second by being taken prisoner by the French. In 1617 he started again, but bad weather kept him in port, and he retired to London where he made maps and wrote pamphlets. Smith was certainly a prominent figure of his time, and whatever his tendency to embellishment and imagination as a historian, he really achieved much in Virginia. He was a good example of Elizabethan versatility, "bookman, penman, swordsman, diplomat, sailor, courtier, orator." His service to America in the early 17th century remains the greatest part of his career. His most important works are 'True Relation' (1608; ed. by Deane, C., Boston 1867); 'Maps of Virginia' (1612); 'Description of New England' (1616); 'New England's Trials' (1620). Consult Arber, E., 'Complete Works of Captain John Smith' (Birmingham 1884; London 1895); Ashton, J., 'Adventures and Discoveries of Captain John Smith' (New York 1883); Bradley, A. G., 'Captain John Smith' (New York 1905); Jenks, T., 'Captain John Smith' (New York 1904); Smith, E. B., 'Pocahontas and Captain John Smith' (Boston 1914); Warner, C. D., 'Life of Captain John Smith' (New York 1881); Wertenbaker, T. J., 'Virginia under the Stuarts' (Princeton 1914). See JAMESTOWN.

SMITH, John Bernhardt, American entomologist: b. New York, 21 Nov. 1858; d. 12 March 1912. He was admitted to the bar in 1879, but subsequently turned to the study of entomology, and in 1884 was appointed a special agent of the United States Department of Agriculture. He became assistant curator of the United States National Museum in 1886; was appointed State entomologist of New Jersey in 1888 and from 1889 he was professor of entomology at Rutgers College and entomologist at the New Jersey Agricultural Experiment Station. He became widely known in the course of his work in charge of the New Jersey campaign for the extermination of its mosquitoes, for which an appropriation of \$350,000 was voted; and did noteworthy work in connection with the fight against the San José scale. Author of 'Economic Entomology for Farmer and Fruit Grower' (1896); 'Our Insect Friends and Enemies' (1909), etc.

SMITH, John Lawrence, American chemist and physician: b. Charleston, S. C., 17 Dec. 1818; d. Louisville, Ky., 12 Oct. 1883. He was educated at the University of Virginia and the South Carolina Medical College, studied chemistry in Europe with Liebig and Pelouze, and established in 1846 the *Medical and Surgical Journal of South Carolina*. He was appointed bullion assayer by the State of South Carolina; and in 1846 entered the service of the Turkish government to report upon the cotton culture and the mineral resources of Turkey. He returned to America in 1850 and taught chemistry in the medical department of the University of Louisville 1854-66. He made one of the largest known collections of meteorites, which after his death was acquired by Harvard University. He received decorations from the French, Turkish, and Russian governments; in 1874 was president of the American Association for the Advancement of Science; in 1877 of the American Chemical Society, and in 1879 succeeded Sir Charles Lyell as corresponding member of the Academy of Sciences of the Institute of France. The more important of his numerous published papers were issued by him as 'Mineralogy and Chemistry, Original Researches' (1873-84).

SMITH, John Talbot, American Roman Catholic clergyman, author and lecturer: b. Saratoga, N. Y., September 1855. He was graduated from Saint Michael's College, Toronto, Canada, 1881; missionary in the Adirondacks 1881-89, editor of the *New York Catholic Review* 1889-92, president of the Catholic Summer School 1905-09, and founded the Catholic Actors' Guild of America 1914. He has published the novels, 'A Woman of Culture' (1881); 'Solitary Island' (1886); 'His Honor the Mayor' (1891); 'Saranac' (1893); 'The Art of Disappearing' (1905); 'The Black Cardinal' (1914); also 'The History of the Ogdensburg Diocese' (1884); 'The Training of a Priest' (1896); 'Life of Brother Azarias' (1897); 'History of the Diocese of New York' (1905); and two volumes of sermons.

SMITH, John Walter, American senator: b. Snow Hill, Md., 5 Feb. 1845. He was educated at Washington Academy. As a member of the Democratic party he was elected to the Maryland State senate in 1888, serving there

till 1899; in 1894 he was president of the senate; and in 1895 chairman of the Democratic State Committee. In 1896 he was nominee for the United States Senate, and 1899-1901 was member of Congress. From 1900-04 he was governor of Maryland, and from 1909 was United States Senator.

SMITH, James Waldo, civil engineer: b. Lincoln, Mass., 9 March 1861. His education was obtained at Phillips Academy, Andover, and the Massachusetts Institute of Technology. After serving as chief engineer of the waterworks of his own town, though barely 17, he assisted in various engineering works connected with water supply, and in 1892 was placed in charge of the Passaic (N. J.) Water Company. Having had successful experience in developing the water supplies of several cities in New Jersey he was in 1903 chosen chief engineer of the aqueduct commissions of New York, and under his direction the plans were worked out for the Catskill water supply, to deliver 500,000,000 gallons of water daily in New York city at high pressure. This gigantic work cost about \$170,000,000, and was successfully completed. See CATSKILL.

SMITH, Joseph, American Mormon leader: b. Sharon, Windsor County, Vt., 23 Dec. 1805; d. Carthage, Ill., 27 June 1844. In 1820 when living as a farm laborer at Manchester, Ontario (now Wayne) County, N. Y., at the time of a religious revival he prayed, according to his own account, for guidance, and was told by two heavenly messengers not to join any sect. On 21 Sept. 1823 an angel, that he called Moroni, told him of a book engraved on gold plates and containing the "fulness of the everlasting gospel." He was instructed to dig for the plates in the hill Cumorah, four miles from Palmyra, between that town and Manchester. These plates, the characters on which were in a tongue styled "reformed Egyptian," Smith translated by means of interpreters (Urim and Thummim) found with the plates, and with the assistance of amanuenses who received his dictation. Smith received the priesthood of Aaron from John the Baptist and of Melchizedek from Peter, James and John. On 6 April 1830 the Mormon Church was organized at Fayette, Seneca County, N. Y., and Smith was recognized as the prophet of a new dispensation. (For subsequent details of Smith's career see MORMONS). While residing at Nauvoo, Ill., the feeling against him resulting from religious and political differences, culminated in his murder by a mob, which broke into the jail at Carthage, where he had been placed for safe-keeping after surrendering for trial upon certain charges preferred against him at the instance of personal enemies, seceders from the Church that he had founded.

SMITH, Joseph (son of Joseph Smith who was instrumental in organizing the Church of Jesus Christ of Latter Day Saints, at Fayette, New York, 6 April 1830): b. Kirtland, Ohio, 6 Nov. 1832; d. Independence, Mo., 10 Dec. 1914. He resided with his parents at Kirtland, Ohio, until their removal to Far West, Missouri, in 1838. Within a year afterward when his father was arrested by a drunken militia, this boy was thrust from his father at the point of the bayonet and rudely told that he would see his father no more.

In the winter of 1838-39 he accompanied his mother into Illinois, banished from the State under the edict of Governor Lilburn W. Boggs of Missouri. He and his adopted sister crossed the ice of the Mississippi River at Quincy, Ill., clinging to his mother's skirts while she carried his two younger brothers in her arms. After his father joined the family near Quincy, Ill., they settled at Commerce, subsequently called Nauvoo, Ill. Here he witnessed the years of prosperity of the family, also the severe persecution which resulted in the death of his father at the hands of a mob at Carthage, Ill., 27 June 1844.

At Nauvoo he was reared to manhood and spent his early years honored and respected and was several times trusted by his fellow citizens in the office of justice of peace. On the 6 April 1860 at a conference of the Reorganized Church of Jesus Christ of Latter Day Saints held at Amboy, Ill., he was chosen as president of that Church. His presidency of over half a century was exercised with patience and the respect of his people and no breath of suspicion against his moral integrity was ever heard. President Smith was three times married; first in 1856 to Miss Emaline Griswold who died in 1869, subsequently to Miss Bertha Madison who died in 1896, and then to Miss Ada Clarke who survived him but who has since died. The fruit of these three unions was 17 children, 10 of whom are still living, six sons and four daughters. He died at Independence, Mo., 10 Dec. 1914, honored and respected as a consistent leader and near companion by church associates; and by fellow citizens as a loyal, upright and valuable citizen of town, county and State. See REORGANIZED CHURCH OF JESUS OF LATTER DAY SAINTS.

SMITH, Joseph Fielding, American religious leader, president of the Church of Jesus Christ of Latter Day Saints, nephew of Joseph Smith (1805-44): b. Far West, Caldwell County, Mo., 13 Nov. 1838; d. Salt Lake City, Utah, 19 Nov. 1918. His childhood was spent amid persecutions and hardships which finally resulted in the martyrdom of his uncle and his father at Carthage, Ill., 27 June 1844. In 1846 his mother with her family left her home in Nauvoo, Ill., as an exile, with the majority of the Latter Day Saints, who were driven from their homes. In this exodus, Joseph drove an ox-team to Winter Quarters, on the Missouri river, where the family remained until the spring of 1848, when they continued their journey to the west. From Winter Quarters to Salt Lake Valley, Joseph drove two yoke of oxen attached to a heavy-laden wagon, a distance of more than 1,000 miles, and arrived in the valley 23 Sept. 1848. He was engaged in manual labors 1848-54, and in the last-named year went as a missionary to the Hawaiian Islands, where he remained until 1857, gaining a thorough knowledge of the native tongue. He returned to Utah in 1858 and on 21 March 1858 was ordained to the office of a Seventy, and on 16 October of the same year to the office of a High Priest and member of the High Council of the Salt Lake State. He labored as a missionary in Great Britain 1860-63 and in 1864 returned to the Hawaiian Islands on his second mission, where he resided until

his return to Utah in 1865. While on his third mission to the Hawaiian Islands, 1885-87, he became acquainted with Prof. L. L. Rice, the possessor of the original manuscript of the much famed "Spaulding Story" which many over-zealous anti-"Mormons" have tried in every possible way to connect with the Book of Mormon, and from him he obtained an exact copy of the manuscript, which being published in book form, effectually disproved the Spaulding theory, according to Pres. James H. Fairchild, of Oberlin College, who compared the two productions. On 1 July 1866 he was ordained an apostle and was received into the quorum of the Twelve Apostles 6 Oct. 1867. In February 1874 he started on his second mission to Europe, this time to preside over the European mission and to edit the *Millennial Star*, the Church periodical in England. He remained there until the fall of 1875, when he returned to Utah and was appointed to preside over the Latter Day Saints in Davis County. This position he held until the spring of 1877 when he was again appointed to preside over the European mission, and for the third time left for Great Britain. He traveled in this field, visiting the different branches in England and on the Continent, until the death of President Brigham Young, 29 Sept. 1877, when he was called home. He was second counsellor to the presidency 1880-1901, and first counsellor April 1901 to 10 Oct. 1901. On the last-named date he was sustained as president of the Church.

President Smith's civic record comprises the offices of territorial legislator, city councillor, and university regent, in all of which he served repeatedly. As a member of the municipal government he was the main mover in securing from heirs of President Brigham Young Liberty Park and Pioneer Square as public parks for Salt Lake City. He was a member of the House of the Utah Legislature 1865, and in 1882 was a member of the legislative council, presiding over it at the latter session. He was also president of the constitutional convention held the same year. He assisted in the organization of Zion's Co-operative Mercantile Institution, Zion's Savings Bank and Trust Company, the State Bank of Utah, and the Utah Sugar Company, over all of which he was the president. He was also president of the Consolidated Wagon and Machine Company and was connected with many other concerns.

In the auxiliary organizations of the Church he was the head of the Young Men's Mutual Improvement Association and the Deseret Sunday School Union, and was senior editor of the *Improvement Era* and the *Juvenile Instructor*, the official organs of these two organizations of young people of the church.

Early in 1904 President Smith was summoned to Washington to testify before the Senate Committee of Privileges and Elections in the case of Reed Smoot (q.v.), senator-elect from Utah, upon whose eligibility the committee was called to pass. During a prolonged examination the witness displayed a mental resourcefulness equal to that of his distinguished interrogators.

SMITH, Joshua Toulmin (TOULMIN SMITH), English author: b. Birmingham, 29 May 1816; d. Lancing, Sussex, 28 April 1869.

JOSEPH F. SMITH

Late President of the Church of Latter-Day Saints

He entered Lincoln's Inn in 1835 to study for the bar, but soon turned his attention to literature, especially interesting himself in the Scandinavian languages and literature. He lived in the United States, at Detroit, Utica and Boston, in 1837-42, engaged in lecturing and writing. During this period he published his 'Discovery of America by the Northmen of the 10th Century' (1839), the first presentation in English of the Icelandic sagas, and a work which remains an authority. Returning to England he resumed his legal studies, made a special study of old Saxon law, and was called to the bar in 1849. He became known as a writer not only on legal topics, but on geology, in which field his 'Ventriculidæ of the Chalk' (1848) is still authoritative, and on sanitary science and mineralogy, as well as being an antiquarian of note. As a powerful and well-informed writer he exerted a wide influence. He edited *Parliamentary Remembrance* in 1857-65, a weekly report of the proceedings of Parliament amplified by historical commentaries and illustrations of unique value, but which failing health compelled him to discontinue. His 'English Gilds' (1870) was edited by his daughter and published posthumously.

SMITH, Judson, American Congregational clergyman and educator: b. Middlefield, Mass., 28 June 1837; d. Roxbury, Mass., 29 June 1906. He was graduated at Amherst College in 1859, at Oberlin Theological Seminary in 1863 and was ordained in the Congregational Church in 1866. He was professor of Latin at Oberlin in 1866-70; of ecclesiastical history and positive institutions at the Oberlin Theological Seminary in 1870-84; and was also lecturer on modern history at Oberlin in 1875-84, and lecturer on history at Lake Erie Female Seminary in 1879-84. He edited the *Bibliotheca Sacra* in 1882-84, and was thereafter associate editor. From 1884 he was foreign secretary of the American Board of Commissioners for Foreign Missions, and he made a visit of inspection to missions in Turkey in 1888 and to those in China in 1898. Author of 'Lectures in Church History' (1881); 'Lectures on Modern History' (1881).

SMITH, Julia Holmes, American physician: b. Savannah, Ga., 23 Dec. 1839. She began the study of medicine in 1873 at the medical school of the Boston University and graduated from the Chicago Homœopathic College in 1877. Since then she has practised in Chicago and contributed to medical literature. Upon appointment by Governor Altgeld she became the first woman trustee of the University of Illinois. She has been professor of gynecology and dean of the National Medical College; superintendent of the Department of the Northwest, New Orleans Cotton Exposition, 1885, and vice-president Homœopathic Congress, Columbian Exposition, 1892-93. She organized and was first president of the Woman's Medical Association. She retired from medical practice in 1914.

SMITH, Justin Harvey, American writer: b. Boscawen, N. H., 13 Jan. 1857. He was graduated from Dartmouth College in 1877, and became a member of the publishing firm of Ginn and Company. In 1899 he was called to the chair of modern history at Dartmouth, which

he resigned in 1908. Has traveled extensively in North America, Europe, the Near and Far East, northern Africa, etc. He is author of 'The Troubadours at Home' (2 vols., 1899); 'Arnold's March from Cambridge to Quebec' (1903); 'A Tale of Two Worlds and Five Centuries' (1903); 'Our Struggle for the 14th Colony' (2 vols., 1907); 'The Annexation of Texas' (1911), etc., and numerous magazine articles.

SMITH, Marcus Aurelius, American lawyer and senator: b. near Cynthiana, Ky., 24 Jan. 1852. He was graduated at Transylvania University, was admitted to the bar, and in 1881 removed to Arizona where he engaged in the practice of law. He served for 16 years as territorial delegate from Arizona before her admission as a State, and upon her admission he was elected one of her first senators in 1912. He was re-elected in 1914. His work in Congress has been connected with irrigation and reclamation problems.

SMITH, Melancton, American naval officer: b. New York, 24 May 1810; d. Green Bay, Wis., 19 July 1893. He entered the navy as midshipman, was commissioned lieutenant in 1837, served in the Florida war on the *Poinsett*, and during the Civil War joined Farragut's fleet with the *Massachusetts*, destroyed the Confederate ram *Manassas*, and took part in running the batteries at Vicksburg, 14 March 1862. He was promoted commodore in 1866 and rear-admiral in 1870, and was commandant at the Brooklyn navy yard 1870-72.

SMITH, Morgan Lewis, American soldier: b. Oswego, N. Y., 8 March 1822; d. Jersey City, N. J., 29 Dec. 1874. He removed to New Albany, Ind., in 1843, served for a time in the United States army, and later engaged in the steamboat business. Upon the outbreak of the Civil War he re-entered the army, raised the Eighth Missouri infantry, and was commissioned its colonel in July 1861. He was in command of a brigade at both Fort Donelson and Shiloh, and in July 1862 he was appointed brigadier-general of volunteers. He later served under Sherman, was severely wounded at Vicksburg in December 1862, but returned to duty in October 1863 and afterward participated in the Atlanta campaign. He was later military commander of Vicksburg, where his firm measures were successful in restoring quiet and order. He resigned from the army in July 1865, and later was United States consul at Honolulu.

SMITH, Munroe, American jurist and political scientist: b. Brooklyn, N. Y., 8 Dec. 1854. He was graduated from Amherst in 1874, and from the Columbia Law School in 1877; he then studied abroad, receiving the degree of J.U.D. (doctor of laws) from the University of Göttingen. On his return from Germany in 1880 he was appointed instructor in the department of history at Columbia University, in 1883 became adjunct professor of history, and in 1891 professor of Roman law and comparative jurisprudence. He was one of the founders of the 'Political Science Quarterly' in 1886, of which he was managing editor until 1913. He has edited 'Selections from Cicero' in 'The World's Best Books' (1900), and has written 'Bismarck and German Unity' (1898; 2d ed., 1911); 'Jurisprudence' (1908); 'Military

Strategy versus Diplomacy in Bismarck's Time and Afterward' (1915), and numerous legal and political articles.

SMITH, Nathan, American physician: b. Rehoboth, Mass., 13 Sept. 1762; d. New Haven, Conn., 26 July 1828. He served in the Vermont militia the last year and a half of the Revolutionary War, and later settled in Vermont. He took up the study of medicine at the age of 24, and after some years of practice at Cornish, N. H., he entered Harvard University, where he was awarded the degree of M.B. in 1790, the third graduate of the medical department. He established the medical department at Dartmouth College in 1798, and subsequently taught most of its departments. He studied at the University of Edinburgh in 1803, afterward returning to Dartmouth. From 1813 until his death he was professor of the theory and practice of surgery at Yale University. He also lectured at the University of Vermont in 1822-25, and at Bowdoin College in 1820-25. He greatly aided the betterment of facilities for securing medical education in the United States. His practice extended over four States. He is said to have performed the first operation in America for the extirpation of ovarian tumor, and that of staphyloorrhaphy; and his name is connected with an improved method of amputation of the thigh. Author of 'Practical Essays on Typhus' (1824).

SMITH, Nathan Ryno, American surgeon, son of Nathan Smith (q.v.): b. Concord, N. H., 21 May 1797; d. Baltimore, Md., 3 July 1877. He took his M.D. at Yale University in 1820 and in 1824 began the practice of surgery at Burlington, Vt. He was professor of surgery and anatomy at the University of Vermont in 1825-27; occupied the chair of surgery at the University of Maryland in 1827-28; was professor of the practice of medicine at the University of Transylvania in 1828-40; and in 1840-70 was again professor of surgery at the University of Maryland. He invented an instrument rendering the operation of lithotomy safe, and a splint for fractures of the thigh. He contributed numerous articles to the *American Journal of Medicine* and was author of 'Surgical Anatomy of the Arteries' (1832-35); 'Treatment of Fractures of the Lower Extremities by the Use of the Anterior Suspensory Apparatus' (1867), etc.

SMITH, Percy Franklyn, American mathematician: b. Nyack, N. Y., 21 Aug. 1867. He was graduated at Yale University in 1888, took his Ph.D. there in 1891 and later studied at the universities of Göttingen, Berlin and Paris. He was connected with the Sheffield Scientific School at Yale from 1888 and since 1900 he has been professor of mathematics there. He is editor of the *Transactions of the American Mathematical Society*, and was joint editor of 'Elements of Differential Calculus' (1904). Author of 'Elementary Calculus' (1902); 'Four-Place Logarithmic Tables' (1902); and joint author of 'Elements of Analytic Geometry' (1905); 'Theoretical Mechanics' (1910); 'The New Analytic Geometry' (1912), etc.

SMITH, Richard Penn, American dramatist: b. Philadelphia, 13 March 1799; d. Falls of Schuylkill, Pa., 12 Aug. 1854. He was the

author of numerous plays, 15 of which were produced on the Philadelphia stage. Among them are 'Caius Marius,' a tragedy acted by Edwin Forrest in 1831; 'The Disowned' and 'The Deformed,' both presented in London; 'The Water Watch'; 'The Venetians,' and 'The Actress of Padua.' A selection of his 'Miscellaneous Works,' collected by his son, Horace Wemyss Smith, and including a biographical sketch, was published in 1856; and 'Complete Works' with sketch and memoir was published by his son in 1888 (4 vols.). Consult Rees, 'Dramatic Authors of Philadelphia.'

SMITH, Richard Somers, American educator: b. Philadelphia, Pa., 30 Oct. 1813; d. Annapolis, Md., 23 Jan. 1877. He was graduated from West Point in 1834, served on topographical duty and resigned in 1836. He was reappointed to the army in 1840, and became instructor at West Point, which position he held until 1855, when he again resigned, serving successively as professor of mathematics in the Brooklyn Institute of Technology and as a director of Cooper Institute, New York. In 1861 he was appointed to the Federal army for a third time; he served, as major of infantry, until after the battle of Chancellorsville, when he resigned his commission and accepted the presidency of Girard College, Philadelphia. He relinquished this in 1867; in 1870 was appointed professor of mathematics at the United States Naval Academy, and in 1873 was transferred to the department of drawing. His publications comprise a 'Manual of Topographical Drawing' (1853), and 'Linear Perspective' (1857).

SMITH, Roswell, American publisher: b. Lebanon, Conn., 30 March 1829; d. New York, 19 April 1892. He purchased *Scribner's Monthly*, the name of which he changed to the *Century* in 1881. Securing Dr. J. G. Holland as editor he made a wonderful success, and for many years set the pace for other magazines both in America and abroad. He founded the Century Company, of which he was president until his death in 1892. Under his guidance the company also published *Saint Nicholas*, a young folks magazine, the 'Century Dictionary' and other works.

SMITH, Samuel, American soldier: b. Lancaster, Pa., 27 July 1752; d. Baltimore, Md., 22 April 1839. He was appointed captain in a Maryland regiment at the outbreak of the American Revolution and served until 1779, having been in command of Fort Mifflin when it was bombarded by the British fleet for 42 days in 1777. He resigned his commission in 1779, represented Maryland in Congress, 1793-1803 and 1816-22, and in the United States Senate, 1803-15 and 1822-33, serving much of the time as chairman of the Finance Committee. As major-general of the State militia he defended Baltimore from mob rule in 1835, and for three years afterward was mayor of that city.

SMITH, Samuel Francis, American Baptist clergyman and poet: b. Boston, Mass., 21 Oct. 1808; d. there, 16 Nov. 1895. He was graduated from Harvard in 1829, from Andover Theological Seminary in 1832 and was ordained in 1834. He was engaged in various pastorates in 1834-54, at the same time acting as professor of modern languages at Waterville College (Colby University) in 1834-42, and as

editor of the *Boston Christian Review* in 1842-48. He was editor of the publications of the Baptist Missionary Union in 1854-69, and in 1875-76, 1880-82, he visited the chief missionary stations in Europe and Asia. He was famous as the author of 'My Country 'Tis of Thee' (1832), which became a national hymn, and he also wrote the hymn 'The Morning Light is Breaking' at about the same time. His publications include 'Lyric Gems' (1843); 'The Psalmist' (1843); 'Life of Rev. Joseph Grafton' (1848); 'History of Newton, Mass.' (1880); 'Rambles in Mission Fields' (1884), etc.

SMITH, Samuel Stanhope, American Presbyterian clergyman and college president: b. Pequa, Pa., 16 March 1750; d. Princeton, N. J., 21 Aug. 1819. He was graduated at Princeton University in 1769 and in 1774 was ordained in the Presbyterian ministry. He was the first president of Hampden Sidney College, in 1775-79. He became professor of moral philosophy at Princeton in 1779, and also held the chair of theology from 1783; he was vice-president from 1786, and was president of the university in 1795-1812. He rendered the university invaluable service in its reorganization after the ravages of the Revolution. He was one of the committee which drafted the laws of government for the Presbyterian Church. Author of 'Lectures on Moral and Political Philosophy' (2 vols., 1812); 'Comprehensive View of Natural and Revealed Religion' (1815).

SMITH, Seba, American journalist: b. Buckfield, Me., 14 Sept. 1792; d. Patchogue, L. I., 29 July 1868. He was graduated from Bowdoin College in 1818 and entered the journalistic world as a writer for the Portland papers. Under the pen name of Maj. Jack Downing, he began a correspondence in the dialect of New England bearing upon the political issues of the day, which was continued for some time, and, having been collected and published in book form in 1833, gained considerable popularity. From 1822 to 1842 he was the editor successively of three of the Portland papers, when, having acquired a somewhat wider reputation as a political satirist, he removed to New York, where he wrote for numerous periodicals. His later published works are 'Powhatan' (1841), a tale of verse; 'New Elements of Geometry,' a parody (1850), and 'Way Down East' (1853).

SMITH, Sidney, English clergyman, author and wit: b. Woodford, Essex, 3 June 1771; d. London, 22 Feb. 1845. He was educated at New College, Oxford, of which he became a Fellow in 1791, and obtained in 1794 the curacy of Netheravon, a village in Salisbury Plain, near Amesbury. In 1796-1801 he was in charge of an Episcopal congregation at Edinburgh and tutor to Michael Hicks Beach. Here he continued for five years, and made the acquaintance of the most distinguished intellectual men of the day, including more especially that circle of youthful geniuses, composed of such men as Jeffrey, Horner, Walter Scott, Lord Brougham, Leyden and others. Many of them espoused with ardor liberal views in politics and literature, and with the view of disseminating these Smith proposed to his comrades the starting of a *Review*, a project entered upon with enthusiasm. Thus commenced in 1802 the

famous *Edinburgh Review*, of which Jeffrey acted as editor for many years and Smith as one of its raciest and most influential contributors. In 1803 Smith removed to London, where he delivered a course of lectures on moral philosophy at the Royal Institution (1804-06), which were extremely popular, and were subsequently published. In 1806, during the reign of the Whig party, he was presented to the living of Fosbrooke, near York, in 1828 was given a prebend at Bristol and in 1831 was made canon residentiary of Saint Paul's, London. This was the utmost dignity to which he attained in the Church, it being generally believed that but for his Whig views he would have reached a bishopric. Not long afterward he came prominently forward in a series of pungent epistolary attacks on Lord John Russell, occasioned by his introduction of a bill into Parliament which materially encroached on the rights of deans and chapters. About his last literary effort was the exposure of the fraud perpetrated by the State of Pennsylvania in the repudiation of its public debts. Smith was himself a sufferer by this breach of national faith, and his sarcastic remarks on the subject excited both a little amusement in England and not a little indignation in the United States. Another characteristic publication was 'Letters on the Subject of Catholics' (1807-08), which was of influence in securing Catholic emancipation. A few years before his death a collected edition of his writings was published under his own superintendence. It has been said, "Smith's reputation as an English wit is solid—if that word can be applied to so volatile a quality." He was one of the greatest of jesters and makers of *bon-mots*, but remarkable also as a thinker and English stylist. Consult Reid, 'Life and Times of Sidney Smith' (1884); also the 'Memoir' by Lady Holland; and Duyckwick, 'Wit and Wisdom of Sidney Smith' (1856).

SMITH, Sidney Irving, American biologist: b. Norway, Me., 18 Feb. 1843. He was graduated at the Sheffield Scientific School, Yale University, in 1867 and became assistant in zoology there. In 1871 he was in charge of the deep water dredging in Lake Superior for the United States Lake Survey, and in 1872 he was engaged in similar work for the United States Coast Survey at Saint George's banks. In 1875-1906 he was professor of comparative anatomy at Yale University, and was afterward professor emeritus. He was associated with the United States Fish Commission in 1871-87 and was elected to the National Academy of Sciences in 1884. He was an authority on American marine invertebrate zoology, and was author of numerous papers on his specialty.

SMITH, Sophia, American philanthropist: b. Hatfield, Mass., 27 Aug. 1796; d. there, 12 June 1870. Her early life was spent in comparative obscurity, but was enlivened by a rather wide range of reading and the acquisition of such desultory knowledge as she could obtain thereby. Having been early impressed with the need of women for opportunities for higher education, it was her privilege to establish the first woman's college in New England by means of a fortune left her by a brother, Austin Smith, in 1861. Smith College (q.v.) was established in Northampton, Mass., in 1875, according to plans outlined by her and by means of funds

bequeathed by her in 1870 for the founding of such an institution.

SMITH, Theobald, American pathologist: b. Albany, N. Y., 31 July 1859. He was graduated at Cornell University in 1881 and took his M.D. at the Albany Medical College in 1883. He was director of the pathological laboratory of the Bureau of Animal Industry, United States Department of Agriculture, in 1884-95, and was also professor of bacteriology at Columbian (now George Washington) University in 1886-95. He was appointed director of the pathological laboratory of the Massachusetts Board of Health in 1895, and in 1896 became also professor of comparative pathology at Harvard University. From 1911 he was a member of the consulting board of scientific experts, United States Department of Agriculture. He became an authority on infectious diseases and made many important contributions to scientific knowledge. In 1886 he demonstrated the practicability of immunizing man to cholera by injection of the filtered virus of hogs; he discovered the organism of Texas fever in *Pyrosoma bigeminum* in 1889, and with F. L. Kilborne proved that it was communicated by the tick, *Boophilus bovis*; and in 1898 he distinguished the difference between the human and bovine tubercle bacilli, his findings being confirmed by Koch in 1900. He was elected to the National Academy of Sciences in 1908. He is author of many scientific papers and reports.

SMITH, Theodore Clarke, American historian and educator: b. Roxbury, Mass., 18 May 1870. He was graduated at Harvard University in 1892, took his Ph.D. there in 1896 and later studied at the universities of Paris and Berlin. He was assistant professor of political science at the Ohio University in 1901-03; and has since been professor of American history at Williams College. Author of 'Liberty and Free Soil Parties of the Northwest' (1898); 'Political Reconstruction' (1903); 'Parties and Slavery' (1908); 'Wars Between England and United States' (1914).

SMITH, Thomas, English scholar and diplomatist: b. Saffron Walden, Essex, 23 Dec. 1513; d. 1577. He studied at Queen's College, Cambridge, became a Fellow there, 1531, and a public lecturer, 1538; he then studied at Padua and on his return became professor of civil law at Cambridge, 1544. During these years he succeeded in changing the English pronunciation of Greek. Under Edward VI he was knighted, and served as Ambassador to Belgium and France. He lived in retirement during Queen Mary's reign, but under Queen Elizabeth was Ambassador to France, 1562-66; a member of the Privy Council, 1571; and Secretary of State, 1572. He wrote, besides two monographs on the Greek and the English languages, an important work on the Tudor constitution, called 'De Republica Anglorum' (published 1583).

SMITH, Thomas Roger, English consulting architect. He has been professor of architecture in University College, London, from 1879. Among his professional books may be cited 'Elphinstone College and the Post Office, Bombay, India.' He has published 'Handbook of Architectural History,' 'Manual of Acoustics.'

SMITH, Thomas Southwood, English reformer: b. Martock, Somerset, 21 Dec. 1788; d. Florence, Italy, 10 Dec. 1861. He was educated for the Church, but early in his ministerial career among the poor of western England was impressed with the desire for a knowledge of medicine, and the necessity for improving the sanitary conditions of the homes of the people to whom his efforts were directed. He was graduated as a physician in 1812, and in 1820 began to practise in London. In 1825 he was appointed to the London Fever Hospital, and in 1830 published his 'Treatise on Fever' which is still regarded as a most able presentation of the subject. His interest in the industrial conditions of the laboring classes of London led to an inquiry into the subject of child labor which resulted in the passage of a Factory Act and the exclusion of children from work in the mines of Great Britain. He spent much time in investigating epidemics of cholera, yellow fever, and other contagious diseases, and rendered thereby a great service to medical science.

SMITH, Uriah, American Seventh Day Adventist leader: b. West Wilton, N. H., 2 May 1832; d. Battle Creek, Mich., 6 March 1903. He studied at Harvard, became a Seventh Day Adventist and rose to great prominence in that denomination. He became editor of the *Adventist Review* at Rochester, N. Y., in 1853 and removed to Battle Creek in 1855, when the office of this denominational organ was transferred to that city. He was at the head of the great denominational publishing house at Battle Creek, a professor of Bible study in the Adventist College, and wrote many religious works, which reached a sale of 200,000 copies. Among them are 'The United States in the Light of Prophecy'; 'Daniel and the Revelation,' which attained a sale of 72,000 copies; 'The Sure Foundation.'

SMITH, William, Canadian jurist: b. New York, 25 June 1728; d. Quebec, Canada, 3 Nov. 1793. He was graduated at Yale University in 1745 and was admitted to the bar of New York. He was appointed chief justice of the province of New York in 1763, and became also a member of council in 1767, which post he nominally held until 1782. Upon the outbreak of the Revolution he was held on parole at his estate on the Hudson, but in 1778 he openly espoused the British cause, and in 1783 he went to England with the British troops. He was appointed chief justice of Canada in 1786 and held that office the remainder of his life. He established in Canada the office of constable to replace the use of soldiers in that capacity. Author 'History of the Province of New York from its Discovery in 1732' (1793).

SMITH, William, Canadian historian, son of Chief Justice William Smith (q.v.): b. New York, 7 Feb. 1769; d. Quebec, Canada, 17 Dec. 1847. He accompanied his father to England in 1783, was educated at a grammar school near Kensington and in 1786 went to Canada with his father. He was soon afterward appointed clerk of the Provincial Parliament, served also as master in chancery, and in 1814 he was appointed a member of the executive council. Author of 'History of Canada from its Discovery' (2 vols., 1815).

SMITH, William, English geologist: b. Churchill, Oxfordshire, 23 March 1769; d. Northampton, 28 Aug. 1839. After receiving an irregular education, during the course of which he displayed considerable talent for mathematics, he in 1787 became an assistant to a land-surveyor. He afterward began to act as a mining surveyor, and was led from some of his surveys of collieries to the idea of framing a model of the strata of a coal country, composed of the materials of the strata reduced to a scale, and placed in their relative positions to each other. He next began seriously to contemplate the composition of regular and extensive works on the subject of geology, and in 1815 he was able to submit a complete colored map of the strata of England and Wales to the Society of Arts.

SMITH, William Alden, American lawyer and senator: b. Dowagiac, Mich., 12 May 1859. He was a page in the Michigan house of representatives, later studied law, and in 1883 was admitted to the bar, afterward engaging in practice at Grand Rapids. He was active politically; was chairman of the State Republican Committee in 1888-92; served in Congress in 1894-1907; was elected to the United States Senate in 1906 and was re-elected in 1912. He was chairman of the Congressional Committee to investigate the *Titanic* disaster in 1912.

SMITH, William Benjamin, mathematician and New Testament critic: b. Stanford, Ky., 26 Oct. 1850. In 1871 he was graduated from the Kentucky University and in 1879 from the University of Göttingen. He taught and studied languages and sciences, 1871-76; was professor of mathematics in Central College, Missouri, 1881-85; then went to the University of Missouri, first as professor of physics, 1885-88, then as professor of mathematics, 1888-93. From 1893 to 1906 he held the chair of mathematics in Tulane University (Louisiana) and the chair of philosophy in the same institution after 1906. He published the following: 'Co-ordinate Geometry' (1885); 'Introductory Modern Geometry' (1893); 'Infinitesimal Analysis' (1898); 'Clew to Trigonometry' (1899); 'The Color Line' (1905) 'Des vorchristliche Jesus' (1906); pamphlets on the tariff and newspaper articles on the gold standard (1892-96); 'The Pauline Codices F and G' and other criticisms on the New Testament (1901-05); 'The Mermaid and the Seraph' (1906); and articles on the Bible, Calculus and New Testament problems in the *ENCYCLOPEDIA AMERICANA*.

SMITH, William Farrar, American soldier: b. Saint Albans, Vt., 17 Feb. 1824; d. Philadelphia, Pa., 28 Feb. 1903. He was graduated from the United States Military Academy in 1845, and was commissioned 2d lieutenant in the Topographical Engineers, and from 1846-48 was assistant professor of mathematics at the academy. At the beginning of the Civil War he served under General Butler, but later received command of a division of the Army of the Potomac, which participated in the siege of Yorktown and in the battles of Williamsburg, Malvern Hill and Antietam. He also took part in the battles of Fredericksburg (1862) and Gettysburg (1863). In 1863 he was appointed chief engineer of the Army of the Cumberland and planned the battles of Brown's Ferry and Missionary Ridge. At the close of the war he

resigned from the army and became president of the International Ocean Telegraph Company and of New York board of police.

SMITH, William Henry, American journalist: b. Austerlitz, N. Y., 1 Dec. 1833; d. Lake Forest, Ill., 27 July 1896. He turned to newspaper work in 1854, being attached to the *Cincinnati Times*, first as reporter and later as managing editor. At the beginning of the Civil War he was an editorial writer on the *Gazette*, where his pen was active in the support of the government. In 1864-66 he was secretary of state of Ohio, but resigned before the completion of his second term and established the *Evening Chronicle* at Cincinnati. In 1870 he became general manager of the Western Associated Press, and in 1883, at the consolidation of the New York and Western associations, retained the general managership of the body. Meantime, in 1877, he had been appointed collector of the port of Chicago, and he was instrumental in introducing customs methods to harmonize with the civil service policy of the government. He published 'The Saint Clair Papers' (1882), a biography of Charles Hammond and a 'Political History of the United States.' During researches in the British Museum he found unpublished letters of Washington to Col. Henry Bouquet and detected errors in those published by Jared Sparks. At the time of his death he was engaged on the 'Life and Administration of President Rutherford B. Hayes,' and since his death has appeared his 'Political History of Slavery' (1903).

SMITH, William Robertson, Oriental scholar: b. 1846; d. 31 March 1894. He was the son of the Free Church minister at Keig, Aberdeenshire; was educated at Aberdeen University, where he graduated in 1865, taking the highest honors. Subsequently he spent some time at the New College, Edinburgh, and continued his German studies at Bonn and Göttingen, where his ideas upon scientific research were acquired. Thereafter, from 1868 to 1870 he acted as assistant to Professor Tait, professor of physics in Edinburgh University. In 1870 he was appointed to the chair of Hebrew and New Testament exegesis in the Free Church College at Aberdeen. His free criticism of the Old Testament writings resulted in a charge of heresy, and after prolonged discussion in the Free Church courts, during which his honesty was no less conspicuous than his learning, he was removed from his professorship in 1881. From this period he became associated with Professor Baynes in the editorship of the 'Encyclopedia Britannica,' and when the latter died he succeeded to the position of editor-in-chief. More than any other writer or researcher he emphasized the character of human editing and arbitrary rendering that has gone into the Scriptures and become classed as inspired. Meanwhile he had visited Arabia in 1879-80, where he gained an intimate knowledge of the people and their language, which qualified him to fill the position of professor of Arabic in Cambridge University, to which he was appointed in 1883. Subsequently he became a Fellow of Christ's College, and in 1886 he was elected university librarian, a post which he exchanged in 1889 for the Adams professorship of Arabic. Probably his most popular works are 'The Old Testament in the

Jewish Church' (1881) and the 'Prophets of Israel' (1882). But he is best known to scholars as the author of 'Kinship and Marriage in Early Arabia' (1885) and his first series of Burnett lectures, 'Religion of the Semites: Fundamental Institutions' (1889).

SMITH, William Sooy, American army officer and engineer: b. Tarlton, Ohio, 22 July 1830; d. 4 March 1916. He was graduated from the United States Military Academy in 1853 and assigned to frontier duty. The following year he resigned his commission for more active life, and became assistant engineer of the Illinois Central Railroad. He practised the profession of an engineer in various cities of the United States until the beginning of the Civil War, when he entered the volunteer service. He was promoted brigadier-general 15 April 1862, and commanded successfully the second division of the Army of the Ohio, the first division of the 16th army corps and the cavalry division of the Department of the Tennessee, but was obliged to retire from active service on account of prolonged illness in 1864. His fame as an engineer rests upon his many improvements of the method of sinking foundations for the security of high buildings and in the use of pneumatic caissons in bridge building. His name is identified with the building of the first steel bridge, a structure which spans the Missouri at Glasgow, the construction of the Wangoshanee Lighthouse in the Straits of Mackinac, the Hudson River Tunnel and other bridge and railway work throughout the United States and Canada.

SMITH, William Waugh, American educator: b. Warrenton, Va., 12 March 1845; d. 17 Jan. 1912. He served in the Confederate army through the Civil War, and was graduated at Randolph-Macon College in 1871. He became professor of languages there in 1878, president in 1886 and chancellor in 1897. He organized the Randolph-Macon System of Colleges and Academies of Virginia, raising large sums of money for the purpose, and also founded the Randolph-Macon Women's College at Lynchburg, Va. Author of 'Outlines of Psychology' (1880); 'A Comparative Chart of Syntax, Latin, Greek, German, French and English' (1882), etc.

SMITH COLLEGE, located at Northampton, Mass. It was founded by Sophia Smith, who bequeathed \$393,105 for "an institution of learning for the higher education of young women, with the design to furnish them means and facilities for education equal to those which are afforded in the colleges for young men." The college was incorporated in 1871 and opened to students in 1875; it is unsectarian in its management and instruction. The college confers the three degrees of A.B., M.A., and Ph.D. The course includes a year's work in eight required subjects, including Bible study, a major study consisting of related courses in the junior and senior years, two three-hour courses in the junior and senior years, one of which must be in a department entirely different from the major study, and free electives to complete the required number of hours. The curriculum includes music and art, and a certain amount of technical work in each department when combined with theoretical courses counts toward the degree. Formerly the departments of music and art were organized as separate

schools, but in 1902 were co-ordinated with the other collegiate studies. The college was among the first to recognize music and art among the qualifications for the degree. A number of scholarships are provided, the largest of which has a fund of \$10,000; there are also fellowships for advanced work in philosophy and psychology, botany and zoology; and the college aids in the support of the American women's table at the zoological station at Naples, entitling graduates to appointment to this station. Likewise two tables are maintained at the seaside laboratories for the advanced study of zoology and botany. Physical training is required of students, and much interest is also taken in outdoor sports. The college has a large and beautiful campus, including the botanical gardens; the buildings (in 1904) are College Hall, Seelye Hall, the John M. Greene Hall, Lilly Hall of Science, Chemistry Hall, the Library, the Observatory, Music Hall, the Hellyer Art Gallery, the Alumnæ Gymnasium, the Infirmary, the Lyman Plant House, the Botanic Garden, the Students' Building, the centre of the students' social life, with a large hall, rooms for clubs, etc., and a reading-room, and 18 dwelling-houses. The library contains about 70,000 volumes, and the Northampton Public Library and the Forbes Library are also open to students. The productive funds in 1917 amounted to \$2,242,591, the students numbered 1,946 and the faculty 205. In the European War, Smith College sent a body of students to do reconstruction and canteen work in France; and maintained courses of instruction for laboratory assistants, and a two years' course for training assistants, in neurological hospitals for the treatment of nervous debility and shell shock among returned soldiers.

SMITH-LEVER AGRICULTURAL EXTENSION ACT, an act passed by the United States Congress in 1914 to provide extra-mural instruction and to diffuse among the American farmers agricultural information. See AGRICULTURAL LEGISLATION.

SMITH SOUND, a passage of water at the northern extremity of Baffin Bay, between Peary Land, in Greenland, and Ellesmere Land. It leads from Baffin Bay into Kane Basin, a body of water about 110 miles long. Its southern entrance was discovered by Baffin in 1616. In 1854 it was surveyed by a United States expedition under Dr. Elisha Kent Kane.

SMITHFIELD, a historic square in London, a little north of Newgate and west of Aldersgate, which was until 1855 the only cattle market in London. It was outside the old city walls and in the 11th century was an open spot where the citizens delighted to promenade. Before the days of Tyburn, Smithfield (now called West Smithfield to distinguish it from East Smithfield, Tower Hill) was the place of public execution. Here Sir William Wallace and Mortimer, Earl of March, suffered death; here Walworth, the mayor, stabbed Wat Tyler; and here Jack Straw was hanged. Tournaments were held on this spot; Edward III celebrated the deeds of Cressy and Poitiers by mimic feats of arms here; and here Richard II gave a three days' tournament to celebrate his marriage. A more terrible page of history tells of the murders by way of burning which took place here in the name of religion. Bartholo-

mew Fair, so often mentioned in literature, was held at Smithfield. We find mention of a cattle market having been held here as far back as 1150. The corporation had official control over the market for above 500 years, dating from 1345.

SMITHFIELD (W. Va.), **Engagement at.** This place, near the east bank of the Opequon, on the road from Charlestown to Bunker Hill, W. Va., was the scene of many skirmishes and minor engagements during the Civil War, one of which, at least, deserves to be noted. On 28 Aug. 1864, after General Early had recrossed the Opequon from his engagement at Shepherdstown (q.v.), General Sheridan advanced his army from Halltown toward Charlestown and the Opequon. General Merritt's cavalry division marched by way of Lee Town, attacked Fitzhugh Lee's cavalry at that place and drove it through the village, back through Smithfield and across the Opequon. Next morning Merritt crossed the Opequon and was on his way to attack Early at Bunker Hill, when he was met by Early, with the divisions of Ramseur and Gordon and driven back across the Opequon. There was an artillery duel across the stream and, the Confederate cavalry crossing, Merritt was driven from Smithfield and two miles beyond, in the direction of Charlestown. Early re-established his cavalry east of the Opequon and marched his infantry back to Bunker Hill. Late in the day Ricketts' division of infantry came to Merritt's assistance and drove the Confederate cavalry from Smithfield and across the Opequon and Merritt resumed his position at the Smithfield bridge. The Union loss was about 35 killed and wounded; the Confederate loss, 10 killed and 75 wounded.

SMITHSON, James, founder of the Smithsonian Institution at Washington: b. Weston, Super-Mare, Somerset, England, about 1765; d. Genoa, Italy, 27 June 1829. His mother at the time of his birth was the widow of James Macie, a country gentleman of an old family. Smithson describes himself in his final will as "son to Hugh, first Duke of Northumberland, and Elizabeth, heiress of the Hungerfords of Studley, niece to Charles the Proud, Duke of Somerset." Smithson seems himself to have observed no reticence about what he thought the true facts of his birth, but the name of Macie appears to have been imposed upon him from his youth by his parents and his feeling that he must create for himself a position which his birth had denied him is perhaps a reason for his subsequent bequest to the United States of the means which founded the institution bearing his name which he had later assumed and which was the family name of Sir Hugh Smithson, the first Duke of Northumberland. It cannot but be supposed that something of this kind was in his mind when he wrote "My name shall live in the memory of man when the titles of the Northumberlands and the Percys are extinct and forgotten."

Nothing material is remembered of his life at Oxford, where he entered under the name of Macie as a gentleman commoner in 1782, though he appears to have been partly occupied in chemistry, which was the scientific interest of his later life, and this at a time when the study of physical science was almost unknown in the university. He was graduated at Pembroke

College with the degree of master of arts in 1786 and was admitted as a Fellow of the Royal Society in the following year on the recommendation of Cavendish and other eminent fellows of the Society. Smithson published in all 27 scientific papers, eight in the *Philosophical Transactions* between 1791 and 1807, one in the *Philosophical Magazine* and 18 in 'Thompson's Annals of Philosophy' between 1819 and 1825.

Prof. F. W. Clarke gives the following view of the value of Smithson's scientific work:

"To theory Smithson contributed little, if anything; but from a theoretical point of view the tone of his writings is singularly modern. His work was mostly done before Dalton had announced the atomic theory and yet Smithson saw clearly that a law of definite proportions must exist, although he did not attempt to account for it. His ability as a reasoner is best shown in his paper upon the Kirkdale bone cave which Penn had sought to interpret by reference to the Noachian deluge. A clearer and more complete demolition of Penn's views could hardly be written to-day. Smithson was gentle with his adversary, but none the less thorough for all his moderation. He is not to be classed among the leaders of scientific thought; but his ability and the usefulness of his contributions to knowledge, cannot be doubted."

An important ore of zinc was named Smithsonite after him.

That he held a high place among his contemporaries is evident from the fact that the president of the Royal Society in a necrology for the year 1829 associated the name of Smithson with those of Wollaston, Young and Davy, saying that "he was distinguished by the intimate friendship of Mr. Cavendish and rivaled our most expert chemists in elegant analyses." He was, then, most noted in this connection, and exhibited an industry the more creditable to him, since he was at this time a man of large means. Of Smithson's later life little is known, but his declining years appear to have been tried by painful infirmities. He lived in these years principally in Paris and Genoa and one gathers from his letters and from the uniform consideration with which he speaks of others and from kind traits which he showed, the impression of an innately gentle nature, but also of a man who was renouncing, not without bitterness, the youthful hope of fame.

Smithson's will, dated from London 23 Oct. 1826, is a brief document leaving his property to a nephew and in the case of the death of the nephew without leaving a child, he adds: "I then bequeath the whole of my property to the United States of America to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men."

The will was proved in the Prerogative Court of Canterbury, the value of the effects being sworn to be not over £120,000, a sum much larger in relative importance at the time than it would be now. The money appears to have come from his mother's family; there is, at least, no indication that any portion whatever of the Smithson bequest was derived from his Northumberland ancestry. It is not definitely ascertained why Smithson made the United States his legatee, in which he is not known to have had any correspondent or friend.

Smithson was buried in the little English cemetery on the heights of San Benigno, the remains and monuments in which are now being removed by the Italian government to another location. The regents of the Smithsonian Institution, who had caused a tablet to be erected to him in the cemetery and in the church, on the removal of the cemetery, appointed one of their number, Dr. Alexander Graham Bell, to bring the remains from Genoa to Washington, where they arrived in the early part of 1904 and were later interred on the grounds of the Smithsonian Institution. Consult Rhee, 'James Smithson and His Bequest' (in Vol. XXI, Smithsonian Miscellaneous Collections); Langley, 'James Smithson' in 'The Smithsonian Institution, 1846-1896. The History of Its First Half Century' (1897).

S. P. LANGLEY,

Late Secretary, Smithsonian Institution.

SMITHSONIAN INSTITUTION, The, an establishment at Washington, founded under a bequest of James Smithson (q.v.), couched in the following terms: "I bequeath the whole of my property to the United States of America to found at Washington under the name of the Smithsonian Institution an establishment for the increase and diffusion of knowledge among men."

In 1835, six years after Smithson's death at Genoa, Italy, the United States legation at London was notified that his estate, amounting in value to about £100,000, was held in possession of the accountant general of the British Courts of Chancery. President Jackson, in a message to Congress, dated 17 Dec. 1835, notified that body and after considerable debate a bill was passed and approved on the 1st of July 1836, authorizing the President to assert and prosecute the claim of the United States to the legacy, which it is well to note was relatively of greater purchasing power then than now, being greater than the endowment of any university or college in the country except Harvard at that time. The President selected as agent Richard Rush of Pennsylvania, who proceeded to London and entered a friendly suit in the Courts of Chancery, which was settled in two years. For eight years the matter was discussed in Congress, until on 10 Aug. 1846 an act which had passed both Houses was approved by the President, in terms so broad as to allow for any future development of the institution along any lines of intellectual advancement.

System of Administration.—The establishment consists of the President of the United States, who is the presiding officer *ex officio*; the Vice-President, the chief justice of the United States and the members of the Cabinet. In addition to the establishment, there is provided a board of regents, by whom the business of the institution is administered, composed of the Vice-President of the United States, the chief justice of the United States, three members of the Senate, three members of the House of Representatives and six citizens, two of whom must be residents of the District of Columbia, and the other four from States of the Union, but no two from the same State. The senatorial regents are designated by the president of the Senate and those representing the House by the speaker of the House, the others being elected by Congress with the ap-

proval of the President. There is a secretary to the establishment, who is also secretary to the board of regents. Both the Congressional and citizen regents have been selected from among the most distinguished Americans and the roll of them for 50 years contains the names of many eminent public men and scholars. The regents elect three of their number as an executive committee. The presiding officer of the regents is the chancellor and is elected by the board, though the position is customarily held by the chief justice. The secretary of the institution, whose office is created by the fundamental act, is elected by the regents and is the executive officer of the institution. He is aided in his work by the assistant secretary, by the heads of the various bureaus of the institution and by a large corps of scientific men.

The institution occupies a building in the Mall, in the square known as the Smithsonian Park. It was planned by James Renwick, was begun in 1847 and completed in 1855.

The first secretary was Joseph Henry, distinguished in science for his epoch-making discoveries. It fell to his lot more than it could to any of his successors to determine what form the institution should take and his "Programme of Organization," adopted at the outset by the board of regents as the governing policy, has been found broad enough for all future time. Upon his death he was succeeded in 1878 by Spencer Fullerton Baird, the leading authority on the natural history of America, and the founder of the United States Fish Commission, and upon his death in 1887 Samuel Pierpont Langley was elected, to be succeeded by Charles D. Walcott. The terms of each of these men have been marked by some special feature—Henry developed the system of international exchanges and that of meteorological observations, which has since become the Weather Bureau; Baird devoted himself to the development of the Museum, secured the erection of a Museum Building, gave much attention to explorations and, as United States Commissioner of Fish and Fisheries, secured the construction of the exploring ship *Albatross*, which has been of such great advantage to American science. In the term of Langley, the National Zoological Park and the Astrophysical Observatory were established, and a new building authorized for the National Museum. Langley's special contribution was in the demonstration of mechanical flight by a machine heavier than the air, propelled by its own power. "Langley Field," devoted to experiments in aviation, was established near Hampton, Va., as a direct result of his researches. The recent activities of the institution covered geological explorations in the Canadian Rockies by the present secretary, paleontological research in the Appalachian and Ohio valleys by Dr. R. Bossler and Mr. C. Resser, and in Florida by Dr. Sellards and Dr. Hrdlička. Extensive biological and botanical work was carried on in Cuba, Haiti, the Hawaiian Islands, China, Santo Domingo and Celebes. A botanical station was also established at Jamaica, devoted to the study of West Indian specimens. In 1917 an expedition under Collins and Garner left to explore the French Kongo and adjacent territories.

National Research Council.—This body was organized in 1917 and consists of scientists devoted to research. After the declaration of

THE SMITHSONIAN INSTITUTION AT WASHINGTON, D. C.

JAMES SMITHSON

Founder of the Smithsonian Institution

war by the United States, this council was called upon to co-operate with the Council of National Defense, and several of its committees were given special accommodations under the latter council: notably the committees of chemistry, engineering, medicine, hygiene, physics, agriculture and psychology. A foreign service committee was also organized as a "direct aid in acquainting investigators in this country with the scientific problems which have been confronted both in military and industrial pursuits in England and France."

Objects of the Institution.—The broad purposes of the institution are named in the words of the founder—"for the increase and diffusion of knowledge among men." This was interpreted by Henry in the following words: "To assist men of science in making original researches, to publish them in a series of volumes, and to give a copy of them to every first-class library on the face of the earth." It has supplied apparatus, made grants for experiments and furnished information to many thousands of persons. The institution also maintains a table at the biological station at Naples. It initiated, from the income of its own fund, all of the activities imposed upon it by the fundamental act, though as these gradually grew beyond this income, they were greatly aided by appropriations from Congress, through which the various bureaus are at present maintained.

Publications.—There is no restriction as to the subject of publications, and they consist of memoirs upon archæology, astronomy, ethnology, botany, zoology, geology, palæontology, meteorology, magnetism, physics, physiology and philology and many other branches of investigation. They cover the following series: (1) 'Annual Report of the Regents to Congress.' Since 1884 the 'Report of the Museum' has been printed in a separate volume, Part II. (2) 'The Smithsonian Contributions to Knowledge'; (3) 'The Smithsonian Miscellaneous Collection,' 28,000 pages. A 'Quarterly Issue' of this series was begun in 1903. The foregoing publications are maintained at the expense of the original fund; (4) 'The Bulletins of the National Museum,' 52 in number, beginning in 1875; (5) 'The Proceedings of the National Museum,' beginning in 1878. (6) 'The Annual Report of the Bureau of American Ethnology,' beginning in 1879; (7) 'The Bulletin of the Bureau of American Ethnology'; (8) 'The Annals of the Astrophysical Observatory'; (9) 'Reports of Historical and Patriotic Societies.' In 1897 a royal octavo volume containing the history of the first half century of the institution was published.

Library.—The publications noted above have been, since the beginning, distributed throughout the world, mostly to scientific and literary establishments and libraries; and in return the institution has received the publications of like organizations, forming a collection of books which in the departments of publications of learned societies and periodicals is one of the richest in the world. In 1865 the library was deposited with the Library of Congress and is now installed in a special hall upon the second floor of the new Library building. A working library of some 30,000 volumes has gradually grown up in connection with the institution and its dependencies. Much attention was given to

cataloguing and bibliography by the first assistant secretary of the institution, Charles C. Jewett. Henry likewise was greatly interested in this subject, and it was due to his initiative that the Royal Society of London took up its catalogue of scientific memoirs, which has since developed into the International Catalogue of Scientific Literature. For this latter work the Smithsonian Institution is the representative of the United States. In addition to the main Smithsonian Library, smaller collections are maintained in the various branches of the institution and 35 sectional technical libraries in the various offices for the use of the scientific staff.

The collection of objects of art was one of the original purposes of the institution, though it has been to some extent held in abeyance. The valuable collection of prints and art books of George P. Marsh was, however, purchased, and a room devoted to prints and art books is set aside in the Smithsonian building.

National Museum.—The Smithsonian Institution is the only lawful custodian of "all objects of art and of foreign and curious research, and all objects of natural history, plants and geological and mineralogical specimens belonging, or hereafter to belong, to the United States, which may be in the city of Washington." Out of this provision in the fundamental act there grew the National Museum. See UNITED STATES NATIONAL MUSEUM.

International Exchanges.—The system of international exchanges, begun in 1850, was designed for a free interchange of publications between men of science in various parts of the world. It established a body of correspondents which now numbers nearly 44,000, mostly abroad. In 1867 Congress assigned to the institution the duty of exchanging for the benefit of the Library of Congress 50 sets (a number since increased to 100) of all government publications, and in 1889 a treaty was entered into between the United States and other countries, in which this entire matter of exchange of scientific and government publications was fixed. This branch of the service, while not having a large space in the public eye, has been of great convenience to scientific men, of use in developing the libraries of this country, and indirectly has stimulated scientific research and publication, since by relieving scientific societies and individuals of the expense of exchanging their own publications, it has set large sums of money free for research. During the war in Europe it became necessary to suspend shipments to about 10 countries.

Bureau of American Ethnology.—This bureau is an outgrowth of researches beginning early in the history of the institution, whose first publication in the series 'Contributions to Knowledge' was on 'Ancient Monuments in the Mississippi Valley,' by Squier and Davis. In its present form the work of the bureau was commenced in 1872 by Maj. J. W. Powell, at the request of the Commissioner of Indian Affairs, who desired trustworthy information concerning the affinities of the Indian tribes. In 1879 the bureau was definitely organized under the direction of the Smithsonian Institution, and Major Powell was made director, serving in that capacity until his death in 1902. The bureau has engaged in researches in the languages, habits, customs, tribal organizations,

government, myths and ceremonies of the American Indians, and it is proposed to summarize this material in a cyclopedia of American Indians. It has also issued the voluminous publications already alluded to, which contain information of importance with regard to the political dealings of the United States government with the Indian tribes. In addition, researches are conducted among the natives of Hawaii.

Astrophysical Observatory.—The Astrophysical Observatory was established in 1890 under the immediate direction of the present secretary. It has been devoted, in the main, to researches in regard to that invisible portion of the solar spectrum which lies beyond the limit of the red. This work, first rendered possible by Mr. Langley's invention of the bolometer, has been carried still further, resulting in a great map of the infra-red solar spectrum completed in 1899, which extends our knowledge of the spectrum to many times that known to Newton. It is believed that these studies will prove of great practical importance, since they have to do with that region of the spectrum which includes the greater portion of the energy of the sun, which through its heat affects climate and crops. Important expeditions were sent out in 1900 and 1901 to observe the total solar eclipses of those years, and especially valuable results were obtained at that of 1900, including photographs of the solar corona of unexampled size and excellence. An expedition was planned to enlarge the work of measuring solar radiation, by establishing a station in South America. Owing to war conditions this has been stationed temporarily at Hump Mountain, N. C. (1917).

National Zoological Park.—The National Zoological Park was established by Congress in 1890 at the initiative of the present secretary, to secure the preservation of such American animals as are upon the verge of extinction, and also for the pleasure and instruction of the people. The park is situated upon Rock Creek, two miles north of the centre of the city, and has an area of 167 acres, being four times as large as the Zoological Garden at London. It is amply supplied with water, and its surface is of a varied and picturesque character. The collection comprises 1,225 animals, mostly American species. A hospital and laboratory were established in 1917.

Summing up what has been said about the Smithsonian Institution, we see that it occupies the exceptional position of a ward of the government, its regents expending its own income, which is largely supplemented by direct government grants for its museum and other bureaus; while through its extended system of publications, its library and its means for encouraging research and diffusing knowledge, through a body of over 30,000 correspondents abroad and approximately half that number at home, it occupies its actual place in the scientific activities of the day.

Consult 'The Smithsonian Institution, 1846-96, the History of its First Half Century,' edited by George Brown Goode; and subsequent Annual Reports.

SMITHSONITE, in *mineralogy*, native carbonate of zinc (ZnCO_3). It crystallizes in rhombohedral system with perfect cleavage, and is found also in reniform botryoidal and

stalactitic masses; and again granular to compact massive or earthy. In this latter form it is impure and varies from grayish-white to dark gray-brown, brownish-red or brownish-black, and is known as "dry bone" by American miners. In the purer forms it has a vitreous lustre inclining to pearly with the color varying from white to grayish, greenish or brownish, a white streak and a translucent to almost transparent character. Its hardness is 6 per cent the scale, and its specific gravity 4 to 4.45. In the United States it occurs in New Jersey, near Franklin Furnace, Pennsylvania, Wisconsin, Minnesota, Missouri, Arkansas and other States. The name is also sometimes applied to calamite ($\text{H}_2\text{Zn}_2\text{SiO}_4$), which is a yellowish or brownish zinc silicate, and an important ore.

SMITHWORK. See METAL WORK.

SMOCK, John Conover, American geologist: b. Holmdel, N. J., 21 Sept. 1842. He was graduated at Rutgers College in 1862 and later studied at the Mining School, Freiburg, and at the University of Berlin. Since 1871 he has been professor of geology at Rutgers. He was connected with the geological survey of New Jersey in 1864-85; was State geologist in 1890-1901; and in 1901-15 he was a member of the board of managers of the New Jersey Geological Survey. Author of 'The Climate of New Jersey' (1881); 'Building Stone in New York' (1888); 'Geological Survey of New Jersey' (Vols. III, IV), etc.

SMOHALLA, *shmó'hā'la* (correctly *SHMOQŪLA*, "The Preacher"), American Indian prophet and religious leader: b. about 1815; d. 1907. He was of the Sokulk tribe, cognate to the Nez Percés, and living near the Priest Rapids on the Columbia River in eastern Washington. He early received religious instruction at a Roman Catholic mission, afterward became a warrior and about 1850 began to preach. He then wandered away from his people, reached as far south as Mexico and returned through Nevada. He announced upon his return that he had been absent in the spirit world and had returned with a message. The Indians were commanded by the Great Spirit to return to their native manner of living, have no dealings with the whites, retain their land and live according to the will of the Great Spirit as revealed by Smohalla, who received such communications while in a trance. The cult became known as the "Dreamers" and gained a great following, including Chief Joseph and his tribe, the Nez Percés, and eventually became sufficiently strong to interfere with government reservation rulings. Investigations were made in 1870 and again in 1884 with a view to keeping the Dreamers within legal bounds.

SMOKE, the exhalation or visible vapor that arises from a substance burning. In its more extended sense the word smoke is applied to all the volatile products of combustion, which consist of gaseous exhalations charged with minute portions of carbonaceous matter or soot; but, as often used in reference to what are called smoke-consuming furnaces, the term is frequently employed to express merely the carbonaceous matter which is held in suspension by the gases. The flames from burning metallic substances are also called smoke. With forced

draft there is a great deal of waste in smoke, and engineers have given great study to the problem of reducing such waste, and wholly consuming the fuel, especially coal. A variety of contrivances, known as smoke-consumers or smoke-burners, have been introduced for this purpose. (See SMOKE NUISANCE). When the U-boats began to be dangerous to shipping, navigators turned their attention to means of producing a very thick and heavy smoke, which would screen a vessel from observation, and render it impossible for an enemy to aim with accuracy, not knowing where within the smoke their target was located.

SMOKE ('Duim'). Although Turgénief usually spent a part of every year in Russia, his home from 1863, the year following the publication of 'Fathers and Sons,' was in Baden-Baden until 1870. He was so disappointed by the harsh criticisms of his novel, by the way it was misunderstood and by the consequent coldness of former friends that he even contemplated abandoning literature. But in 1867 'Smoke' appeared in the *Russky Vvestnik*, again arousing great animosity and bringing against him charges of caricaturing the young generation, and of insulting his own country. Some thought that its satire was an act of revenge. The scene is laid at Baden-Baden, whither come the various characters, always chattering, without, as he expresses it, a single word of sincerity, a single intelligent thought, a single new fact amid all the incoherencies; with no enthusiasm, no genuine passion but pseudo-civic indignation, pseudo-scornful indifference. The leading character, Grigory Mikháilovitch Litvinof, of decent family and moderate means, is in Baden awaiting the arrival of his cousin, Tatyána Petróvna Shéstova, who is to be his wife. Litvinof is discovered by a Moscow acquaintance, who insists on introducing him to every Russian in Baden, and this enables Turgénief to indulge in his bitterest satire. Litvinof encounters his former fiancée, Irina Pávlova, now married to General Ratmirof. By the time Tatyána Petróvna arrives, Irina has succeeded in throwing her malign fascination upon him. He breaks with his cousin, and is ready to elope with Irina, but their plan fails, and he leaves Baden-Baden competely disillusioned. As the train bears him away, the smoke and steam from the engine drift by the window, now hiding the landscape, now giving a glimpse of gray skies and the misty Rhine Valley: "He was alone in the carriage, with no one to interrupt him. 'Smoke! smoke!' he said to himself several times. And suddenly everything seemed to him to be smoke—everything, his own life, everything human, especially everything Russian. 'Everything is smoke and steam,' he thought, 'everything seemingly goes through constant change; everywhere there are new forms, phenomenon succeeds phenomenon, but in reality all things are exactly alike; everything is rushing to some unknown end and everything vanishes, leaving no trace. . . .'"

And as he recalls the heated arguments, the futile chatter of his expatriated fellow-countryman, he realizes that his own aspirations and feelings are merely smoke like everything else.

The interest of the story centres on Irina, who is typical of the brilliant unscrupulous man-

chaser, cold and calculating, the Vampire of Society, made so by her environment and by false education. Litvinof is pallid in comparison with Bazánof and not so fresh and charming as Arkády. The other characters are individual, but none of them is interesting except as illustrating the ebullient Russians of the early sixties. 'Smoke' was translated into English under the title 'Smoke, or Life at Baden' (anonymous, London 1868); by W. F. West from the French version (1873). It is also in the five-volume edition of Turgénief's 'Works' (London 1874-75). It is to be found in Mrs. Constance Garnett's complete edition of the works from the Russian in 15 volumes (London 1894-99), and in Miss Isabel Hapgood's version (New York 1904), also from the original. None is very satisfactory as representing the literary perfection of the author's style.

NATHAN HASKELL DOLE.

SMOKE-BALL, a ball filled with a slow-burning composition, that emits a dense smoke, used by the navy to blind an enemy and mislead their fire.

SMOKE NUISANCE. Various measures have been taken both in England and the United States to overcome the evil effects of soft coal smoke, especially in large cities. In 1875 a Public Health Act was passed in England to prevent nuisance from smoke in towns which provided that all fireplaces, furnaces and chimneys (exclusive of the chimneys of a private dwelling) must be so constructed as to consume their smoke, under a penalty not exceeding \$25 nor less than \$10, on a second conviction \$50. Similar laws apply to railway locomotives and river steamers. In the United States various laws have been passed by State legislatures and ordinances by municipal bodies. But these enactments have only been partially successful. There are many practical difficulties in the way of consuming smoke, but experience has shown that none of them are insuperable. The principle involved is that of mixing air with the combustible vapors and gases generated by the action of heat on the fuel, so that, by virtue of a due supply of oxygen at the correct temperature they may be made to burn with flame, and become entirely converted into incombustible and invisible vapors and gases. The increased use of gas and electricity tends toward a solution of the problem in cities. Consult Popplewell, 'Consumption of Smoke'; Mellon, 'Smoke Investigation BuHetins' (Pittsburgh 1912, 1913, etc.); Barr, W. M., 'The Combustion of Coal and the Prevention of Smoke' (New York 1913).

SMOKE-STACK, a stack or funnel, usually of sheet steel, placed on boilers, locomotives, etc., to carry off the gases of combustion. Also the tall draft-chimney of a factory, smelter, etc.

SMOKE-TREE, an arborescent shrub (*Cotinus*, or *Rhus cotinus*) indigenous to Europe, and also called Venetian Sumach; or the similar American species (*Cotinus cotinoides*). They are shapely, tall and much branched and have oval leaves and terminal, large, loose panicles of greenish, polygamus five-parted flowers. These are chiefly abortive, and the

long pedicels become very plumose in fruit, and seem to smother the plants as by smoke, with their feathery soft masses, which are pale green or reddish in hue. The soft orange-colored wood yields a valuable dye-stuff called young fustic, and the leaves of the European species are used in tanning. Other names are the mist-tree and smoke-plant.

SMOKELESS POWDERS are the modern explosives which have replaced black gunpowder for use as propellents in guns. Such powders are styled smokeless because they give rise to comparatively little smoke when fired. This is due to the fact that the products of their combustion are practically all gaseous at the temperature of explosion. Black gunpowder gives rise to much smoke when fired because 57 per cent by weight of the products of its combustion form solid matter on cooling and, therefore, precipitate rapidly out of the atmosphere. While smokelessness or smoke-weakness offers, for many military purposes, the distinct advantage that it permits of a clear atmosphere being maintained during an engagement; that it delays the enemy in locating the spot from which a shot was fired; and that such powders do not readily foul the bores of the guns in which they are used, these modern powders possess the still more important advantage that weight for weight, they are much more powerful than black gunpowder. In consequence of this we not only by their use are able to impart higher velocities to our projectiles and thus secure flatter trajectories, greater ranges and better penetrations than were before possible, but the soldier or the ammunition wagon now carries less weight for the same number of rounds of ammunition or a greater number of rounds of ammunition for the same weight. The earliest experiments with smokeless powder were made by the English chemist, Howard, in 1800, when he tested the properties of his newly-discovered mercuric fulminate and found that though this violent agent produced little smoke, imparted a low velocity to the projectile and but a slight recoil to the piece, it burst the chamber and demonstrated its unfitness to compete with gunpowder as a ballistic agent, though it has found a limited use, when mixed with solid diluents which act as restrainers, in ammunition for parlor rifles, and it is noticeable that when firing this ammunition there is little smoke and a scarcely audible report attending the discharge.

The next step was taken when, soon after the discovery of guncotton, in 1845, attempts were made to use this material, in its fibrous condition, as a propellant. These experiments were made in Germany, France and England, while a very extended series were carried on by Major Mordecai of the United States army, at the Washington arsenal; but the material, owing to its fibrous form and the imperfection in its manufacture, proved too brisant and too irregular in action and it was so unstable as to undergo dangerous decomposition in storage so that it was not adopted. The material had, however, been proved to possess so many valuable qualities that it continued to be the subject of study by many chemists and especially Baron von Lenck of Austria and Sir Frederick Abel of England, the latter devising a method of

purification by reducing the guncotton to a pulp or dust. Besides affording a means for the better washing of the guncotton this pulverulent condition permitted of the dust being formed into grains and a patent was issued to Abel in 1866 for the production of powder by agitating this pulp in a vibrating vessel, with or without a binding material, whereby the pulp was formed into granules of different sizes which were subsequently sorted. The grains thus produced were quite soft, easily crushed when dry and readily absorbed water. In 1882 Reid and Johnson of England improved the process by moistening the dried grains with a volatile solvent which on evaporation left the surfaces so hardened as to better resist crushing and the absorption of water from the atmosphere. During this time superficially hardened soft grained powders composed of mixtures of different cellulose nitrates or nitro-lignins together with unnitrated material and nitrates such as sodium or barium nitrates came into use as smokeless sporting powders under the names among others of Schultze, E. C., Brackett's, J. D., and American Wood powders. These powders were, from the method of their manufacture, quite bulky and are, therefore, also classified as bulk powders.

In 1886 Vielle in France produced the first military smokeless powder of the modern class, by gelatinizing a mixture of cellulose nitrates only, or these mixed with barium and potassium nitrates as oxidants and sodium carbonate as a neutralizer, with ether-alcohol or some other solvent. When the solids and the solvents were intimately mixed and gelatinization was complete the plastic mass was rolled out into sheets, cut into strips and dried, by which a dense powder, which was hardened throughout, was produced. This powder was styled Poudre B when it consisted of cellulose nitrates only or Poudre BN when it consisted of these nitrates mixed with the inorganic salts named above. In 1888 Nobel in France discovered that by the aid of camphor or benzene he could effect the solution of as much as 40 per cent of nitro-cotton in nitroglycerin, forming a plastic mass which when rolled out into sheets and dried formed a mass resembling india rubber. This was cut in blocks or strips or flakes and was known as ballistite. As adopted in Italy the plastic mass was squirted through spaghetti machines forming cords which were cut into the desired length and the powder in this form was known as Filite.

In 1889 Abel and Dewar in England made a plastic mass from nitroglycerin, nitro-cotton, guncotton and tannin, dextrine or vaseline, and as it was made up into cords, it was called Cordite. In making this powder the gelatinization was effected by using acetone as a solvent, the mixture being kneaded to a dough in a water-jacketed kneading machine. The gelatinized mass was compacted in a mold by a preliminary press, and the mold transferred to a spaghetti machine, or stuff press, where the explosive was squirted into strands. As these strands issued they were reeled on bobbins which were placed in the drying house so as to drive off the solvent. When dried the product of 10 pressings was wound from 10 one-strand reels on to one 10-strand reel and then the cordite on six 10-strand reels was wound on

a drum making a cord of 60 strands, which when cut in short lengths formed the 30.5 grains charge for the magazine rifle. For higher calibres the cords as squirted were of larger diameter and were cut into desired lengths as they issued from the stuff press, dried and made up into bundles or fagots. Cordite is an elastic rubber-like mass with a light to dark brown color. Other nitroglycerin-cellulose nitrate powders are amberite. Maxim's powder, Maxim-Schupphaus powder, Leonard's powder, P. P. G., Peyton's powder and German smokeless powder. These powders differ in the proportions of their ingredients or in containing blended cellulose nitrates, or else castor oil or lycopodium or urea in addition to the other ingredients or they differ in the form of the grain. Thus Maxim perforates his grain, making it a tube, or he makes several longitudinal perforations, getting "multiperforated grains," while Gathmann cuts slots in the sides of the multiperforated grain to serve as vent holes through which the gases accumulated in the longitudinal canals may escape, and the breaking up of the grains by the accumulated pressure be prevented.

In 1890 Richard von Freeden of Walsrode, Germany, discovered that gelatinized cellulose nitrate if immersed in water underwent a kind of coagulation and division into small lumps which latter was promoted by stirring, and he based upon this a method of manufacture by which dense small grained powders that are hardened throughout could be produced. This product is known as Walsrode powder. Later Dupont accomplished the same result by throwing his pulped cellulose nitrate into a churn containing the gelatinizing solvent mixed with a large volume of water and containing potassium and barium nitrates in solution, and thus produced the Dupont smokeless powder. Similar to these, and likewise used for sporting purposes, are the Oriental and Hazard smokeless powders. In 1890 Charles E. Munroe pointed out that all powders, either gunpowders or smokeless powders made up to that time, consisted of mixtures of different materials, even the straight cellulose nitrate powders being made of mixtures of different nitrogen contents, and he set forth the novel principle of powder making that the finished powder should consist of a single chemical substance in a state of chemical purity and this was realized in the smokeless powder which he styled Indurite and which was popularly known as United States Naval smokeless powder. As made it consisted only of cellulose nitrate of the highest nitration in an indurated condition and resembled ivory. It was made in the form of flakes for small arms and in the form of macaroni for large calibres. The smokeless powder for the United States navy and army as made to-day consists of cellulose nitrate of medium nitration, gelatinized with ether-alcohol, a small percentage of diphenylamine being incorporated to serve as a stabilizer, the ether-alcohol evaporated and the plastic mass made into perforated cylindrical grains which are translucent and the color of amber. Because of the shortage of cotton during the Great War pulp wood was resorted to as a source of cellulose for smokeless powder, and very satisfactory powder was made from it in the United States and Germany.

Flashless Powder.—When smokeless powder is fired it gives a much more brilliant flash than ordinary gunpowder does and therefore when discharged after dark the position of a piece may be located by this flash. Because of the superior intensity of sunlight this flash is not ordinarily perceived by the naked eye during daylight but during the Great War light screens have been devised by which to sift out this flash light from the sun light so as to locate the gun. To defeat this chemicals have been introduced into the powder by which to reduce or obscure the flash. The sodium and potassium resins were so used but amids and carbonates have been found still more efficient.

Progressive Smokeless Powder.—With increasing calibres and lengths of guns it becomes of increasing importance to secure a progressive rate of burning of the powder grains so that after the projectile has been moved from its seat it shall be given a constantly increasing acceleration as it traverses the chase. The powder grains are perforated and their density varied with a view of securing this result but, since with large calibres these are insufficient, the coating of the grains with restraining substances has been resorted to, very good results having been obtained with dimethyl-diphenyl-urea which substance is for convenience styled "Centralite."

CHARLES E. MUNROE.

SMOKY HILL RIVER, or SMOKY HILL FORK, the source is in eastern Colorado and it flows into the State of Kansas through Wallace, Logan, Gove, Trego, Ellis, Russell, Ellsworth, McPherson and Saline counties. About 10 miles west of Abilene unites with the Solomon River and forms the Kansas River. It is over 500 miles long and traverses a prairie region noted for its fertility.

SMOKY MOUNTAINS, or GREAT SMOKY MOUNTAINS, on the boundary of North Carolina and Tennessee; a part of the Appalachian system, about 50 miles in length and 25 to 50 miles west of Asheville, N. C. The highest peaks are Mount Guyot, 6,636 feet high and Clingman's Peak, 6,660 feet high. This mountain is the scene of one of Mary Noailles Murfree's (q.v.) stories, 'The Prophet of the Great Smoky Mountain.' The region is highly picturesque and nearby towns are favorite winter resorts.

SMOKY QUARTZ, a smoky-yellow to brown and black variety of the mineral quartz. It is often transparent and then yields gems of considerable beauty. Cairngorm (q.v.) is a yel-

lowish variety. Morion is nearly black. The crystalline smoky quartzes include many familiar gem stones, as bloodstone, agate, jasper, carnelion, chalcedony, onyx, etc. Magnificent crystals weighing as much as 250 pounds have been found in Switzerland; very choice crystals, sometimes of large size, occur in Maine, North Carolina, Montana and Colorado.

SMOLENSK, smō-lěnsk', Russia, (1) Capital of Smolensk, on the Dnieper, about 250 miles west southwest of Moscow. It occupies steep slopes, rising from the river's edge and is surrounded on the left bank by a wall; on the right bank by earthworks. A large open square occupies the centre of the town. There is a cathedral of the 17th and 18th centuries, on the site of an earlier structure that was blown up in the Polish siege of 1611; also an episcopal palace, seminary, gymnasium, schools, three public libraries, a museum containing valuable antiquities, theatre and several philosophical and scientific societies. It has manufacturing of linen, leather, hats, carpets and soap. Trade is chiefly in corn and hemp. Smolensk was an important town in the 9th century; a strong fortress in the 14th century and in 1812 was taken from the Russians by Napoleon and destroyed by fire. Pop. 71,311. (2) The government organized early in the 11th century and a part of Lithuania in the 15th century, has been Russian since 1654 and now contains 21,632 square miles. It is largely covered by forests. The Dnieper River has its headwaters here and there are numerous streams flowing both north and south. Rye and oats are the chief cereals, flax and hemp are grown extensively, also potatoes. The mining of phosphorite is an important industry, and also the manufacture of lumber and paper. Swine are raised. Pop. 2,050,200.

SMOLENSKY, smō-lyěń'skī, or **SMOLENSKIN**, Perez, Russian Hebrew author and nationalist: b. Monastyrshchina, government of Mogilov, Russia, 25 Feb. 1842; d. Meran, Austria, 1 Feb. 1885. He early gained a knowledge of modern Russian and Hebrew literature and eventually abandoned orthodox Judaism in favor of Jewish nationalism. He traveled throughout Europe studying the problems of the Jews and striving to arouse the people of his race to the desirability of their being united politically. He argued the Messianic era to mean the political and moral emancipation of the Jews. In 1868 he established at Vienna a weekly periodical *Ha-Shahar* ("Daybreak") in which he expressed his views. He was deeply interested in the colonization of Palestine in 1880 and was bitterly disappointed at the antagonism manifested toward it by the Alliance Israélite Universelle. He was author of much miscellaneous matter and of several novels dealing with Jewish life, of which the most important is 'Am 'Olam' (1873), which contains the outline of the Jewish Nationalist movement.

SMOLLETT, Tobias George, English novelist: b. near Dumbarton, Scotland, 1721; d. near Leghorn, Italy, 17 Sept. 1771. He belonged to a family of Scotch lairds seated at Bonhill, near Dumbarton, in the picturesque valley of the Leven. His grandfather, Sir James Smollett (1648-1731) represented Dumbarton in the old Scots parliament and helped

frame the act of union with England in 1707. The laird's youngest son, Archibald, weak and improvident, married Barbara Cunningham, a proud and ill-tempered woman with little or no fortune. Of this marriage were born three children, of whom the last, Tobias George, was christened on 19 March 1721. Two years later the boy's father died, leaving wife and children to the charity of the old knight. After the usual schooling at Dumbarton, the future novelist was apprenticed to John Gordon, a physician and apothecary at Glasgow, and was permitted at the same time to attend lectures at the university, where he seems to have learned his Latin and Greek. In his 18th year he wrote a play called 'The Regicide,' based like Rossetti's 'King's Tragedy,' upon the murder of the first James of Scotland.

In 1739, Smollett set out for London, tragedy in pocket, to make his fortune by literature. The play was submitted by Lyttelton, the patron of letters, by whom it was perhaps passed on to Garrick. But it never reached the stage, for which it was ill-adapted, notwithstanding the author's loud denunciation of those who thought so. Smollett now entered the navy as a surgeon's mate and took part in the expedition under Admiral Vernon against Carthage and the sea power of Spain in America. While at Jamaica, he fell in love with a beautiful creole, Nancy Lascelles, daughter and heiress of an English planter, whom he married then or after his return to London. In 1744 he settled in Downing street and began the practice of surgery. From time to time he wrote odes and satires. His 'Tears of Scotland,' occasioned by the cruelties of the English at the battle of Culloden, awakened popular sympathy for "helpless Caledonia." In 1748 he suddenly came to his fame with 'Roderick Random,' a story of adventure on land and sea following in general outline the career of Smollett himself from the day he left Leven-water. With half its literary merits, it would have been read for its daring personalities and fierce exposé of the dreadful condition of the British navy. Its popularity was quite sufficient to float the next year an edition of the unfortunate 'Regicide.' At the same time appeared Smollett's translation of 'Gil Blas.' A trip to France furnished material for 'Peregrine Pickle' (1751), containing attacks so brutal on Lyttelton, Garrick, Akenside and Fielding, that the author modified or cut them away for a second edition.

In 1750 Smollett obtained the degree of M.D., from the University of Aberdeen and tried to establish himself at Bath. Failing in this last attempt to gain patients, he returned to London and took an old Elizabethan mansion at Chelsea. Here, during the next 10 years he performed, single-handed or by the aid of assistants, an enormous amount of work. The mills never stopped grinding. The 'Adventures of Ferdinand Count Fathom' (1753) was succeeded by a translation of 'Don Quixote' (1755) and a 'Compendium of Voyages' (1756) in seven volumes. A play called the 'Reprisal or the Tars of Old England' Garrick brought out for him at Drury Lane early in 1757. For a complete 'History of England' in five volumes (1757-58) he required only 14 months. Revised, enlarged and issued in sixpenny parts, Smollett's history threatened

to drive Hume out of the market. Under Smollett's supervision appeared also 'The Present State of All Nations' (1764) in eight volumes and a translation of the entire works of Voltaire. On the founding of the *Critical Review* in 1756, he assumed the editorship. For this monthly he wrote many slashing articles, one of which led to a short imprisonment for defamation of character. He also edited *The British Magazine*, where first appeared as a serial his 'Adventures of Sir Launcelot Greaves' (1762). This manner of publication was an innovation. Smollett's work as editor closed with the short-lived *Briton* (1762), an organ of the Tory party.

Under the pressure of work and grief for the loss of a daughter, Smollett's health broke down. The years 1762-65 were passed with his wife on the Continent, mainly in southern France and Italy. On his return he published a book of 'Travels' (1766), which, despite Sterne's ridicule of it in the 'Sentimental Journey,' displays much common sense. The 'Travels' out of the way, Smollett visited Edinburgh, where his mother was still living, and then went to Glasgow, and the romantic scenes of his childhood. A brief sojourn at Bath for Christmas (1766) and Smollett was back in London at his desk, writing 'The History and Adventures of an Atom' (1769), a savage satire on English politics since 1754. Completely broken in health after this effort, he hastened to Italy, where he settled in a villa near Leghorn. There he wrote his last novel, 'The Expedition of Humphry Clinker' (1771), based upon his recent tour of England and Scotland and planned, it would seem, while at Bath. He saw it in print but never lived to know of its great reception. He died 17 Sept. 1771 and was buried in the English cemetery at Pisa. Two years after his death appeared his characteristic 'Ode to Independence.' His wife, to whom he was fondly attached, remained at Leghorn, where she died in some distress about 1785.

Smollett was a man of rugged honesty. His irritable temperament, about which so much has been written, showed itself in his books rather than in his intercourse with friends. Visitors at Chelsea were surprised at his "polished and agreeable manners and the great urbanity of his conversation." His cynicism had the saving grace of humor. When he began his 'History of England,' he was a Whig; but he turned Tory during the process of composition, as the Whig ministers, on close examination, proved to be "a set of sordid knaves." His histories, compendiums and translations, though good narrative, have no further value. As a novelist, he seems, on first sight, to have added nothing to the art of fiction. Instead of beginning with Richardson and Fielding, he went back, as he said himself, to the loose narrative of Le Sage, which admitted of digressions and episodes, without number. For a consideration, he incorporated into 'Peregrine Pickle' the memoirs of a notorious lady of quality. He held too closely, it is said further, for the highest art, to his own experiences. His best known novels are not much more than autobiographies. All this may be granted. But there is the other side. In his early years, he cultivated verse-satire. Had he come a generation or two earlier, he would have been of the

company of Pope and Dryden. Coming after Richardson, he was the founder of the satirical novel. His work has immense scope, for it includes men, manners, art and politics at home and abroad. Of his successors, only Disraeli may be compared with him. He wrote our first novel of the sea and is thus a forerunner of Cooper. In 'Count Fathom' may be discovered the beginnings of the Gothic romance afterward practised by Horace Walpole and Mrs. Radcliffe. And 'Humphry Clinker,' "the most laughable story," said Thackeray, "that has ever been written since the goodly art of novel-writing began," brought into fiction that spirit of fun which later times have associated with Dickens. See HUMPHRY CLINKER.

Bibliography.—Among good recent editions of Smollett's works may be cited Saintsbury's (12 vols., London 1895), and Henley's (12 vols., London 1899-1901), both of which have introductory essays. The 'Works' with a memoir by the author's friend, Dr. John Moore (8 vols., London 1797) was reissued under the editorship of J. P. Brown in 1872-73. The most interesting of recent biographies is the 'Life' by D. Hannay in the 'Great Writers Series' (London 1887). Scott has a notable essay prefixed to Smollett's novels in the 'Novelists' Library' (London 1821), and Thackeray included him among the 'English Humorists.' The 'Cambridge History of English Literature' (New York 1913) contains an article by Harold Child, 'Fielding and Smollett' (Vol. X) with a fine bibliography.

WILBUR L. CROSS,

Professor of English, Yale University.

SMOOT, Reed, American legislator and Mormon leader: b. Salt Lake City, 10 Jan. 1862. He was educated at Deseret University, Salt Lake City, and at the Brigham Young Academy, Provo. He entered business and became prominent in various industrial enterprises in Salt Lake City and Provo. In 1895 he was appointed one of the presidency of the Utah Stake of the Church of Jesus Christ of the Latter Day Saints, and in 1900 an apostle of that Church. In 1903 he was elected to the United States Senate, but his right to a seat there was contested on the ground that as a high official of the Mormon Church he officially sanctioned polygamy in violation of the laws of the State of Utah, and an oath taken by the members of the Mormon hierarchy said to be inconsistent with loyalty to the national government and Constitution. The Senate by vote decided that he was entitled to take his seat. Since then he has been continuously re-elected. His term in the 65th Congress expires in 1921.

SMUGGLING, the practice of violating the revenue laws of a country by importing or exporting goods upon which duty is payable, with intent to avoid payment of that duty. It is a general custom in all countries to lay a duty on certain imported goods, while in some rare cases a duty is imposed on certain articles exported, as, for instance, some years ago an export duty of two shillings per ton was levied on coal from Great Britain. The phase of smuggling most frequently met with is the secret carrying through the customs of dutiable articles by passengers on ships and trains. Many ingenious methods have been employed to evade the vigilance of revenue officers, fre-

quently with success. Trunks and bags fitted with false bottoms and sides are the common tricks adopted, as well as skilful concealment of contraband on the person. Smuggling is actively carried on over boundaries where the frontier-lines of different countries meet. In such case it is more difficult to detect or prevent illicit importation. Besides introducing taxable goods without payment, smuggling includes the importation of articles that are prohibited from being brought into the country or district. Revenue-cutters are empowered to stop and search any vessel within four leagues of the coast of the United States, while on land any vehicle may be searched, if necessary by force, by authorized officials. Contraband goods thus seized are liable to forfeiture, while a penalty of treble the value of the stock may be imposed. Passengers arriving in the United States are required to make oath as to dutiable articles in their possession. The penalty for defrauding the customs knowingly or wilfully ranges from a fine not exceeding \$5,000 or two years' imprisonment. At the discretion of the court, both penalties may be imposed. The forfeited goods are sold, and the proceeds distributed between the government, the informer (if there is one in the case) and the officer who detected the offense. Where the owner of seized goods can establish innocence of intent to defraud, the property may be returned on payment of the duty. Smuggling is especially rife in countries where high or "protective" tariffs prevail. Under the free trade system in the British Isles smuggling is practically confined to spirits, tobacco and scent. Clothes, books, diamonds, lace, etc., are all admitted free of duty.

SMUTS, General Rt. Hon. Jan Christiaan, South African statesman and soldier: b. 1870. He was educated for the law at Victoria College, Stellenbosch; and Cambridge University, England; practised at Cape Town and Johannesburg and was appointed state attorney of the South African republic in 1898. When the Boer War broke out in 1899 he had already a great reputation among the South African Dutch, which was enhanced by his conspicuous services to their cause during the war. On the conclusion of peace in 1902 General Smuts was established with General Botha as one of the two recognized leaders of the Transvaal Dutch. The two men have worked together ever since, loyally accepting the Peace of Vereeniging and carrying on the administration of the Union of South Africa. In the European War, General Smuts commanded the columns of Union troops invading German South-West Africa from the South, and in 1916 he took command of the British forces operating in German East Africa. He organized the campaign which broke the German power in Africa and reduced the German commander von Lettow Vorbeck to the condition of a fugitive, though avoiding capture to the end of the war. General Smuts afterward represented South Africa in the Imperial War Cabinet in London during 1917-18 and, with General Botha, was one of the South African delegates at the Peace Conference in Paris.

SMUTS. See FUNGI; DUST-BRAND.

SMYRNA, smēr'na (Turkish, *IZMİR*), Asia Minor, an ancient city and the most important

seaport of Asia Minor, on the west coast of Anatolia, at the head of the Gulf of Smyrna (a sheltered inlet of the Ægean Sea extending inward for about 45 miles). A broad quay and artificial harbor, the former traversed by a tramway, borders the sea-front. The city is divided into four quarters—Frank, Turk, Greek and Armenian. The public buildings include the palace of the governor, a large barrack, a number of mosques and several Greek, Armenian, Roman Catholic, and Protestant places of worship, the British consular chapel, an American and two English churches. There is a British seamen's hospital here, for which a new building was erected in 1897. New waterworks were completed in 1898. Smyrna has been for centuries the most important place of trade in the Levant. This trade is carried on partly by shipping, partly by caravans from the interior, and is now supplemented by railways. The chief imports are cotton and woolen manufactured goods; colonial goods, mostly coffee and sugar; iron, coal, hardware goods, leather, timber, glass-ware, butter and margarine, drugs, jute bags, petroleum, etc. The principal exports are raisins, figs, valonia, cereals, tobacco, gum-arabic, opium, carpets, cotton, wool, liquorice, olive-oil. Smyrna has been frequently injured by earthquakes and has also suffered severely from fire. The climate is variable, and fever (usually of a mild type) is prevalent. There are conflicting accounts of the origin of this city; the most probable is that which represents it as an Æolian colony from Cyme. About 688 B.C. it fell into the hands of the Ionians of Colophon. This earliest city, called by the Greeks Old Smyrna, was situated on the banks of the Meles, on the northeast side of the Hermæan Gulf (now the Gulf of Smyrna). It laid claim to the honor of being the birthplace of Homer, and its coins bore his image. This old city was abandoned and was succeeded by a new town on the southeast side of the gulf (the present site), which was said to have been built by Antigonus, and enlarged and embellished by Lysimachus, both generals of Alexander the Great. It was laid out with great magnificence, and adorned with several splendid buildings, among which was the Homereum, where the poet was honored as a god. It soon became one of the greatest and most prosperous cities in the world. It was especially favored by the Romans on account of the aid it lent them in the Syrian and Mithridatic wars. In the civil wars it was taken and partly destroyed by Dolabella, but it soon recovered. It is one of the two among the seven churches in Asia which Saint John addresses without rebuke, and it was the scene of the labors and martyrdom of Polycarp. In the 13th century only the ruins of its former splendor were left; but after the Turks became masters of the country it began to revive until it became the most flourishing city of Asia Minor. As a result of the European War, Smyrna was handed over to Greece as the mandatory by the Peace Conference. Greece took charge of the city in May 1919. Pop. about 250,000, fully half being Greeks.

SMYRNA CAMP GROUND, Engagement at, in the Civil War. On the night of 2 July 1864, Gen. J. E. Johnston abandoned

Marietta for a new position 10 miles south, covering the railroad and his pontoon-bridges, with an advanced position at Smyrna Camp Ground, six miles below Marietta. Sherman pushed forward from Marietta on the morning of the 3d, hoping to catch Johnston before he could get his army across the Chattahoochee, and was much surprised when the head of Thomas' column ran up against strong works at Smyrna Camp Ground, covering the wagon-road and railroad. The army was deployed, and there was heavy skirmishing. On the 4th General Dodge, commanding the 16th corps, moved out on the Ruff Station road and developed a Confederate position of two intrenched lines, strongly held. Dodge intrenched. At 4 p.m. a charge was made by three regiments of Veatch's division, under Col. E. F. Noyes, and three regiments of Sweeney's division, resulting in the capture of Johnston's first line of works and over 100 prisoners, with a Union loss of 140 killed and wounded, Noyes losing a leg. During the night Johnston abandoned his advanced position and drew back all his army and trains to the intrenched line covering the railroad bridge. Sherman closed up against him and was met by a heavy and severe fire, then threw forward both flanks, and by morning of the 6th held possession of the river above for 18 miles, as far as Roswell, and 10 below to the mouth of the Sweet Water. On the 9th Sherman crossed a part of his army over the Chattahoochee, near Roswell, and that night Johnston abandoned his position, crossed to the south side of the Chattahoochee, burned the railroad bridge and his pontoon and trestle bridges and took position in the outer defenses of Atlanta. Consult 'Official Records' (Vol. XXXVIII).

SMYTH, Charles Henry, Jr., American geologist: b. Oswego, N. Y., 21 March 1866. He was graduated at Columbia University in 1888, took his Ph.D. there in 1890, and later studied at the University of Heidelberg. He was professor of geology and mineralogy at Hamilton College in 1891-1905, and since 1905 has occupied the chair of geology at Princeton University. He is author of many scientific papers.

SMYTH, smith or smith, Charles Piazzi, English astronomer: b. Naples, 3 Jan. 1819; d. 21 Feb. 1900. He was employed at the observatory at the Cape of Good Hope (1835-45); was astronomer royal for Scotland (1845-88); and retired on a pension in 1888. He made a most thorough examination of the great Egyptian pyramid and was led to the conclusion that the structure was raised under direct inspiration of God, and that therein were deposited revelations of the great truths of physical nature. He wrote 'Our Inheritance in the Great Pyramid' (1864); 'Life and Work at the Great Pyramid' (1867); 'Antiquity of Intellectual Man' (1868), etc.

SMYTH, Egbert Coffin, American Congregational clergyman and author: b. Brunswick, Me., 24 Aug. 1829; d. Andover, Mass., 12 April 1904. He was graduated from Bowdoin College in 1848, and from Bangor Theological Seminary in 1853. In 1862-63 he studied in Germany when he was called to Andover as professor of ecclesiastical history, and was for more than 40 years identified with the

growth of Congregationalism. From 1886 to 1892, as editor of the *Andover Review* he was involved in a religious controversy with the more orthodox clergymen of the denomination, but was upheld by his colleagues and the progressive members of the church at large. He was the author of 'The Divinity of Jesus Christ' (1893); 'From Lessing to Schleiermacher, or From Rationalism to Faith' (Boston Lectures 1870), and 'Influence of Jonathan Edwards on the Spiritual Life of New England' (1901), etc.

SMYTH, Herbert Weir, American classical scholar and educator: b. Wilmington, Del., 8 Aug. 1857. He was graduated at Swarthmore College in 1876, later studied at Harvard University and took his Ph.D. at the University of Göttingen in 1884. He was professor of Greek at Bryn Mawr in 1888-1901; was professor of Greek at Harvard in 1901-02, and has since been Eliot professor of Greek literature there. He was professor in the American School of Classical Studies at Athens in 1899-1900. He edited 'Greek Series for Colleges and Schools' (20 vols.). Author of 'The Sounds and Inflections of Greek Dialect: Ionic' (1894); 'Greek Grammar' (1914).

SMYTH, John Paterson, Canadian Anglican clergyman: b. Ireland, about 1856. He was graduated at Trinity College, Dublin, and was ordained a priest in the Church of England in 1881. He was professor of pastoral theology at Trinity College, Dublin, in 1902-07; became canon of Dublin Cathedral in 1907; and later went to Canada as rector of Saint George's Church at Montreal. He was appointed canon of Christ Church Cathedral, Montreal, in 1910, and archdeacon in 1914. Author of 'Israel's Prophets and Kings' (1906); 'The Prayer Book' (1908); 'The Bible in the Making' (1914); 'God and the War' (1915); 'The Men Who Died in Battle' (1915), etc.

SMYTH, Samuel Phillips Newman, American Congregational clergyman and author, brother of E. C. Smyth (q.v.): b. Brunswick, Me., 25 June 1843. He was graduated from Bowdoin College in 1863, and at Andover Theological Seminary in 1867. He was called to the First Congregational Church of Bangor, Me., and in 1882 to the First Congregational Church of New Haven, Conn. He is the author of 'Old Faiths in New Lights'; 'The Orthodox Theology of To-day'; 'The Morality of the Old Testament'; 'Christian Ethics'; 'Through Science to Faith'; and other books.

SMYTHE, Ethel Mary, English composer: b. London, 23 April 1858. She studied at the Leipzig Conservatory and later under Heinrich von Herzogenberg, and received the degree of Doctor of Music at Durham in 1910. Her early compositions included songs, chamber music, a mass in D which gained for her recognition as a composer of great ability, a sonata, and other pieces. Her reputation became firmly established with the production of her first opera, 'Fantasio,' produced at Weimar in 1898. She ranks as one of the leading composers of her time, and probably the first among women composers. Her second opera 'Der Wald' was produced at Dresden in 1901, at London in 1902, and at the Metropolitan Opera House, New York, in 1903. 'The Wreckers' was produced at Leip-

zig in 1906, and 'The Boatswain's Mate' (1915) was produced in London in 1916.

SNAIL-BORE. See DRILL.

SNAILS AND SLUGS, names restricted in their original application to gasteropodous mollusks typifying the families *Helicidae* and *Limacidae* respectively, but now used in a much wider sense. The terrestrial and fresh-water snails and slugs represent the order *Pulmonata*, characterized by the presence of a lung-sac for the respiration air formed by a fold of the mantle and opening by a conspicuous pore situated at the mantle border, usually on the left side. They are always asymmetrical, but have the visceral loop of the nervous system straight and the ganglia concentrated in a ring about the œsophagus. All are hermaphroditic, though the structure of the complex genital organs varies greatly. A shell is generally present, though absent or rudimentary in the slugs, and is usually dextral. Except in the brackish water *Amphibolidae* of New Zealand there is no operculum. Within the mouth is the jaw, usually single and placed just behind the upper lip, but in some forms there are accessory pieces and in others the jaw is absent. Both the jaws and the teeth on the lingual ribbon or odontophore present an astonishing variety of form which is characteristic of genera and species. With these organs the food, usually vegetable, is cut and rasped. Scarcely any of the *Pulmonata* are marine, and very few live in even brackish water, though a large number inhabit fresh water and some the depths of lakes, from which they never come to the surface to breathe air, but take water into the lung, which has, therefore, secondarily assumed the function of a gill. The great number of species are arranged in two sub-orders: the *Basommatophora*, which have non-retractile tentacles with the eyes situated at their bases and male and female organs opening separately, and the *Stylommatophora*, with retractile and often invaginable tentacles, two of which bear the eyes at their tips, and the genital orifices generally united. Each suborder includes numerous families, upon the exact number and arrangement of which authorities are not yet fully agreed.

As examples of the sessile-eyed snails the following may be selected, the generic names employed being in most cases in the less restricted sense. *Melampus lineatus* represents the family *Auriculidae*, and is one of the few marine species, inhabiting the salt marshes along the coast in great numbers. The shell is solid and sub-oval, with a polished surface of a handsome brown color marked with reddish bands. The *Limnæidae* are the common pond-snails, which have a very delicate fragile shell and the orifice of the lung protected by a special lobe. The species are very numerous and abound everywhere in sluggish fresh waters. *Planorbis* has the shell rolled in a flat spiral and thicker than usual in the family. A number of species are common in the sluggish rivers and streams of the United States, where they may be found attached to stones along with masses of their eggs. *Limnæa* is the type genus and is known by its rather slender, dextrally spiral, delicate shell with a large aperture. *L. stagnalis* is abundant in ponds, and other species are particularly well represented in the northern States and Canada.

Their eggs may be found imbedded in little packets of transparent jelly attached to aquatic plants throughout the summer. During seasons of drought these and other water snails burrow into the mud or close the aperture of the shell by a membrane formed of secreted mucus. They are strictly vegetarian and make useful and interesting inmates of aquaria. *Physa heterostrophæ* is equally common and has similar habits, but the very delicate shell is sinistral. *Ancylus* includes the fresh-water limpets, our species being very small, with flattened conical shells, which are found attached limpet-like to stones and plants in ponds. This group includes no slugs.

The stalked-eyed snails are more numerous and important. *Glandina truncata* of fresh-water swamps of the southern States belongs to the family *Testacellidae*, which are remarkable because of their carnivorous habits and the absence of a jaw. This species has a well-developed shell, but the related genus *Testacella* of Europe is a slug, bearing the small disc-like shell at the posterior end of the body. It attacks and devours earthworms and slugs, but also eats decaying animal matter. The true slugs belong to the family *Limacidae* in which the shell, if present, is usually buried in the mantle or else is a plate covering only a small portion of the animal. The visceral hump of the snails is absent or little developed in the slugs. The body is generally oval or oblong, elongated, from one to three inches in length. The creeping disc, or sole of the foot, extends the whole length of the animal, but, like snails, slugs frequently raise their heads and move their tentacles in search of objects above them. They often climb trees, and can lower themselves to the ground by the accumulation of mucus at the extremity of the tail hardening into a thread, and as they crawl they leave a slimy track. They oviposit in moist places in spring and summer, often at roots of grass; the eggs are laid in strings, each in a separate gelatinous envelope. Slugs are found in moist places in the woods, damp cellars, etc., and are especially partial to decaying wood, upon which they in part feed. But their chief food consists of the tender leaves and shoots of plants, and the garden species often inflict considerable damage upon lettuce, celery, etc., but much less in this country than in Europe. They may be checked by sprinkling wood ashes, lime or soot about young and tender plants or in cellars by sprinkling salt about their haunts. They are active at night and conceal themselves by day. During the winter they hibernate. Among the genera are *Arion*, *Agriolimax*, *Limax* and its numerous subdivisions. Several of our common garden and cellar species are European importations. *Limax maximus* is very common and four or five inches long, of an ashy gray color with black stripes and spots. It is sometimes eaten in England. *L. campestris* is very common in woods and meadows. It is much smaller and uniform pale gray or brown. *Arion fuscus*, a European species, has been introduced into this country in the neighborhood of Boston. The shell is concealed and very imperfect and there is a large triangular mucous pore near the posterior end. The eggs are said to be phosphorescent. *Philomycus carolinensis* is a large slug found under logs and bark in woods and which is often placed in

a distinct family. There is no trace of a shell and the mantle covers the entire back.

The *Helicidae* or family of true snails is an immense one, the typical genus alone in its unrestricted sense embracing about 6,500 species. They abound in moist places and have very similar habits the world over. They feed chiefly on vegetable substances, though they are very indiscriminate in their appetite and even devour the dead of their own kind. The mischief which they do to garden crops is too well known; and gardeners lay down cabbage leaves and the like to attract them, in order that they may be destroyed. Snails delight in warm, moist weather; in dry weather, their chief time of activity is during the night, and they hide themselves by day; but after rain they come forth at any hour in quest of food. At the approach of winter or in very dry weather they close the mouth of the shell with a membrane (epiphragm), formed by the drying of the mucous substance which they secrete, and become inactive and torpid. Snails retreat into crevices for the winter, or into holes which they make in the earth, and which are roofed over with earth, dead leaves, etc., agglutinated by secreted mucus. The eggs are deposited in moist earth, the snails often burrowing beneath the surface for this purpose and they have no jelly but only a slightly adhesive covering. Among the most plentiful of our native species are *Helix albolabris* and *H. alternata* and the minute *Zonites milium* (not closely related) found everywhere in damp woods. Several of the large European species have been introduced. The great vine snail, or edible snail (*Helix pomatia*), a European species, was considered by the ancient Romans one of their table luxuries. In some countries, as Switzerland and parts of France, they still form a considerable article of commerce. Together with *H. aspersa*, they are fed by thousands in places called "escargatoires," which are made on purpose for them. Preserved snails are imported into the United States for table use, and the demand has increased sufficiently to induce a few persons to inaugurate the business of raising them, particularly in California. On account of its large size and gregarious habits the European *H. pomatia* is best suited to this purpose. Another family of water snails (*Paludinae*) belongs to a quite different division of the *Gasteropoda*, the order *Prosobranchiata*. In these forms the usually single ctenidium is placed anterior to the heart, and the visceral nervous loop is twisted into a figure 8. The order is a very extensive one, most of the members of which are marine. With the *Valvatae*, *Ampullariae*, which are related fresh-water forms often placed in distinct families, the species of *Paludina* and *Vivipara* have the left ctenidium only and a single kidney and heart auricle. The shell is usually stout, more or less pyriform and has a well-developed operculum. The single pair of non-retractile tentacles bear the eyes upon lobes near their bases and the edge of the mantle forms a pair of short tubes by which water is directed over the gill. The sexes are always separate and the young are produced alive. Common species are *P. integra*, *P. intertexta* and *P. vivipara*, which live on the mud at the bottom of ponds and sluggish streams. They are, at least in part,

carnivorous. Other important fresh-water families are the *Pleuroceridae* and *Melaniidae*, including chiefly oviparous forms which have the thick shell variously ornamented with spines and tubercles. Of the numerous forms found in the mountain streams and eastern tributaries of the Mississippi and elsewhere the large and variable *Io spinosa* is an example.

Bibliography.—Pilsby and Tryon, 'Manual of Conchology' (Philadelphia 1878-1904); Binney and Gould, 'Terrestrial Air-breathing Mollusks of the United States' (Boston 1851 to 1859); Binney, Bland, Prime and Tryon, 'Land and Fresh-water Shells of North America' (Smithsonian Institution, Washington, 1865-73); Cooke, 'Cambridge Natural History' (Vol. III, London 1895); and for an excellent popular account Ingersoll, 'Wild Life in Orchard and Field' (New York 1903) See GASTEROPODA.

SNAKE, or LEWIS (the SHOSHONE of the Indians), a river which has its rise in the mountains of western Wyoming, in two streams, called the North and South Forks. Entering Idaho the river flows southwest, then northwest to the Oregon State boundary, then north, forming the boundary for 100 miles, between Oregon and Idaho to Lewiston, and the boundary between Washington and Idaho for 30 miles. It then turns westward, crosses the southeastern part of Washington and enters Columbia River near lat. 46° 12' N. and long. 119° W. Its length is estimated to be about 1,000 miles. Where the North and South Forks unite the elevation is 4,800 feet and at the mouth, where it enters the Columbia, it is 340 feet. Its course is through a mountainous country, here and there entering plains, winding around seemingly extinct volcanoes, passing through fertile lands in Washington. It is noted for its wonderful cañons, and in places for the springs that pour in great abundance from its northern wall. A fine exhibition of cataracts is furnished at the Thousand Springs near Hagerman, Idaho, between Salmon Falls and the point where the Salmon Falls River enters from the south. The springs in countless numbers issue from rocks far up the faces of nearly vertical precipices. The water does not make the descent in a single leap, but in a series of cascades. It is lashed into foam by contact with the rocks and the beauty of the scene defies description. The Shoshone Falls (q.v.) are among the wonders of the world. Many of the cañons of the river are from 1,000 to 3,000 feet in depth and the waters flow rapidly over irregular beds forming long rapids and magnificent cascades. A number of side alcoves, or short, "blind" cañons, leading off the main cañons, owe their existence to great springs. These side cañons receive no surface streams and there is no other explanation of their formation. The springs undermine the rock by removing the soft material on which it rests. The rock falls into the spring and gradually sinks into its soft bed and thus the cañons are formed. Often the undermining is on so large a scale that the falling rock becomes a landslide. The water in the streams which the springs form is intensely blue and very clear. Some of them are well stocked with trout, although on the edge of a desert.

SNAKE-BIRD. See DARTER.

SNAKE DANCE, a dance of religious character performed by the Moqui Indians, living in Arizona, United States of America. The dance is known to have been performed by this tribe of Indians, in the same manner and in the same place, ever since the middle of the 16th century, when the Spanish explorers entered this part of America. The rite is particularly revolting in some of its details, which include the bearing of live serpents in the hands and the mouths of the dancers. As many as 100 snakes are used in a dance and each of these is borne by the dancers while dancing, either in his hands or mouth, is then deposited upon the ground, where it is sprinkled with the sacred cornmeal by the Indian squaws, is picked up, held by old men, then by little boys, infants even, and is then deposited in a sacred tent lined with buffalo skin, inside of which a sacred tree is growing. Toward the end of the dance the snakes are taken out of the tent and carried in armfuls by the Indian men, are placed on the ground within a circle of sacred meal in front of a sacred rock. Here to the accompaniment of prayers and chants the serpents are sprinkled with the sacred cornmeal until the whole writhing, wriggling mass is completely covered by the meal. The dance concludes by the Indian men grasping each as many snakes as he can hold and dashing down a steep incline at top speed. At its foot the snakes are liberated, scattered in every direction. The ceremony is described as most revolting. For a full account consult Bourke, J. G., 'Snake-Dance of the Moquis' (1884); Hough, W., 'The Moki Snake Dance' (Chicago 1898).

SNAKE-DOCTOR, a dragon-fly (q.v.).

SNAKE-EEL, an eel of the large family *Ophichthidae*, scaleless, and with the extremity of the tail free, that is, not surrounded by a fin. These eels are found abundantly in tropical seas about rocks and coral reefs and are often gayly colored like murænas, to which they are allied. Consult Jordan and Evermann, 'Fishes of North and Middle America' (Washington 1896).

SNAKE-GOURD. See GOURD; MELON.

SNAKE-MELON. See MELON.

SNAKEROOT, the popular name of numerous American plants of different species and genera, most of which are, or formerly were, reputed to be efficacious as remedies for snake-bites. (For two prominent kinds see *ARISTOLOCHIA* and *POLYGALA*). The black snakeroot (*Cimicifuga racemosa*) is a common woodland herb, four to eight feet high, with long racemes of white flowers. The white snakeroot is a handsome herb (*Eupatorium ageratoides*) and belongs to the asters. It has large, coarsely serrated opposite leaves and is also known as white sanicle. The Seneca snakeroot (*Polygala Senega*) is of the milkwort family and common in the eastern United States. It has a heavy woody rootstock, several stems grow 6 to 12 inches high, alternating lanceolate leaves and perennial white flowers in spikes. The Brazilian snakeroot (*Chiococca augustifolia*) is a shrub of the madder family, the roots furnishing an emetic and cathartic assumed to relieve snake-bite. Sampson's snake-root (*Psoralea*

melilotoides) is a perennial of the bean family, growing in the southern United States. It is a stimulating tonic. The Canada snakeroot is the wild ginger.

SNAKE-STONE, a porous stone, as a fossil ammonite, or any porous substance, supposed to cure snake bites. The superstition came, it is believed, from Eastern countries. The stones, which are usually small, are supposed, when applied to a snake-bite, to absorb the poison, counteract the poisonous effects, or to charm the wound away. Some of the snake-stones used in India seem to be efficacious. Two small snake-stones (about the size of a pea) brought from that country and said to have cured a cobra bite, were found on examination to be composed of some vegetable substance. Another, which was brought from Ceylon by Sir J. E. Tennent, and which was known to have effected a like cure, was submitted to the examination of Professor Faraday, who fancied it to be a piece of charred bone which had been filled with blood perhaps several times and then carefully charred anew. Owing to their absorbent properties such stones, if applied at once, may be of some avail. The superstition is particularly prevalent among the negroes of the southern States and in some portions of England and Scotland where charms made of small stones perforated and strung like beads are hung on cattle to keep awayadders and to cure any snake-bites.

SNAKE-WOOD, any of various woods and plants. One is the small South American tree (*Brosimum aubletii*) which has hard, white sapwood surrounding the valuable heart, which seldom exceeds seven inches in thickness, is reddish and marked with black in such a manner as to suggest hieroglyphics; the spots have suggested such other names as letter-wood and leopard-wood. It is used for walking canes, veneers and cabinet-making. *Strychnos colubrina*, a climbing plant of India, like the *S. nuxvomica*, yields in its bitter roots and wood, a reputed native cure for snake-poison. *Colubrina ferruginosa* (West Indies), so called, perhaps, from its twisted grain, *Plumeria rubra* and *Cecropia peltata*, are also called snake-wood.

SNAKES. See SERPENTS.

SNAP-DRAGON, cultivated species of the genus *Antirrhinum* (*Scrophulariaceæ*). *A. majus* is the common snap-dragon, a pubescent perennial, native to Europe, with linear lanceolate leaves, chiefly alternate and large showy flowers, having irregular gibbous, two-lipped corollas, the lower, three-lobed lip so swollen at the base as to nearly close the throat of the flower and giving an appearance so like a mouth that it has suggested many descriptive names, such as bulldog's, rabbit's, dog's or toad's mouth; even the Greek name means "nose-like." They are handsome herbs, one to three feet high and have flowers of many shades and markings and are not only cultivated in old-fashioned hardy gardens, but in greenhouses for winter floral trade. The plant is reputed, in folk-lore, to have the power of destroying charms. The Jamaica snap-dragon (*Ruellia tuberosa*) is of the acanthus-family, bears a pretty blue flower and is cultivated in hot-houses.

SNAPPERS, a rather numerous assemblage of fishes belonging to the genus *Lutjanus* and related genera, usually considered as belonging to the family *Sparidae* (q.v.), but sometimes erected into a distinct family (*Lutjanidae*). They have the body more elongated than the typical members of the *Sparidae*, the teeth little differentiated and never incisor-like, though some are usually enlarged and caniniform and there are always teeth on the vomer. The dorsal fin is continuous, with strong spines and the anal fin has three stout spines. The species of *Lutjanus* inhabit most warm seas and about 20 are found in our southern waters, some of them attaining importance as food fishes. The red snapper (*Lutjanus aya*) is a handsome rose-red fish, the young with a black blotch on the side. It attains a length of 2½ feet and a weight of 25 pounds, and is economically the most important of the group. Throughout the West Indian region and in the southern United States it is a great favorite, and is shipped to northern markets also in considerable numbers. The centre of the fishery is Pensacola, from which smacks visit the snapper banks in various parts of the Gulf of Mexico. The gray or mangrove snapper (*L. griseus*) is another abundant and widely distributed species throughout the same region and sometimes strays northward as far as Cape Cod. It is of a dark green color above and reddish below and is further distinguished from the red snapper by the much lower ventral fin. Being smaller than the latter it is of less commercial importance, but because of its greater abundance in shallow waters is an even greater favorite with amateur anglers. A third species is the mutton fish (*L. analis*). This is a beautiful fish in life, being olive green above, with red fins and pale blue spots and streaks on the head and sides. It equals the red snapper in size and, like the other species, frequents rocky banks and spawns in summer. It is said to be the most important food fish in Havana. All of the snappers are gamy and are caught chiefly on hand lines, but in Jamaica and other West Indian islands in cane fish-pots constructed on the principle of lobster-pots. Consult Jordan and Evermann, 'American Game and Food Fishes' (New York 1902); Jordan, D. S., 'Fishes' (New York 1908).

SNAPPING TURTLE, a large freshwater turtle (*Chelydra serpentina*), widely distributed over the United States. These voracious creatures grow to a considerable size, a weight of 20 pounds being far from uncommon, and are prized as food. Their popular name is derived from their ferocity in captivity, and their habit of biting or snapping at everything that comes in their way. Called also alligator terrapin and alligator tortoise.

SNARE OF LOVE, Order of the. See ORDERS AND DECORATIONS (ROYAL).

SNATCH BLOCK, a single block; that is a block or case carrying a single pulley, in use on ships. It has an opening (notch) in one cheek to receive the bight of a rope. The block is iron-bound, with a swivel hook. The portion of the strap which crosses the opening or snatch in the block is hinged, so as to be laid back when the bight of the rope is to be inserted, as when warping the ship. This saves the trouble of reeving the end of the rope

through. Large blocks of this kind are called rouseabout blocks, also viol blocks. Double and triple sheaved blocks are sometimes made with a snatch.

SNAYERS, Peter, Dutch painter: b. Antwerp, 1592; d. Brussels, 1667. His teacher of painting was S. Vranx; he was elected to the Guild of Saint Luke in 1613, and went to Brussels as court painter in 1628. Of his numerous battle pieces, the majority were painted for the Austrian Court, of which works 12 are now in the Imperial Gallery at Vienna. His other canvases represent cavalry skirmishes, small war scenes, hunting scenes, landscapes, painted with life-like expression and action. His works are found in most public galleries and are especially well represented in Dresden and Madrid, 16 being hung in the Prado.

SNEATH, E. Hershey, American educator and author: b. Mountville, Pa., 7 Aug. 1857. He was graduated at Lebanon Valley College in 1881 and received the degrees: A.B., 1881, A.M., 1885 and LL.D., 1903, Lebanon Valley College; B.D., 1884, and Ph.D., 1889, Yale University. From 1889 lecturer and professor of philosophy; since 1912 he has been professor of the philosophy of religion and religious education in Yale University. He organized the 'Modern Philosophers and the Ethical Series,' and is author of 'The Philosophy of Reid' (1892); 'The Ethics of Hobbes' (1898); 'The Mind of Tennyson' (1900); 'Philosophy and Poetry' (1904); 'Wordsworth — Poet of Nature and Poet of Man' (1912). Joint author with Dean Hodges of a manual, 'Moral Training in the School and Home.' Organized and is one of the editors of 'The Golden Rule Series' (6 vols.) and 'The King's Highway Series' (8 vols.); the former representing a graded system of moral instruction for schools, the latter representing a graded system of moral and religious instruction for the home and school.

SNEEHATTEN, snâ'hât-tên ('snow-cap'), Norway, the highest point of the Dovrefjeld, situated 80 miles southwest of Trondhjem. It is a snow-capped peak 7,566 feet in altitude.

SNEEZE-WEED, any one of the composite genus *Helenium*, as *H. autumnale*, a tall, rank-growing sunflower-like plant. It has a few long-rayed yellow heads, with protruding discs appearing in autumn, and is occasionally cultivated, although it is very coarse, with square, winged stems and alternate large punctate entire or dentate leaves. These and the flowers are bitter, acrid and pungent, and when dried and powdered cause violent sneezing, having been used in materia medica for this purpose. Sneezeweed is generally avoided by cattle, but animals unfamiliar with, or developing a taste for it, are often poisoned by it. The name is also sometimes applied to the sneeze-wort (q.v.).

SNEEZE-WOOD, a valuable wood, also called nieshout, yielded by the large South African tree *Pteroxylon utile* of the order *Sapindaceæ*, and brought to market in logs sometimes 80 feet long and four feet in diameter. It is very difficult to work on account of its great hardness, and the dust arising causes much sneezing (whence the name), but it is handsome, with a yellowish grain resembling

sandalwood, durable and avoided by white ants and shipworms.

SNEEZE-WORT, a composite herb (*Achillea ptarmica*) with larger and fewer white flowers than has the common yarrow of the same genus and finely serrate linear leaves, which, when dried and pulverized, are said to provoke sneezing. It is a European plant introduced into America.

SNEEZING. See NOSE AND THROAT, DISEASE OF.

SNELL, Henry Bayley, American artist: b. Richmond, England, 29 Sept. 1858. He studied at the Art Students' League, New York, and specializes in the painting of landscapes. He was awarded the gold medal of the Philadelphia Art Club in 1896 and was elected to the National Academy in 1906. Among his landscapes are 'Citadel at Quebec' (Albright Gallery, Buffalo); 'Nightfall' (Art Association, Indianapolis); 'Lake Como' (Metropolitan Museum, New York); 'Low Tide' (1907); 'The Harbor Light' (1913).

SNELLING, Fort, a small town and military post on the right bank of the Mississippi River, in Hennepin County, Minn. The fort was established in 1819 and is situated just above the mouth of the Minnesota River and about six miles southwest of Saint Paul. It is on the Chicago, Milwaukee and Saint Paul Railroad. Fort Snelling is shown in Humphrey and Abbott's war map of the 'Basin of the Mississippi,' etc., prepared for the War Department of the United States government in 1861.

SNICKER'S FERRY AND BERRY'S FERRY, Engagements at, American Civil War. General Early withdrew from the front of Washington on the night of 12 July 1864, recrossed the Potomac at White's Ford on the morning of the 14th, rested that day and the next at Leesburg, and on the 16th marched through Snicker's Gap. On the morning of the 17th he crossed the Shenandoah at Snicker's Ferry and took position near Berryville, Breckinridge's command of two divisions covering Snicker's Ferry and the river above and below, and Rodes' and Ramseur's divisions, the roads to Harper's Ferry. On the 16th General Crook, commanding three small divisions of Union infantry and one of cavalry, had run into Early's rear, near Purcellville, capturing 50 prisoners and 80 wagons. Under orders of General Wright, commanding the forces pursuing Early, Crook, on the 17th, sent Duffié's division of cavalry and Mulligan's brigade of infantry to Snicker's Gap, which was seized, but upon approaching the Ferry Early's well-posted artillery checked the column. On the 18th the remainder of Crook's command was pushed through the Gap and Duffié's cavalry was ordered through Ashby's Gap to attack Early's train in flank, it being the impression that Early was retreating up the valley. About 2 P.M. Crook directed Colonel Thoburn, with the two brigades of his own division and one of Duval's, to cross the Shenandoah at a ford a mile or more below Snicker's and, moving up, uncover it. Here a picket of about 100 men was encountered, which opened fire, but Thoburn's leading brigade dashed across the stream and captured 15 prisoners, from whom it was learned

that Early, with two divisions, was very near, and Thoburn was ordered not to advance, but to await the arrival of the Sixth corps. He had crossed his whole command and formed a defensive line; beyond his right was a force of 1,000 dismounted cavalry of various regiments, under Lieutenant-Colonel Young, Fourth Pennsylvania Cavalry. It was less than an hour after making these dispositions that Breckinridge, with the divisions of Gordon and Echols, advanced against his left and centre, and Rodes' division fell upon his right. The dismounted cavalry broke under Rodes' fire and, despite Young's effort to rally it, retreated across the river, carrying some of the infantry with it. Rodes pressed on, Thoburn changed front to meet him, but his right was forced back and driven across the stream. The left of the line repulsed two or three determined attacks and, under orders, withdrew across the river. The dead and wounded were left on the field. The Union loss was 65 killed, 301 wounded and 56 missing. The Confederate loss was about 300. Duffié, who marched for Ashby's Gap with 2,000 men and artillery, camped near Upperville on the night of the 18th, and next morning drove some cavalry through Ashby's Gap, and with one brigade crossed the Shenandoah at Berry's Ferry, where he was met by Imboden's and McCausland's brigades of cavalry, with two guns, and driven back. Artillery-fire was continued by both sides, and at 5 P.M. another effort was made to cross the river. One regiment charged across and up to the Confederate guns, but was quickly driven back with great loss. At night Duffié fell back to Ashby's Gap. His loss was 56 killed and wounded and 68 missing. The Confederate loss was not over 50. Wright remained at Snicker's Gap on the 19th, and that night Early, hearing that General Averell was moving from Martinsburg to Winchester, thus threatening his rear, retreated toward Strasburg. Wright advanced to Berryville on the 20th. Consult 'Official Records' (Vol. XXXVII); Pond, 'The Shenandoah Valley in 1864'; Early, 'The Last Year of the War for Independence.'

E. A. CARMAN.

SNIDER RIFLE, The. See SMALL ARMS.

SNIPE, certain limicoline birds of the family *Scolopacidae*. As explained in the article Sandpiper (q.v.) the names snipe and sandpiper are, to a large extent, used interchangeably, many of the species, more properly designated as sandpipers, having also one or more local names of which snipe forms a part. Besides the woodcock (q.v.), which is closely related, four species properly known as snipes occur in North America. All of these, together with numerous species inhabiting other parts of the world, have the bill very long, much exceeding the head, grooved for its entire length, somewhat flexible, flattened and expanded at the end and there richly provided with nerves and sense-organs. Because of these peculiarities these birds are enabled to employ the bill at once as a delicate, sensitive probe for exploring the mud deeply, and as a forceps for extracting worms and similar articles of diet which they there detect. The slit of the mouth is almost totally confined to the bill; the nostrils are rather large and placed very far back, almost

above the eyes and not directly in front of them as in most birds. The typical snipes belong to the genus *Gallinago*. Besides exhibiting the characters just enumerated in a high degree of development, this genus has the toes entirely without webbing, the tarsi short, less than the middle toe, the body full and plump, the wings short and rounded, the tail feathers numerous, variable in the different species and cross-barred. There is no noticeable difference in the plumage with season or sex. About 20 species are known, the majority from Eurasia and the others scattered. The only properly North American species is the well-known and favorite Wilson's snipe (*Gallinago delicata*), also known as the snipe, jack-snipe, American snipe and, through mistaken identity, as the English snipe. Its length varies from 10 to 11½ inches, the smaller birds being females, and its color a mottled mixture of various browns, black and white, giving a dark effect above, white below. There are 16 tail quills. Like most species of the family, it breeds northward, from the extreme northern United States to beyond the Arctic Circle. Within the United States it is widely distributed, during the spring migrating from March to May, and more abundantly in the fall from September to November. It frequents open marshes, both fresh and salt, and is consequently chiefly an inland bird, and is plentiful in the central West. In its southward journey it reaches the West Indies and South America, but seems less sensitive to cold than many of its relatives; and individuals sometimes haunt the vicinity of open springs during the prevalence of severe frosts both in the late fall and early spring. Unlike the bay birds the snipe is mostly solitary and never forms large flocks. Night is its chief season of activity, when it flies and migrates and to a great extent feeds. The soft ground in its haunts is probed in all directions for worms, insects, larvæ and similar creatures which, with snails and slugs, are consumed in great quantities. When flushed it utters a loud, rather harsh note and flies rapidly and very irregularly for 20 or 30 yards before setting a direct course. During the mating and nesting season these birds are much about by day and are said to perform remarkable aerial evolutions, often dropping swiftly from a height with a peculiar drumming sound caused by the air rushing through the wings. The nest is a mere depression in the ground lined by a few grasses or leaves, usually in the shelter of a tussock or bush in a bog. The eggs are four and of the pyriform shape usual in the family and grayish-olive tinged with brown and blotched with browns.

The snipe is justly a favorite game-bird and presents qualities which fully test the skill of the sportsman. Its habits and haunts are so easily affected by weather and other conditions that an intimate knowledge of its peculiarities are necessary first to find and then to approach the snipe. On windy, stormy days these birds are extremely wild and their senses are so keen that an unskilled gunner will see only their jerky flight in the distance. On such occasions leave the dog at home and approach the birds from the windward side with a strong-shooting gun. As they always rise toward the wind some good shots may be afforded before the birds get well started. On warm, murky days they lie close and a well-trained setter or spaniel is

necessary to flush them, especially if they be scarce. It is, of course, necessary to work against the wind, but when the dog marks, the gunner will do well to work to windward in order to get a quartering shot when the bird rises. The erratic flight of this bird in starting is very disconcerting to a novice and the best plan is to wait until it has steadied before shooting. As a table bird the snipe stands on a level with any.

Of the genus *Macrorhamphus*, in which the toes are slightly webbed, the legs more largely naked than in *Gallinago*, the wings longer and more pointed, and the summer and winter plumages different, we have two species, *M. griseus*, the eastern dowitcher, and *M. scolopaceus*, the western or long-billed dowitcher. The former is known in the summer plumage as the red-breasted, the latter as the red-bellied snipe, which, with the differences in the bill and the generic characters, sufficiently distinguishes them. Their habits are similar and their breeding habits are essentially those of Wilson's snipe. Within the United States they frequent the sea-coasts, flying in dense but not large flocks and associating with various sandpipers and yellow-legs. Their most distinctive traits are their confiding nature, proficiency as swimmers, swift flight and compact flocking. To the first and last of these is due their destruction in great numbers by bay-bird gunners, with whom they are great favorites.

Among European species of snipes may be mentioned the common or English snipe (*G. gallinago*), scarcely distinguishable from Wilson's snipe, except that it has only 14 tail feathers, and the great or solitary snipe (*G. major*), both of which have appeared as stragglers in North America.

Bibliography.—Baird, Brewer and Ridgway, 'Water Birds of North America' (Vol. I, Boston 1884); Bonhote, J. L., 'Birds of Britain' (London 1907); Elliot, 'North American Shore Birds' (New York 1895); Leffingwell, 'Shooting on Upland Marsh and Stream' (New York 1887); Rich, W. H., 'Feathered Game of the Northeast' (New York 1907); Sanford, 'Water Fowl Family' (New York 1903).

SNIFE-EEL, a small, slender, scaleless, translucent fish of the deep seas, with jaws prolonged into a slender bill, like a snipe's, the upper mandible somewhat recurved. There are many species, which form the family *Nemichthidae*, closely related to typical eels, but little is known of their habits.

SNIFE-FISH, a small fish (*Centriscolopax*) of the Mediterranean and neighboring waters, whose snout is prolonged into a tube suggesting a snipe's bill.

SNOQUALMIE RIVER in King County, Washington, drains a part of the west slope of Cascade Mountains east of Seattle and empties into Puget Sound. The falls, with sheer drop of 300 feet, are 25 miles east of Seattle, and are a resort famous for beauty of scenery. The water is largely utilized for power which furnishes electricity for Tacoma and Seattle. The estimated water power of the stream is 100,000 horse power.

SNORING, the act of breathing with a peculiar rough noise in sleep. This noisy mode of respiration is produced by deep inspirations

and expirations through the nose and open mouth, the noise being caused by the vibrations of the soft palate and uvula. The remedy is to tie a bandage under the jaw and over the head, so as to keep the mouth closed. An examination should be made of the nasal passages, which with snorers are usually clogged.

SNORRI STURLASON, *snor're stoor'lason*, Icelandic poet and historian: b. Hvamnn, 1178; d. 22 Sept. 1241. Tracing his descent from the kings of Norway, he early turned his attention to the history of their doings, and made a collection of sagas entitled the *Heimskringla*, or the Ring of the World, in which are interspersed songs from prehistoric times and also a number of poems by the skalds of the kings, whose lives are told by Snorri. It contains a record of the Norwegian kings from the earliest time to the death of Magnus Erlingsson (1177), and was first printed in 1697. It has been translated into several languages. Snorri became chief judge of Iceland, but his ambitious and intriguing character led to his assassination.

SNOUT-BEETLE, any weevil of the family *Curculionidae*, many of which are pests to growing plants or to stored grain, etc. One of the worst in the United States is the imbricated snout-beetle (*Epicærus imbricatus*) which is widespread and attacks garden vegetables and fruits of all sorts, sucking their juices.

SNOW, Francis Huntington, American naturalist: b. Fitchburg, Mass., 29 June 1840; d. 20 Sept. 1908. He was graduated from Williams College in 1862 and from Andover Theological Seminary in 1866, at which time he was called to the University of Kansas, then established, as professor of mathematics and natural history. In 1886 Snow Hall of Natural History was established in his honor, and in 1890 he was made chancellor of the university and professor of entomology. He was well known in the field of ornithology and meteorology, but especially as the discoverer of a fungus destructive to the chinch bug.

SNOW, Lorenzo, Mormon apostle: b. Mantua, Ohio, 3 April 1814; d. Salt Lake City, Utah, 10 Oct. 1901. He studied at Oberlin College, but was converted to Mormonism through the preaching of Joseph Smith in 1836, and became a Mormon elder and missionary of the Church of the Latter Day Saints. In 1849 he was proclaimed one of the Twelve Apostles of the Mormon faith, and during the periods between the migrations of his people was identified with its attempts at public education. He was the founder of Brigham City, Utah, whose industrial system he organized on the co-operative plan. In 1898 he was elected president of the Mormon Church. He translated the Book of Mormon into Italian, and was the author of 'The Only Way to be Saved' (1851); 'The Voice of Joseph'; and other Mormon books.

SNOW is the water in solution in the atmosphere crystallized into geometrical forms, or congealed by cold into granules or irregular particles. Snow forms usually within the clouds at various heights in the atmosphere, according to the latitude, degree of cold prevailing at a given locality, altitude of clouds, etc. It is produced in great quantity in all latitudes, though it rarely reaches the earth in the tropics

(except on high mountain tops), because the heat of the lower air melts it and converts it into rain. Over the circumpolar region perpetual snow covers the earth to the depth of many feet, and on the highland areas it accumulates to so great a depth that the pressure of the superincumbent mass above causes a gradual metamorphism in the character of the mass to take place, by which it is converted into glacial ice. Below 80° of latitude for each hemisphere (the general limit of perpetual snow) snow occurs in general in ever decreasing quantities as the equator is approached, until at 30° it is rarely seen at sea level. Over the northern portion of the temperate zones, and extending equatorward from 80° to about 45°, snow commonly covers the ground continuously during the winter months, and serves a most useful purpose in the economy of nature, in protecting vegetation and the earth's surface from the intense cold of winter. Owing to many causes, both meteorological and topographical, the amount of snowfall varies greatly at different localities, even as regards those situated upon the same parallels of latitude. Upon the tops of high mountains, whether these be situated within the frigid, temperate or tropical zones, snow falls intermittently throughout each year, and above a certain height upon them, called the snow-line, remains permanently, covering the summits. Owing to local causes, and to varying meteorological and other conditions, the snow-line upon mountains varies considerably in height, even as regards mountains situated upon the same parallels of latitude. In general it approximates 1,000 feet at 70°, 5,100 at 60°, 6,800 at 50°, 10,200 at 40°, 13,500 at 30°, 15,000 at 20° and 10°, and 16,000 or 17,000 feet at the equator.

Two distinct varieties of snow occur,—the crystalline and the granular. The latter sometimes occurs as a distinct formation by itself, but more frequently as an accretion deposited by mist, or by clouds laden with minute raindrops, upon the crystalline varieties while these are passing through them on their earthward journey. Those particles wholly of a crystalline character are transparent like glass, vary in size from three-quarters to one-fiftieth of an inch in greater diameter, and fall to earth singly, or bunched together into flakes, according as to whether the temperature and humidity are low or high. In general their size decreases in a certain ratio, with a decrease in the temperature of the air, and vice versa. The majority exhibit a tendency to divide into six, due to the fact that snow crystals belong to the hexagonal system of crystallization.

The majority of snow crystals assume forms which, by virtue of outline structure or general characteristics, may be grouped into two principal classes,—the columnar and the tabular. Those comprising the former class are all such as appear in the form of hexagonal columns, long, slender, needle-shaped crystals, or columns tapering at one end. The tabular snow-crystals develop upon an extremely thin tabular plane, whether they possess open or solid structure, or both combined. These two principal types often combine, tabular crystals forming upon one or both ends of the columnar crystals, on a plane perpendicular

FORMS OF SNOW CRYSTALS

FORMS OF SNOW CRYSTALS

to their main axis, and so form compound crystals.

Crystalline growths sometimes take place from minute granular snow, the latter forming the nuclei, from which crystalline additions project or ramify in many planes. During extreme cold, or when snowfalls emanate wholly from high cirro-stratus clouds, minute sub-crystalline varieties often predominate, exhibiting an imperfect or segmentary semblance to tabular or columnar forms.

The various types of snow crystals do not occur with equal frequency, or form an equal bulk of the total snowfall. The tabular crystals, and especially those of an open, branchy structure, appear the most frequently, and the others in the following order: tabular crystals possessing solid nuclei; granular snow, minute irregular sub-crystalline varieties, solid tabular hexagons, columnar crystals, compound crystals.

The columnar crystals vary much less than do the tabular ones; such variations as occur being chiefly those relating to their dimensions, rather than their structure or aspect. The compound crystals exhibit a much greater variety of form and structure. The connecting bar varies greatly in both length and thickness in the same and in different snowfalls. The tabular crystals attached to one or both ends of the columnar bar also vary greatly at different times, both as regards size, outline and structure, and these variations often apply to the tabular crystals attached to the same bar. Commonly, whenever the connecting bar is extremely short, one of the tabular crystals attached to its ends will greatly exceed the other in size, and as a result the compound crystal (resembling a cuff-button in shape) is practically converted, for purposes of descent, into a tiny parachute, the minor tabular crystal assuming the role of parachutist; and in this order the crystals fall through the air and alight upon the earth.

The most important division into which snow-crystals are divided is the tabular class, and those grouped under this head occur the most frequently, exhibit the greatest beauty and diversity of form, and form by far the larger part of the total snowfall. The variations of outline, structure, internal ornamentation, etc., of the individual crystals of this class, both in the same and in different snowfalls, are all but infinite. No written description can adequately portray the wondrous beauty, complexity and perfect symmetry of many of them; it far transcends that of the crystals of any other mineral species. They occur in three principal subdivisions, and the frequency of the occurrence of each is in the following order:

(1) Those of a wholly open structure (branchy); (2) those possessing nuclei of a close structure surrounded by growths of an open nature; (3) those whose structure is wholly close (solid). Owing to various unfavorable conditions, as violent winds and the collisions and fractures due to these, development proceeding while they are in motion (as in falling) or while they are in close juxtaposition, and to other unknown causes, the majority of the crystals of snow fail to attain perfect symmetry in all their parts. Commonly the nuclei outline a minute star, a hexagon, or

a circle. The number of snow-storms depositing large numbers of beautiful and symmetrical crystals at a given locality, in the northern part of the United States, during any one winter, does not usually exceed 16, and may not exceed eight. The great majority of the more perfect and beautiful crystals usually emanate from the clouds of the western, southwestern or north-western segments of great storms. In general, similar types of crystals occur in most storms, within corresponding segments of each, due to some law of general distribution. Each cloud-stratum, the high, the low and the intermediate, and the temperatures, air-pressures, etc., corresponding with each, seem to favor the formation of a certain type of crystal; the low clouds give large branching crystals; the high clouds, small, compact ones; the intermediate clouds, medium-sized crystals, in form a composite of the low and high types.

The feature of chief interest and importance concerning the internal structure of the crystals is the occurrence therein of minute inclusions of air and air-tubes. These appear by transmitted light as dark lines or shadings, etc., because of the absorption, interference, or refraction of the rays of light that strike or pass through them. The beautiful and usually symmetrical arrangement of these air-tubes and compartments impart to this type of crystal its principal charm. These air-inclusions are of great interest, because of the great number of distinct and varied inclusions that often appear within the same and within different individual crystals, and also because it may be assumed that they were not formed in regular progressive order, but in intermittent order from the nuclei outward, while each new and distinct outgrowth was being added to and arranged upon and around the growing crystals; and hence they outline the boundaries of each of the many pre-existing shapes the crystals successively assumed in cloudland.

Hundreds of drawings of this variety of snow crystal have been made by various observers, among them Dr. Scoresby and James Glaisher of England, Prof. S. Squinahal of Italy, and Mrs. F. E. Chickering of Portland, Maine. Many of these have been published in textbooks and other publications. More recently the aid of photography has been invoked in securing and perpetuating the likenesses of these beautiful but fleeting forms. During the winter of 1902-03 Dr. Neuhaus of Berlin secured microphotographs of them, and about the same time Herr Sigson of Russia and Dr. Nordenskiöld of Stockholm also secured microphotographs. Many of these were published in the *Meteorologische Zeitschrift* for 1894, in a paper issued by the Geological Society of Stockholm, and also in a book by Dr. G. Hellman, entitled 'Schneekrystalle.' The pioneer in this work, however, seems to have been W. A. Bentley of Jericho, Vt., who began the photographing of them during the winter of 1885. By the spring of 1904 the microphotographs secured by him numbered over 1,100, no two alike. Many of these were published in a publication issued by the United States Weather Bureau, entitled 'Studies Among the Snow Crystals, Winter of 1902.' These photographic studies, in connection with the meteorological ones made simultaneously, have greatly

increased our knowledge of these most interesting crystal forms.

The manner in which the snow crystals form is this: They crystallize in a liquid (the air) of small density, which is often in a state of agitation where the crystals are forming, and whose degree of density, humidity, etc., is ever changing; and usually among a multitude of uncongealed or uncrystallized particles of vapor, called cloud. The commonly accepted theory is that these visible cloud-particles unite to form the true snow-crystals. This is doubtless true, in so far as the granular varieties are concerned, but the true crystalline varieties probably form direct from the invisible water-molecules floating in the air, before these unite to form the vastly larger cloud-particles. It is possible that the cloud-particles are essentially the dross, residue, or excess of moisture left over during the process of crystal-building. A portion, at least, of this residue or excess of moisture ascends, and is congealed in the upper air, into the semblance of minute snow-crystals; appearing in the form of the cirrus cloud above, and often around all storms of great duration or magnitude. Many occurrences are on record of snowfalls occurring from skies clear or nearly free from visible clouds, and this lends additional weight to this theory. So very light are many of the snow-crystals, especially while they are in a nuclear or uncompleted state, and so strong are the expanding, uprushing air-currents within many portions of great storms, that it must be assumed that many crystals are wafted upward, perhaps repeatedly, and acquire growths at greater altitudes than that wherein the nuclei originated, before they attain sufficient weight to fall to earth. Doubtless the multitudinous changes of form and structure that many of the crystals undergo within the clouds during growth are due to these many vertical and horizontal flights within the clouds and to the great and ever-changing variety of meteorological and other conditions prevailing therein, each of which impresses its especial condition upon them.

The production and deposition of the snow, occurring, as it does, over so large a portion of the earth's surface, are phenomena of great magnitude and importance. Snow not only changes the whole aspect of nature but it also serves many useful purposes. It conserves the heat of the earth and protects vegetation from the intense cold of winter and even in northern regions, where deep snows occur, it is not considered a serious impediment to travel or commerce. A track once made, the compacted snow affords an excellent roadbed, over which heavy loads of merchandize can be easily and quickly transported on sleighs. But while in the abstract its manifestations are beneficent, in the concrete, some of them are otherwise. Much damage often results from the great inundations caused by the sudden melting of deep snow over large areas, and its sudden accumulation to great depths often causes a temporary blockade of railroad service and travel in general. A large fall of damp snow or sleet sometimes accumulates so heavily upon telegraph and telephone poles and wires and upon the limbs and smaller trees of the forests, that they break under the great weight. Snow-slides from the steep sides of mountains sometimes

occur and bury and destroy whole villages. Altogether the snow fills a most important place in nature's plan. Not only is it beautiful in itself, composed of the most graceful crystal forms that occur in nature, but it plays an important part in beautifying earth and sky, forest and mountain.

The measurement of snowfall is often a matter of considerable difficulty, on account of the drifting caused by the winds. Various types of gauges are used to collect the snowfall over a given area and measure the amount of water formed by its melting. Hollow tubes are used to gather and weigh fallen snow so that the total amount of snow over a given area may be estimated. Stakes planted in the ground are also employed for this purpose.

W. A. BENTLEY,

Author of 'Snow and Snow Crystals.'

SNOW-BALL. See GUELDER ROSE.

SNOW-BERRY, a name applied to several white-fruited plants, among them the rubiaceous *Chiococca alba* of tropical America, a climbing plant with yellow flowers and white berries. It has medicinal properties, and the root, known as calunca-root, was used as a diuretic. The cultivated snow-berry (*Symphoricarpos albus*) is a small, smooth, much branched shrub of the honeysuckle family, common in North America. It has opposite oval leaves, and inconspicuous rose-colored flowers in racemes, often leafy. While of somewhat sprawling habit, snow-berries are valuable because of their power of increasing rapidly by suckers, and for their ornamental white, pulpy berries, borne in such abundance as to bend down the slender branches, and retained far into the winter. The creeping snow-berry is another northern plant (*Chiogenes hispidula*), an evergreen trailing shrub, found in sphagnum bogs and mountainous evergreen woods. It is pubescent, with alternate two-ranked ovate leaves, and axillary, small, white flowers, succeeded by somewhat dry white berries. The whole plant has the aromatic taste of sweet birch.

SNOW-BOUND. 'Snow-Bound; a Winter Idyl' (1866) was written by Whittier immediately after the close of the Civil War. The lifting of a great pressure of anxiety left him free to be idyllic, which he could be all the more movingly because of the recent deaths of his mother and sister, deeply-regretted links with the past, which he perpetuates. Few poems unite with so much tenderness, so much accuracy. 'Snow-Bound' can be called nothing less than the classic picture and epitome of rural New England during its golden age. The sturdy, simple family shut in by the December snow storm includes most of the types native to that region: the "prompt, decisive" father who knows Canada and the sea, and by his adventurous tales brings half of New England to the winter fireside; the busy mother, full of memories of her own girlhood, of legends of Indian raids, and still more remote and venerable, of Quaker antiquities as recounted in "painful Sewel's ancient tome"; the uncle, "innocent of books," who knows the lore of weather and cloud and bird and muskrat in a way which points forward to that village naturalist of genius, Thoreau; the maiden aunt, sweet, devoted, cherishing the "virgin fancies

of her heart"; the schoolmaster, a young Dartmouth student who, adaptable and at ease, brings into this plain neighborhood the love of learning and truth; and finally the guest, the lovely and eccentric woman marked by the touch of wildness, nearly madness, that now and then flashes from beneath the surface of New England sobriety. These Whittier describes, and their occupations during the week of close embargo, with the fidelity of affection; while even above his truthfulness to outer fact rises his truthfulness to the deeper spirit of New England, its homeliness, its stability, its aspirations, and its inviolable confidence in high and good things. The style of the poem is limpid and flexible, now Flemish in its unadorned detail, and now radiant with mystical fervor.

CARL VANDOREN.

SNOW-BUNTING, or SNOW-FLAKE, a large bunting (*Plectrophenax nivalis*), common in the northern regions of both hemispheres, and visiting the United States and central Europe in flocks during the winter. They haunt the open, treeless wilds, and place their nests on the ground or in the crevice of a rock throughout northern regions. Their long hind claws serve to distinguish them from the true buntings, giving them a certain similarity to the larks, which they also resemble in running swiftly and in never perching (see LONG-SPURS). In winter the plumage of the male is almost or quite pure white. The summer dress exhibits a tawny brown hue, spotted with white, the back darker. The average length is about seven inches. The song is sweet, but faint. The Laplanders account the flesh of these birds a great delicacy; and in Greenland they are caught and dried in great numbers. They subsist largely on seeds.

SNOW-DROP, any one of the 50 or more cultivated varieties of the genus *Galanthus* (*Amaryllidaceæ*), the most common being the European snow-drop (*G. nivalis*), famous for its midwinter blooming. They are small, low plants, with bulbous roots, narrow leaves and nodding white flowers, touched with green. The corollas are somewhat bell-shaped, having six segments, the three outer concave and spreading, and the others straight and shorter. *Galanthus elwesii* is one of the largest flowered varieties. Although usually very early spring bloomers, giving the bees their first supplies of honey; some varieties appear in the autumn, and were, for a while, rare plants.

SNOW-FLAKE, any one of the species of *Leucojum*, a genus of the *Amaryllidaceæ*, resembling the snow-drops, but larger and having the six segments of the perianth equal. They are graceful, nodding flowers, pure white, except where touched with green at the tips of the petals, and are low and bulbous, with narrow leaves. *L. vernum* blooms soon after the snow-drops and crocuses, while *L. æstivum*, the summer snow-flake, a species of continental Europe, blooms still later, and has several flowers on a stalk. Propagation is by offsets, and these are best removed when the leaves are dry.

SNOW-GOOSE, an Arctic goose (*Chen hyperboreus*). See GEESE.

SNOW LEOPARD, or OUNCE, a large cat (*Felis uncia*) of the high mountains and plateaus of central Asia, where it is often found in snowy forests near the limit of timber growth, and rarely descends below 9,000 feet. It feeds on wild and domestic sheep, goats and dogs, but is not feared by the men of the region. Mivart points out its special interest as a large feline animal adapted to live in a cold climate, and says: "It is clothed in a dense long fur, which even forms a short mane. It is four to four and one-half feet long, without the tail, which measures a yard. The fur is of a pale yellowish gray, with small irregular dark spots on the head, cheeks, back of neck and limbs, and with dark rings on the back and sides. It is whitish beneath, with some large dark spots about the middle of the abdomen. The long bushy tail is surrounded by incomplete black bands." Its fur is one of the most handsome and valuable yielded by the cat tribe.

SNOW LINE, that line above which there is perpetual snow. In equatorial regions it usually lies at a great elevation, but in polar regions it is very near sea-level. Glaciers form in most regions above snow line. See GLACIERS.

SNOW-OWL, a large owl (*Nyctea nyctea*), a native of the north of Europe, Asia and America. In old birds the plumage is occasionally pure white, but in younger and most adult birds each feather is tipped with dark brown or black. The length of the adult male is about 20 inches, that of the female four or five inches more. This is one of the largest of the owls, and is at once distinguishable from the great horned owl, the only other species of equal size which occurs commonly in the United States, by the absence of ear-tufts. It breeds altogether north of the United States, and while it is quite capable of enduring the cold of Arctic winters, a larger or smaller number migrate southward, but most irregularly, every winter. During some winters it is very rare, and sometimes very common in the Middle States, and it may straggle quite to the Gulf Coast. The five to eight large white elliptical eggs are laid in a nest built on the ground in a rocky spot. This is one of the most diurnal of the owls and frequently hunts by day, its prey being hares, grouse, ptarmigan and similar mammals and birds, as well as rats and mice. See OWL.

SNOW PLOW, a machine or implement used to clear snow from roads, tracks and pathways. The simplest form for common highways consists of boards framed together so as to form a sharp angle, like the letter A in front and spreading out behind to a greater or less width. Being drawn along with the apex in front, the snow is thrown off the boards to the side of the road or path, and thus a free passage is opened for traffic. The snow plow in common use on urban street railways consists, roughly, of a heavy car on high trucks; underneath the floor of the car and before or behind each pair of wheels are huge rotary brushes, of cane, wood-fibre, or some stiff material. These brushes are set obliquely across the track, at right angles to each other, and are about two feet or a yard in diameter. When the car is in motion power is supplied (from the same source

as the motive power), and the brushes rotating swiftly sweep the track clear of the snow, which is thrown to either side. This is further removed by means of side drags, or boards obliquely attached to the car and set edge up, on either side, the point of the angle which they make with the body of the car being directed to the front. Snow plows are in common use on the Western and Northern railroads in the United States and Canada. They are of many different patterns, the machinery for such purpose being improved and revised every year. They are constructed more or less on the same principle, which comprises pairs of rotary blades obliquely set in a drum casing open at the front end, and driven by horizontal shafts, the other ends of which are connected with machinery in the body of the car, from which the driving power is supplied. Such an engine is coupled to the locomotive, from which it draws the steam necessary for the operation of the plow through connecting pipes. Another locomotive is hitched behind to supply the moving power, then comes the train of cars, and, in many cases, behind these another locomotive to help in the pushing. By means of such contrivances the railroads have been enabled to operate through severe snowstorms, cutting through drifts which completely bury their tracks and which before the invention of the snow plow necessitated complete suspension of traffic. Snow plows are now in use on practically all railways in cold climates.

SNOWBIRD, a North American finch of the genus *Junco*, in which the plumage is not streaked, and the two marginal feathers of the tail are white. They are northern birds, the eastern ones breeding south of the Great Lakes only on the tops of mountains, and the several western species inhabiting Canada or the peaks of the Rocky and Pacific Coast mountains, making their nests on the ground. They appear in the middle districts about the time of the first snowfall, and remain as familiar winter residents. The common *Junco hyemalis* of the United States, east of the Missouri, is six and one-quarter inches long; grayish or dark ashy black all over the head, neck and upper parts, with the breast, belly and under tail coverts, and the first and second external tail feathers white. Western species, such as the Oregon snowbird, exhibit a greater or less amount of chestnut tints in the plumage. They utter sharp chirping notes in winter, but sing prettily during the breeding season. The name is also applied to the brambling and fieldfare or any small bird seen during snowfalls.

SNOWDEN, Ethel, English non-militant woman suffrage leader: b. 19th century. She was married to Philip Snowden (q.v.) in 1905, and became known as one of the more conservative leaders in the movement for woman suffrage. She attended the Woman's Peace Conference at San Francisco in 1915.

SNOWDEN, James Ross, American numismatist and government official: b. Chester, Pa., 1810; d. Hulmeville, Pa., 21 March 1878. He was educated at Dickinson College, studied law and engaged in practice at Franklin, Pa. He was speaker of the State legislature in 1842-44; State treasurer in 1845-47; treasurer of the United States mint in 1847-50, and its

director in 1853-61. He wrote extensively on numismatics and besides many official reports and addresses was author of 'Descriptions of Coin in the United States Mint' (1860); 'The Mint at Philadelphia' (1861); 'The Coins of the Bible and Its Money Terms' (1864), etc.

SNOWDEN, Philip, English Socialist and labor leader: b. Kneighley, Yorkshire, 1864. He was employed in the Civil Service in 1886-93, afterward engaging in journalism and lecturing. He was elected to the House of Commons in 1906. He was chairman of the Independent Labor Party in 1903-06; was a member of the Royal Commissions on Canals and Waterways and on the Civil Service; and a member of the Central Control Board (liquor traffic). Author of 'Socialism and Syndicalism' (1915).

SNOWDON, snō'don, Wales, a mountain-range in the northern county of Carnarvonshire, extending from the neighborhood of Cardigan Bay to that of Conway. It is crowned by five ridges, of which Moel-y-Wyddfa is the highest point in Wales (3,560 feet). The range is steep on the west, but more gradual on the east. It is penetrated by many valleys and streams, the most important of which are the Cwmglas and Cwm-y-Llan. There are some beautiful lakes, which attract many visitors. Bettws-y-Cold is one of the centres of resort. An electric railway to the summit of Snowdon was completed in 1897.

SNOWSHOE, a framework loosely attached to the shoe or moccasin for giving support to the wearer in walking over soft snow, much used by the Northern Indians, the Canadians, Laplanders and other residents of countries where snow remains for long periods. It consists of a frame of bent wood, interlaced with a network of hide or sinews cut into strips. The portion where the ball of the foot would rest is more closely woven than the rest, and is strengthened by a piece of light, tough wood strapped across from side to side. The shape of the snowshoe is elliptical, being rounded in the front and drawn out to a long blunt neck at the back. Its size is usually three feet or more in length and a foot to a foot and a half in width. This large, flat surface furnishes a larger plane of resistance to the soft snow and by distributing the weight of the wearer over a larger surface than the foot does, does not break the brittle crust on the top of snow, which makes progress without snowshoes impossible. In use, the wearer may well encase his feet in moccasins and further protect them by wrappings or many pairs of stockings. This is necessary to prevent the foot from being chafed by the strap, into which the toe is passed. This strap is in the middle of the snowshoe, over the strap of wood, near the front; the heel of the foot is not attached to the snowshoe at all. When the heel is raised in walking, the snowshoe is not lifted, but remains flat on the ground, then, as the foot is lifted the toe elevates the forward part of the snowshoes and it is dragged along on the snow as the leg advances. Experts can walk on snowshoes with great rapidity, but there is a swinging outward motion that must be acquired before the novice can hope to make the shoes serviceable. When there is a light crust on the

snow snowshoes allow the hunter to overtake deer, moose and other hoofed animals, whose pointed feet piercing the crust sink through the snow and make rapid flight impossible. In Canada races on snowshoes have become a regular feature of the winter sports, and records show 100 yards covered in 10 seconds; one mile in from four and a quarter to five minutes; five miles in from 31 to 33 minutes. Snowshoes are frequently highly ornamented and among some of the Indians serve as love tokens. See SKI. Consult for records the reports of 'The Montreal Snowshoe Club.'

SNUFF, a powder manufactured from tobacco and used for chewing and for inhaling through the nose. For the manufacture of the finest grades of snuff only the choicest portions of fine leaf are used, but for the ordinary commercial brands the thick, stemmy portions, the mid-rib and scrap tobacco are employed. The making of snuff is one of the most intricate processes for which the tobacco leaf is used. The peculiar aroma and fragrance in snuff are obtained by a species of fermentation induced in the leaf by packing it, moist, in large quantities and subjecting the mass to a high temperature. Snuff is either moist or dry, the details in manufacture differing only in regard to the amount of moistening undergone. The moist snuffs are known as rappees, and the dry under various names, the varieties known as Irish, Scotch and sweet snuff being common. The manufacture of French rappee has been brought to a high degree of excellence by the French government which owns large factories. The tobacco is subjected to two processes of fermentation, whereby aroma and strength are acquired, and the nicotine and organic acids removed. The leaves and stalks, moistened with salt water (to prevent putrefaction), are pressed into cakes and sliced and left in open chambers for five or six months to ferment and develop aroma, the temperature at times reaching 140° F. After that time the tobacco is ground in mills out of contact with air, in order to preserve the aroma, and the powder, rapé sec, is after damping conducted to closed wooden chambers to undergo during 10 months the second fermentation, which imparts strength to the snuff. During this fermentation the temperature is kept at from 120° to 130° F. and the snuff is frequently repacked, to ensure uniformity. Finally the snuff is gathered from the fermenting rooms into one large chamber, where it matures for one month; it is then ready for stamping into casks. The machinery used in the French factory is almost wholly automatic. Snuff is very commonly adulterated in order to increase its bulk or pungency. During its manufacture various flavoring sauces and waters are used for dampening both the leaves and the rapé sec, and in this way the flavor of the finished snuff is effected. The processes of manufacture occupy about 18 to 20 months, and in this time, by the repeated fermentations, about two-thirds of the nicotine is destroyed, the acids (malic and citric) are destroyed and the acetic acids and bases evolved leave free ammonia in the snuff. This, with the slightly free nicotine and the aromatic pungents, are desired qualities. The Scotch and other dry snuffs are commonly slightly adulterated with quicklime, which gives the biting, desiccating effect

for which they are peculiar. Snuffs are scented with musk, essences of bergamot, lavender, attar of roses, tonquinbeans, cloves, orange flowers, jasmimes, etc.

The practice of snuff-taking was introduced into Europe from America during the 16th century, and during this and the following century became very general throughout the Continent and in England. Its use in England greatly increased under the reign of William and Anne, and in France under the various Louis. The practice, although almost entirely abandoned by the upper classes to-day, is more widely prevalent than is commonly thought. The consumption of the drug in the British Isles is said to amount to more than 900 tons annually. In the United States, where the consumption is about 9,500 tons a year, the chief users are foreign-born. The snuff used in this country is all of domestic manufacture, the small amount of French snuff imported not being worth considering.

The habit of taking snuff is said to be one of the pleasantest ways of using tobacco. The snuff, pinched up between the thumb and forefinger, is drawn into the nostrils by sharp, deep inhalations. In a few moments it produces a ticklish sensation, which frequently causes sneezing, and is highly gratifying to the user. The habit of "dipping snuff," at one time common among the poorer classes in the south Atlantic portions of the United States, consisted in holding in the mouth the well-chewed end of a dry twig, which had been dipped into powdered snuff. The habit is still prevalent in some sections.

Snuff-boxes, for retaining small quantities of the powder about the person, are of great variety of shape and material. When snuff-taking was one of the habits of society these boxes were often of much value and beauty of workmanship. Gold, silver and precious stones were employed in their manufacture and some of the boxes of crowned heads and of the popes are famous for their workmanship. The ordinary boxes used by the snuff-takers to-day are of horn, papier-maché or lacquered wood and are made largely in France and Germany.

SNYDERS, sni'dërs, Franz, Flemish painter: b. Antwerp, 1579; d. there, 19 Aug. 1657. He studied under Brueghel, the younger, and Hendrick van Balen. In 1602 he was elected master of the Guild of Saint Luke. In his early life he painted fruit and flowers. Rubens engaged him to paint still-life accessories in his pictures, and in turn Rubens often painted the figures for Snyder's canvases. His pictures are found in all the great galleries of Europe. His masterpiece, 'Two Lions Pursuing a Roebuck,' is on exhibition at Munich.

SOANE, sōn, Sir John, English architect: b. Whitchurch, near Reading, 10 Sept. 1753; d. London, 20 Jan. 1837. He was a mason's son, and was for a time an errand boy, but having gained some architectural knowledge, won first the silver medal (1772) and afterward the gold medal (1776) of the Royal Academy, the latter for a design of a triumphal arch. In 1788 he was appointed architect to the Bank of England, and in 1791 clerk of works to Saint James' Palace, the Parliament Houses and other public buildings. He was elected A.R.A. in 1795 and R.A. in 1802 and became professor of archi-

ture to the Royal Academy in 1806. He was knighted in 1831 and at his death bequeathed his collection of works of art and \$130,000 to the nation. The Soane Museum thus formed is housed at 13 Lincoln's Inn Fields, London, and contains antique sculptures, bronzes, gems, models of ancient buildings, a collection of pictures, etc. Consult 'Memoir' by Britton (1834). He published plans of 'Public and Private Buildings' (1828).

SOANE MUSEUM, The. See SOANE, SIR JOHN.

SOAP, a chemical combination of fats and alkali, used as a detergent. The cleansing properties of these compounds have been known for a very long time; the manufacture of soap upon a large scale dates only from about 1823, in which year Chevreul published his famous researches upon the animal fats. The natural fats — palmitin, stearin, olein, etc.—are acid ethers of glycerine. Glycerine is an alcohol containing three atoms of replaceable hydrogen, its formula is $C_3H_5 \left\{ \begin{array}{l} O_2 \\ H_2 \end{array} \right.$; in the fats these three hydrogen atoms are replaced by the radicles of various acids, chiefly of palmitic, stearic, margaric and oleic acid, and thus are obtained the glycerides of these fatty acids, or, as they are commonly called, the fats palmitin,

$C_{18}H_{35} \left\{ \begin{array}{l} O_2 \\ (C_{18}H_{35}O)_2 \end{array} \right. \text{ } O_2$. If these fats be heated with caustic alkalis they are decomposed, a union taking place between the particular acid, the radicle of which exists in the fat, and the alkali while glycerine is at the same time produced; thus with stearin and caustic potash the reaction may be formulated:

The salt of the fatty acid so produced (in this instance potassium stearate) is called a soap. Soaps, therefore, may generally be defined as the metallic salts of the higher fatty acids, and the process whereby these salts are produced from the natural fats is called saponification. Although this includes under the name soap all the metallic salts of the higher fatty acids, yet in common usage the name is limited to the sodium and potassium salts of these acids.

Soaps are also produced by treating certain oils with caustic alkalis; these oils are of the class known as fixed oils, so-called because they cannot be distilled without decomposing. Oils which may be distilled, as the essential oils and mineral oils, are not available for soap-making.

The essential parts of a soap then are (1) the alkaline metal and (2) the fatty acid which it contains; upon these two the quality of the soap depends. Speaking broadly, two kinds of soap are made for the market: hard soap and soft soap. In the former type, soda is used as the combining alkali; in the latter, potash.

Materials.—The oils and fats in economic use for the manufacture of soap may be divided for discussion into five groups or alliances: (1) coconut oil and palm-kernel oil; (2) olive oil, olive oil foods, cottonseed oil, peanut oil,

sunflower seed oil and corn oil; (3) tallow, greases and palm oil; (4) castor oil and linseed oil; (5) red oil and resin. The oils in the first group saponify very quickly at ordinary temperatures upon the addition of cold concentrated caustic soda. During the action great heat is evolved. A larger yield of firm soap is obtained from these oils than from any others. They are, however, rarely used alone, but are added to tallow and cottonseed oil, and this combination results in a superior grade of soap, better than can be made from either of the ingredients alone. Their glycerine content is higher than in any other group, amounting to 12 per cent. The second group is composed chiefly of glycerides of oleic acid. They yield a thin soap, very soluble in water, and make good toilet and textile soaps. The well-known green Castile soap, when pure, is made from olive oil. Their glycerine content is about 10 per cent. The third group are glycerides of (principally) stearin and palmitin, and yield a firm soap of good body, dissolving slowly in water; much improved by the addition of oils from the first and second groups. The oils of the fourth group saponify readily, yielding highly soluble soaps of a pale brownish color, useful in making transparent soaps. The acids of the fifth group combine directly with caustic soda. They are used only in combination with other groups.

In the last few years the process known as hydrogenation has made oils which had been unavailable for soaps a very important factor in the raw materials market, which had been seriously narrowed by the demand for all edible oils by the manufacturers of oleomargarine and "nut butter." By this process oleic acid is converted into stearic acid by passing a current of hydrogen gas through it in the presence of reduced nickel, while at the temperature of about 550° F. This process is applied chiefly to cheap fish oils—which lose their objectionable odor during the treatment.

Manufacture.—Soap is made generally by one of three processes: (1) that in which the glycerine of the fats is set free and separated out; (2) that in which the glycerine is set free, but not separated; (3) that in which there is direct saponification and no glycerine is produced. More than 90 per cent of the soap produced is made by the first plan, the by-product glycerine being very valuable. The oils and fats in predetermined proportions are measured into the "kettle," a large cylindrical tank which may be as much as 25 feet in diameter and 30 feet deep. This kettle has an open steam coil in the bottom to supply the heat. Part way up the side is an outlet pipe with a valve through which the crude soap is drawn into the crutcher after the saponification is complete. At the bottom of the kettle is another outlet through which is drawn the watery residue after the soap has been separated out. Following the charging of the kettle with fats a measured portion of a dilute lye made with caustic soda is run in and the steam turned on, and the contents of the kettle vigorously boiled. As the soda unites with the fat more lye is added at intervals, care being taken that at no time until the saponification is almost complete shall there be an excess of alkali. When the contents of the kettle appear clear and homogeneous, dry salt is shoveled in. As soap is but sparingly

soluble in brine the action of the salt is to separate the mass in the kettle into two layers, the upper one being of the separated soap and the lower one a mixture of brine, glycerine and excess lye. This step in the process is called "graining" because of the granular appearance of the soap. The amount of salt necessary depends upon the kind of oil and fat used as the raw material, some fats requiring much more than others. The salt is added in small instalments until the separation is complete. After standing several hours the lye is drawn off from the bottom of the kettle and clear water turned in. If the soap is to have an admixture of resin, it is added at this stage. A proportion of caustic soda is added to remove impurities, and the boiling is renewed, and the soap again becomes a clear mass. It is salted out a second time, and the process repeated, if it seems desirable, with the addition of lye only. The next step in the process is "fitting." Water is added by degrees and boiling continued until the soap gains the proper appearance, readily recognized by the experienced soap boiler. It is then allowed to settle, which if the batch is large may take four or five days, more or less, according to the raw materials used and the season of the year. The batch is then found to be in four distinct layers: (1) a crust of "fob" or soap froth; (2) the good soap, containing 63 or 64 per cent of fatty acids; (3) the "nigre" or weak, dark-colored soap, containing about 33 per cent of fatty acids; (4) watery lye. In making cheap soaps the second layer is run directly into the soap "frames"—casings in which it stands until cold and solid. For a finer grade it is run first into the "crutcher," a mixing machine, where it may be "filled" by adding sodium carbonate, sodium silicate, sodium borate, naphtha (up to 10 per cent), perfumes and coloring matter. After some hours of crutching it goes to the frames to solidify. Special cooling machines have recently come into use whereby the cooling process has been reduced from several days in the ordinary frames to two hours, or even less. The device consists in forcing the liquid soap into metal casings the sides of which are continually cooled by the passage of currents of cold water. By the turning of a screw the casings are released, and the blocks of soap readily removed. When hard enough the blocks are put through the "slabber," which divides them into slabs by forcing piano-wire cutters through the mass. They are then cut twice again, lengthwise and crosswise, into cakes which are placed on racks to dry. When they have dried out to the proper hardness they go to the presses, where each cake receives definite form and the imprint of the maker. Thence they go to the machine which wraps them preparatory to boxing for the market.

Toilet soaps are usually "milled," the process beginning with shaving or chipping of the blocks of soap as they come from the frames. These chips are allowed to dry hard, perfume and coloring matter are added and they are then run several times through a mill of rollers which transforms them into thin flakes while perfecting the thorough mixing of the ingredients begun in the crutcher. When the soap flakes are entirely homogeneous they go into a machine called the "plodder," a cylindrical or conical casing in which revolves a longitudinal

screw. The screw forces the soap forward under great pressure and it is finally exuded through a form plate in a continuous bar having the outline of the cake in which it is eventually sold. The bar is cut into sections of the proper size and these receive their final shape in a press.

The second process of soap-making, in which the glycerine is set free but not separated, is used in the manufacture of soft soaps. Large quantities of soft soap are used in the textile industry. They are made chiefly of linseed oil, corn oil, whale and fish oils and in the finer grades of olive oil. Special white soaps are made with cocoanut oil and some tallow. As previously noted the lye used in making soft soap is made from caustic potash. The lye is added by degrees as in making hard soap, and the boiling is done with a closed instead of open steam coil. The color of the finished soap depends largely upon the kind of oil used, but to a considerable extent upon the care taken in the making. Good soft soap contains about 43 per cent of fatty acids, 10 per cent of alkali and 47 per cent of water. In some grades a percentage of saponified resin is added, but this is highly objectionable in certain textile soaps, and the practice is, therefore, limited.

The third process, that in which the glycerine is not formed, is known also as the "cold process." The soap is not boiled, the oils and alkali being carefully proportioned to form complete neutralization. While this process was formerly restricted to cocoanut oil, it has proved workable with other oils and fats when the lye is made strong. It is required, however, that the fats be absolutely clean, as all of the ingredients remain in the soap. The caustic, also, must be of the highest grade of purity. The fats and oils are warmed to the melting point and a little beyond, and placed in a crutcher, the lye, heated to 80° F., being run in gradually with constant stirring. Replacing a part of the soda lye with potash, up to 20 per cent, improves the soap. When the appearance of the soap indicates that saponification is well established, the soap is run into the frames and left to stand for a week, being covered to prevent it from cooling too rapidly. This method is very popular with makers of toilet soaps, as it is available for small batches, and does not require the costly equipment of the soap-boiling plants.

Specific Properties.—Silicated soaps are produced by mixing silicate of sodium (soluble glass) with ordinary soap. These soaps are cheaply produced, and have very considerable detergent power.

Toilet soaps are produced by perfuming the best ordinary curd-soap with essential oils, or sometimes by saponifying lard, beef-marrow or oil of sweet almonds with caustic soda-lye, in the cold and perfuming the products. They are preferably made of vegetable oils which lather freely.

Shaving soap is made of cocoanut oil as a base with some stearic acid to give hardness. Both soda and potash lyes are used and gum added to prevent its drying quickly. Glycerine is a common ingredient and often a little sugar.

Castile soap when pure is made of olive oil and a soda lye. It soon becomes very hard, however, and to remedy this cocoanut oil or linseed oil is used in the mixture. The cheaper

grades of Castile soap are made from cotton-seed oil.

Light or floatant soap is produced by agitating a solution of soap, to which a fifth or sixth part of water has been added, until the lather has risen to a considerable height, and then transferring it to a mold, where it remains until the quality of transparency is fixed.

Transparent soap is prepared by drying ordinary soap, dissolving it in alcohol, allowing the solution to remain at rest so long as any impurities are precipitated, decanting off the alcoholic liquid and evaporating it until it is of such a consistency as to solidify when cooled in metallic molds. Many kinds of transparent soaps are made by the cold process, the transparency being accomplished by the addition of sugar. Glycerine is often incorporated with transparent soaps for emollient effects, while for disinfecting purposes carbolic acid, coal tar, eucalyptus oil and other substances are added.

Mottled soaps are produced by mixing mineral coloring-matter with the soap during a certain stage of the hardening.

Medicated soaps contain antiseptics, such as carbonic acid, creosote, chloride of potash and sulphur, mixed with ingredients. A soap for the use of taxidermists in preserving skins is produced by the addition of arsenic. A large industry has developed in this country in scouring-soaps, which are produced by the addition of fine sand or pumice-stone to the ordinary soap when in its plastic state.

Soap powders are made by mixing dry sal soda and borax with hot liquid soap, with the addition of a definite proportion of hot water, sufficient to provide the necessary water of crystallization to the soda in its subsequent change. The mixture is stirred constantly until lumps begin to form, when it is piled in trays where the soda completes its crystallization. It is then milled to powder form.

History.—The use of soap is of great antiquity. A well-equipped soap factory was found by the excavators of Pompeii. Historical records of Italy and Spain show that soap was in use in those countries in the 8th century. It was known in France in the 12th century and in England in the late 14th or early 15th century. In 1622 James I granted a monopoly to a soap-maker under which he was allowed to make 3,000 tons a year, and paid \$100,000 a year for the privilege. In 1711 a tax of one penny per pound was laid upon the soap produced by English soap-makers, and in 1816 this tax was increased to three pence per pound. In 1833 it was reduced to one and one-half pence, and this tax when abolished in 1853 was bringing annually into the British treasury a revenue of more than \$5,000,000.

Soap-making in America.—In the American colonies soap-making was at first largely a household art, the housewife utilizing the fats saved from the dripping-pan to make soft soap for her own use, and also even a sort of hard soap, of a quality, however, that would not suit the housekeeper of to-day.

As early as 1608, on the second ship from England to the Jamestown colony, came a number of Germans and Poles, skilled craftsmen, among whom were several proficient in handling fat and soap-ashes. In 1621 soap-ashes for export to England were worth from six to eight shillings per hundredweight, and 50 years later

the settlements now included in Maine and New Hampshire derived their chief wealth from soap-ashes and fat. While there were small soap-boiling establishments in nearly all the large towns by 1795, their aggregate product probably did not exceed \$300,000 in value. The discovery by Nicolas Leblanc (q.v.), about 1791, of a process for manufacturing soda on a large scale was utilized some 30 years later, when chemical manufacturers and soap-makers began to avail themselves extensively of the supply of soda thus cheaply afforded.

Among the early establishments of the soap trade one of the largest was that of William Colgate of New York, founded in 1806. Fancy soaps were at this time unknown, and the makers of the American product contented themselves with a very common grade of soap; but so rapid was the advance that by 1835 they were supplying nearly all the home demands and were also heavy exporters, principally to England.

About 1850 American manufacturers were employing substantially the same methods and processes that were used in England. New England was then the principal centre of the manufacture for the United States, although New York and Philadelphia were gaining prominence. At that time filling materials were practically unknown and "settled" soaps were merely run into the wooden frames and crutched for hours, until rendered thick from cooling, or were finished by boiling down. The material was ladled by hand from the kettles into the frames, or put into buckets or tubs and carried and emptied into the frames. The kettles themselves had cast-iron bottoms, to which a wooden curb was fastened by means of cement. The composition of this cement, which was used to prevent leakage, was regarded at that time as a great trade secret, especially when the cement was capable of preventing the leakage for some length of time. The waste lye was run off through a pipe reaching through the wooden curb to a point near the bottom of the kettle. The kettles were heated by open fire, and the contents were kept from burning by stirring them with a long iron rod flattened at the end. The lye was made by leaching wood-ashes, since the use of caustic soda had made very slow advances.

While processes and methods were thus, comparatively speaking, at a standstill during the first four decades of the 19th century, the soap industry nevertheless steadily advanced in importance and prepared itself for the wonderful development that immediately followed the discoveries of Chevreul. That chemist demonstrated the true principles of saponification, and no later improvement, whether in the introduction of the steam processes or in the discoveries and uses of the many new vegetable and animal oils, has been of greater importance. Of the total soap produced at this time Massachusetts was credited with over one-quarter. Five years later the soap industry had grown to great proportions. The manufacture of fancy soaps had already been begun, and in 1850 was established on an extensive scale. Shaving soap, always in great demand in those days, when beardless faces were the rule, was also greatly improved in this decade, and many other of the common toilet necessities of to-day were either first brought out or developed to comparative

excellence at this time. Soon soap-making was facilitated by the introduction of machinery and now there are specially constructed machines designed and adapted for almost every step in the different processes of manufacture where their introduction has been of advantage. At present American soaps are strong competitors in the markets of the world, and in quality they rival the best of European production.

The introduction of sapolio marked a new era in the soap business. It was a combination of true soap and scouring substances in such proportions as to increase to the highest point the advantages of each. The Bath brick of the scullery has gone since its advent, and the principle upon which sapolio was established is now utilized in many forms. See FAT TISSUE; SAPINDACEÆ.

Production.—The 1914 census of manufactures shows that there were in the United States in that year 371 soap-making establishments, with a combined capital of \$92,871,533 and employing an aggregate of 14,172 hands, who earned in the year a total of \$8,087,937 in wages. The raw materials used comprised 546,289,571 pounds of tallow; 13,225,330 gallons of coconut and palm oil; 16,144,786 gallons of cottonseed oil; 123,032,886 pounds of cottonseed roots; 185,310,786 pounds of resin; 55,320 tons of caustic soda, and 140,983 tons of soda ash. The cost of these materials was \$88,866,786. The output comprised 2,064,228,000 pounds of hard soap—of which 169,926,000 pounds were toilet soap—and 57,002,000 pounds of soft soap. The value of the output was \$127,942,441. The increase of production in the 10 years since 1904 was 47 per cent, all in the hard-soap product. The industry is centred in New York, Illinois, New Jersey, Ohio and Pennsylvania, which five States make nearly three-fourths of the entire output of the country.

SOAP-BERRY, the common name of several species of *Sapindus* and of the fruits, which are so rich in saponin that they were employed for the same purposes as alkaline soap, before the days of that article. The Chinese prefer them even yet for cleansing the hair and delicate silks. Certain species of *Sapindus* yield also an edible pulp, although the seeds are poisonous. One species (*Sapindus utilis*) has been cultivated in Algeria for its berries, which the trees begin to bear in from 8 to 10 years, and *S. mukorossi*, another Chinese species, is found in Japanese gardens. Our two United States species have this saponaceous quality also and the berries of *S. saponaria*, indigenous to tropical America and the West Indies and even growing in Florida, are much used for washing linen, although said to be injurious if employed too frequently. See SOAP-PLANT.

SOAP BUBBLES, originally a simple experiment for pleasing children, produced by making water quite soapy and preferably warm and then dipping a clay smoker's pipe or a tube into the water, withdrawing it with a film of soapy solution of water across the aperture or bowl of the pipe. Then by blowing in the tube the bubble is formed and after it attains some size may be shaken off and float in the air as a spherical balloon if the interior air is warmer than the outer air. A little glycerine in the soap makes them much more durable. Bubbles in their scientific aspect have been studied specially by Plateau, who, by adding glycerine in a certain proportion to the soap solution, obtained remarkably durable films and bubbles. The spherical form of the ordinary soap bubble is a direct result of the action of surface tension, the geometrical condition being that with given volume the surface must have minimum area. Thus, if two or more soap bubbles are joined, which is an easy matter, the joined surfaces are approximately a flat plane; but in reality the smaller bubble projects or curves slightly into the larger bubble, because the smaller the bubble curvature the greater the tension. One bubble may be blown within a larger one and then if gently shaken may chop through so as to hang from the larger bubble in outer contact. It has been demonstrated that this is due to electrification. With a well-soaped wire and thread it is possible to open up a soap bubble in the centre and to bring it to a ring form (like a cruller) without breaking. In making this delicate experiment all dust must be excluded. Consult Boys, C. V., 'Soap Bubbles' (in 'Romance of Science Series,' London 1900).

SOAP-PLANTS, numerous plants of various families that contain a poisonous principle called saponin, which lathers in water, and is utilized as a detergent, both medically and for laundry purposes. The common soap-wort is the European *Saponaria officinalis*, often found in America along roadsides and railways, as a weed escaped from gardens. It is a rankly growing, smooth and shining perennial, with the characteristic, opposite leaves, in this instance broadly oval, and five-merous flowers of the pink family. The obcordate petals are long clawed, with a scale at the base of each blade, ranging in hue from white to bright-rose color, and the dense terminal corymbs would be handsome were they not marred by fading flowers and brown seed-capsules. The thick roots and leaves abound in saponin, and besides its employment in the laundry, the plant was formerly used as a cure for itch; it also yields an alterative drug resembling sarsaparilla. The cow-herb (*Vaccaria vaccaria*) also contains saponin. Soapbark or quillaia-bark (q.v.) is a stimulant and irritant drug, the brownish-white cortex of *Quillaia saponaria*, a smooth evergreen tree native to Chile, where its inner bark, reduced to powder, is a substitute for soap. *Pithecolobium* of several species are leguminous trees, one the savonette or shagbark of the West Indies, which yields other soap-barks, in demand for cleaning delicate fabrics. There are also several Chinese trees, which serve the natives for soap, especially valuable in washing silks and the hair. The fruit of *Pancoria delaryi* of China resembles the soap-berry (q.v.), and the pods of *Gymnocladus*

chinensis, and certain species of *Gleditschias*, give more substitutes for soap. The refuse or "oil cake" of the seeds of the tea-oil tree (*Camellia sasanqua*), after the oil has been expressed, is not only employed in washing, but for catching fish. When the seeds or the oil cake are bruised and thrown into water the poisonous saponin stupefies the fish, which rise to the surface and are easily captured.

Amole is a Mexican name covering several plants having saponaceous and cleansing properties and utilized by the natives of Mexico and the adjacent regions of the United States. *Agave heteracantha* is a common example. The California soap-plant, or soap-root (*Chlorogalum pomeridianum*), is a liliaceous plant, with wavy-edged, linear leaves and a tall branching panicle of many white flowers. The root is a bulb one to four inches in diameter, invested with dark-brown fibres. This bulb is pounded up by the California aborigines, who throw it into pools where fish have no means of escape, stupefying and capturing them. Hot soap-root is used to cleanse and heal old sores as well as in the laundry. There are several other soap-plants, as *Zygadenus fremontii* and *Leucocrinum montanum* in California, and *Acacia concinna*, the soap-nut, the pods of which are used in India as medicines and detergents, especially in hair washing.

SOAPSTONE. See TALC; MINERAL PRODUCTION OF THE UNITED STATES.

SOBAIPURI, a former tribe of the Piman stock of North American Indians in the main and tributary valleys of the Rio San Pedro and Rio Santa Cruz and on the Gila between those two streams in southern Arizona. The Jesuit missions of Guevavi Suamca and San Xavier del Bac were established among them in the latter part of the 17th and the early part of the 18th centuries, but owing to the depredations of the Apaches they were forced to abandon their rancherias and to join the Pimas, by whom they were absorbed.

SOBAT (sō-bāt') RIVER, Africa, a tributary of the White Nile, rising in southwestern Abyssinia, at an elevation of about 7,000 feet, flowing westward and joining the main stream about 450 miles south of Khartum. It is a wide, deep and rapid stream, bringing down large quantities of sediment of a whitish color, whence, probably, the name of the White Nile. At one point it passes through a canyon 2,000 feet deep, the adjacent mountains rising nearly 4,000 feet above the waters. At the confluence the two rivers meet each other from opposite directions, and the sluggish current of the White Nile is often stemmed and forced back by that of the Sobat, forming a temporary lake.

SOBBING, a convulsive heaving of the breast; heavy sighs attended with weeping. It is essentially a respiratory act, depending immediately on nervous irritation, and caused by spasmodic movements of the diaphragm or midriff, but ultimately due to strong emotion, usually painful, though often merely hysterical. In sighing the glottis is temporarily closed and thus prevents entrance of air into the lungs.

SOBIESKI, sō-byēs'kē. See JOHN III, SOBIESKI.

SOCAGE, sōk'āj, or **SOCAGE**, a tenure by any certain and determinate service. It is of

two sorts — free socage, where the services are not only certain but honorable, and villen socage, where the services, though certain, are of an humbler nature. It has practically disappeared in the United States by the development of State legislation, but under the English system of land tenure still exists in some quarters. It appears a bad business arrangement between landlord and tenant, as certain service may be performed in lieu of rent, nearly always an irksome condition. It was very common in mediæval England.

SOCIAL BRETHERN CHURCH, The, a religious organization formed in 1867 and comprising churches and congregations in Illinois, Arkansas and Missouri. The Confession of Faith published in 1887 provides for Baptism and the Lord's Supper as in other Evangelical churches. The Church has ordained and licensed ministers and also exhorters, stewards and deacons.

SOCIAL CENTRES. The term social centres is specifically applied to the special institutions which have quite recently developed in this country, but in a broader sense comprises also the *wider use* for social purposes of existing institutions, such as the school and Church.

The movement in either of these forms represents a new and important step in the institutional life of the United States and one of great significance for the future. It is widespread and powerful in scope, being active in not only the greater cities and the open country, where the need for such is more specially apparent, but is gaining strength in the towns and villages. In general, it expresses and embodies the growth of neighborhood or community feeling and furnishes a common focus for the activities which result. The need for such is well-nigh universal and urgent. Already strictly private and commercial enterprises and interests has sought to pre-empt this social field. The function is too vital for such to be allowed. The social centre must be public and affiliated with the deepest and soundest interests of our common social life.

The need for such is apparent when it is seen that American life presents a multitude of social centres for the greatest variety of social activities, religious sects, fraternities, clubs and associations of all kinds. Both the activities and the meeting places are multitudinous. The variety of such is one of the most characteristic features of American life. But they tend to disintegrate the neighborhood and the community rather than to draw it together, and only to further enhance the already over-developed individualism which lies at the base of so many of our problems of social and civic life.

This general condition is, of course, the result of the eclectic composition of our people, gathered from all the peoples of the earth, of all religions and languages, traditions and habit. Not only so, but the expansion and numerical growth of our population, ever spreading into new country and building new communities and neighborhoods, with ever coming and going people, has promoted a strong individualism. The break-up of neighborhoods and families, the difficulty of common feeling and interest, alike in the city and open country, has been

great. The result has been an astonishing variety of social institutions, which have often tended to further increase, or at least to maintain in existence, separative forces.

The early rise and greatly growing number and form of the fraternal organizations in the United States is one evidence of such a condition and the need for social linkages. These have now attained a membership of more than 16,000,000 adults, mainly men, thus comprising a very large proportion of our adult male population. They include every variety of type and purpose, and the more important of them are practically universal. Their lodges and halls are local social centres of great importance and usefulness.

To these should be added the college fraternities and the vast number of miscellaneous social fraternities and clubs, with somewhat similar purpose. These latter do not maintain separate quarters, but, therefore, only the more increase the demand for social centres. All such, including the specific fraternal societies, are distinctly social in purpose and exist for the benefit that comes from fraternity in an individualistic and separatistic society.

From an early date the public school has seemed to many to be the most vital embodiment of the common life of our people. The beginnings of the movement for specific social centres has been closely associated with its peculiar nature and possibilities as such. There are some 280,000 public school buildings (3,000 additional ones each year) and some 12,000 high schools. They are thus practically *universal*, being located at most a few miles, and nearly always not more than as many blocks, from every American home in the land. They are the first public structures erected in new communities and neighborhoods, and are more and more liable to be the best building in the community. They are essentially public, supported by public taxation to the amount of nearly \$750,000,000 per year. They are the daily gathering centre for nearly 20,000,000 children—"all the children of all the people"—of from 5 to 18 years of age. The private school has had only a slight development as yet under our conditions. Much that is best in the common feeling and interest of every American county or neighborhood is embodied in the school and educational policy. There are difficulties, indeed, in the way of making the school into the social centre, but it has always been, and is every day much more, serving as a social centre. The tradition of its wider use is strong, for in the early days in the new communities it served as church, meeting-house, polling-booth, as well as school and many other social purposes for which with the time special buildings have come into existence.

Nor is the *church* without its claims to be considered as a social centre in a way not unlike the school. There are some 15,000 Roman Catholic churches and nearly 175,000 Protestant churches and meeting-houses. Like the school, the church is universal. Its tradition as a social centre is longer historically and it has advantages over the former of being an adult association and centre and in appealing to wider range of life-interest. The development of the Sunday school and of week-day meetings has also greatly extended its capacity and social significance in the last generation. Much

earlier than in the school, the churches saw their social duty and the opportunity for social service in a society like ours. The *institutional church* was in existence long before any *wider use of the school plant* was conceived. As a result the church adapted its architecture and arrangements sooner and developed power as a social centre. The greater use of the church plant was also more apparent than even in the case of the school. It is fast becoming a very convenient social centre building, for the Catholic Church has developed its separate parish-houses for the like purpose. The modern institutional church thus serves the need for an auditorium, as well as for the miscellaneous recreative and convivial activities of the community. And not only the physical arrangements but also the current spirit of religious work increasingly tends toward the ideal of *social service*. It, too, has conceived the purpose of becoming a neighborhood, or even community centre, for social service. Denominational divergence is its chief limitation in this relation, but the large unchurched masses of our populations, alike in city, village and open country, give large scope to such purposes. The specific *community church* of definitely *social service* methods is becoming increasingly common. Church federation, in various forms, and interdenominational action for many purposes, are fast rendering the accomplishment of the church's purpose to become a social centre more and more feasible.

More recently the great fraternal orders are making their claim to serve as a social centre. The lodges are broadening their membership in various ways to include women, and the more recently organized ones are showing a strong tendency to be more broadly social in method rather than strictly secret or narrowly fraternal. Often, too, their halls are in wide and frequent use as the most available place for miscellaneous social gatherings.

Our communities have, it is true, not yet developed the town-hall or *civic centre* as of the European type. The town-halls of New England and of the North Central States, where its institutional influence has extended, in a minor way often serve this purpose. But for the country in general there is as yet no sign of such a development. The *civic centre* is probably a long way off in our institutional development, although it may some day crown our efforts toward social centres.

In the open country the *grange* is the most widespread of social organizations and its thousands of halls, especially in the North and East States, approach somewhat to the character of social centres.

So the *social settlements*, which have been established in various parts of the great cities, with the object of furnishing neighborhood centres, have, in a sense, pioneered the movement in urban populations. City churches and school administrations have been foremost in the same direction also.

A favoring condition in the creation of urban social centres is the formation of *neighborhoods*. Neighborhood business centres have long been in existence in our cities, and social centres of various types are fast developing. In the expansion of our great cities the communities consolidated retain much of their local feeling. As American life, alike in city and

country, settles down these neighborhood ties will doubtless grow apace.

In the rural districts the passing away of open country life, remote from town and village centres, is rapid. Hundreds of villages are springing up each year in all parts of the country—most notably in the isolation of the rural life of the South—and the 10,000 villages already existing are now fully realizing their function as social centres for their farm-districts. Moreover, the new means of communication and transportation have brought the farmer closer to his neighborhood centre. The significance of the development of the village in our rural districts cannot be overestimated. For, although, in the case of many of the recently developed special community centres, they have been located in the open country, there seems little doubt that the social as well as the business centres of such districts will naturally appear in the villages. This is increasingly true of the "consolidated schools" and of the "new rural churches." More and more the village serves as a locus for the social centres of the rural community.

Such, then, are the more normal, widespread and underlying tendencies making for the development of social centres in American communities and neighborhoods. Much more spectacular and noteworthy but really much less significant are the many *special* and local centres that have been established. Special local or personal conditions have here and there favored the appearance and at least temporary strength of fully developed social centres.

Leadership in this more specific movement should be accorded to educational administrators. E. G. Ward, who developed the school-house social centre in the city of Rochester, may be regarded as the leading pioneer. The *wider use of the school plant* has become a commonplace among educators in all parts of the country. It has taken many forms, but all in the direction of making the school a (if not *the*) social centre. More particularly it has involved use of the building for educational purposes in other than schoolhouses. Evenings and week-ends, holidays and vacations, in fact, during fully one-half of the total available time, the schoolhouse has become useful as a social centre. This has all come about in a few decades. The conception, too, of the educational function of the school has broadened. It is now used for "play" as well as "study," for "work" as well as for "learning." It now gives opportunity to those whose school-education has been interrupted, and even for parents to gather that they may keep in touch with the school's work for their children.

This expansion of use and function began with the development of *evening schools*, especially for the winter months, New York City being a leader. *Vocation* schools followed, and are largely confined to the summer holidays. Vacation use of the *playground* is also now common. Another common use of the school is for *public lectures* and entertainments. Again New York City leads. Schools are also now used as evening *recreation centres* for young men and women no longer in school. Rochester has been foremost in utilizing the schools as *social centres* for adults, as men and

women's civic clubs. The various school facilities, gymnasiums, auditorium, pianos, reading-rooms, useful organized athletics and games for young and old, with folk-dancing, have also been added. Especially in Philadelphia schools are used as *meeting-places* for various civic, educational and philanthropic organizations. Use of the schools for *polling-places* is also being rapidly extended and has great possibilities.

New duties and opportunities for the schools as social centres are thus being yearly conceived and made available. The policy is rapidly extending from the larger centres of leadership to the smallest towns and villages.

The leaders of the country church, in all the denominations, have furthered the movement in this sphere. Notable and successful examples of community rural churches have been created by individual personalities. Especially have the Presbyterian and Methodist Episcopal churches been active in furthering the social service ideal. The most notable ones have been in the open country under especially favoring local conditions. Village churches have frequently seen their future in serving in broader ways the social needs of their community and their rural districts. The redirection of church policy has been not less noteworthy than that of educators.

In a few communities strictly *social centres*, separate from any particular existing institution or establishment, have been created. But these are rare and are rather a foretaste of the future of the movement than an ideal to be held out for practically immediate realization. American local life is ready for *social centres* but not yet for a *social centre*, unless under very special circumstances. Those who have the movement at heart must rather seek to facilitate widespread and normal tendencies making for the realization of their purpose rather than to artificially create a premature institution.

The movement for the development of social centres is thus widespread, arising from the need of all classes of our population, and in all types of community. It has affected every type of existing social institution and almost transformed their material equipment, their spirit and method of work. It is the expression of and the answer to a most fundamental need of our unique social conditions. It has notable and active leadership and already many specific accomplishments. Few social movements in America are more securely established or making more substantial headway. See VILLAGE.

WILLIAM L. BAILEY,
Associate Professor of Political Science, Grinnell College.

SOCIAL CONTRACT, The. 'The Social Contract' was that one of Rousseau's important works which bore most directly on the constitution and ordering of states. In 1743 Rousseau had gone to Venice as secretary to M. Montagu and had acquired some slight practical experience of diplomacy and statecraft. Some time after he conceived a vague project of composing a treatise along these lines, and about a decade later, after the success of his First Discourse, seems to have set himself to work in earnest on an ambitious

volume, 'Political Institutions,' which remained in his mind for years but which was never finished. The work was probably distasteful to its eloquent and imaginative author because of its abstract and theoretical character and was, therefore, laid aside. As an afterthought he later revised or rewrote a section of his manuscript and published it as 'Le Contrat Social' in 1762. This work is, therefore, essentially a fragment, and in his own mind and that of his contemporaries was set on a lower plane than his novel 'La Nouvelle Heloise' or 'Emile,' his treatise on education. It is in this light that it should be regarded to-day.

In writing it Rousseau intended it as applicable only to an ideal communal state of about 20,000 inhabitants whose interests and character were homogeneous. He himself warns against attempts to apply it outside this sphere. His theory involves an organic conception of the state in which sovereignty is represented as the will of the organism. More or less closely attached to this conception are several important assumptions. Government, according to Rousseau, exists by virtue of a tacit agreement with each individual governed. By virtue of this contract every individual agrees to abide by "the general will." The individual citizen thus stipulates that on all questions and at all times it is his will that his state shall be governed by the general will. Therefore, even in cases where the particular individual is overruled by the contrary-minded majority he has the satisfaction of knowing that his fundamental principle of government is being maintained. The greatest danger of Rousseau's system lay in the fact that on this basis he developed a mystical notion that the general will, which in practice is only the will of the greater number, cannot err. He failed, therefore, to put any check on the tyranny of majorities. Much of the radical democratic theorizing of our time, like that of the recall and referendum, find their beginning in the 'Social Contract.' Intended, as we have seen, in the first instance to provide an ideal basis for a small city state, in spite of many interesting suggestions, as a complete or final theory of liberal government on any large scale its doctrines are dangerous. Consult Vaughan, C. E., 'The Political Writings of Rousseau.'

SOCIAL DEMOCRACY, The. See SOCIALISM.

SOCIAL DEMOCRACY, German. See SOCIALISM.

SOCIAL DEMOCRATIC WORKING-MAN'S PARTY. See SOCIALISM.

SOCIAL INSURANCE, a comparatively new term which originated within the last decade in Germany (*Sozialversicherung*) and France (*assurance social*), to cover that field of social or labor legislation, known heretofore as workingmen's insurance, labor insurance or even industrial insurance. The broadening of the term indicates not only the tendency to extend the methods of workingmen's insurance over other groups and social classes such as the agricultural class or lower middle class, but also the desire to draw a clearer line of demarcation between this form of insurance and other branches of insurance conducted as a private business.

Though an enormous literature concerning social insurance has grown up in America as well as in Europe, no generally accepted definition exists, and the new term is somewhat more difficult to define than the older term—workingmen's insurance. In an official report published by the United States government it is defined as "the method of organized relief by which wage earners, or persons similarly situated, and their dependents and survivors, become entitled to specific pecuniary or other benefits, on the occurrence of certain emergencies." Dr. Fr. L. Hoffman defines it—"to comprehend all efforts, methods and means to provide in conformity to insurance principles, a sufficient pecuniary method of wageworkers and others in moderate circumstances as against the economic consequences of industrial accidents, disease, incapacity for work and finally dependence in old age resulting from sickness, infirmity or even imprudence or personal neglect. The absence of a generally accepted definition results from the comparatively recent origin of the term and movement. The point of view is gradually gaining ground, however, that the term cannot be described simply on the basis of the groups to be insured, or the dangers against which insurance is provided, but largely on the basis of the methods, and the attitude of organized society, i.e., the state and its government. Thus there exists private insurance operated for profit, and mutual insurance as a form of mutual protection, but in absence of a definite governmental policy mutual insurance is not necessarily social insurance, which latter comes into existence through legislative action. Historically it holds true that social insurance is still largely workmen's insurance. That is explained by the fact that modern industrial society is based upon a system of wage labor; that wageworkers exist by sale of their labor and, therefore, depend entirely upon the preservation of their working capacity. On the other hand they are more exposed to all possible hazards because of the nature of their work and, therefore, are more in need of insurance protection. Finally the workingmen themselves have laid the foundation to social insurance through the development of mutual benefit societies through several centuries.

Divisions of Social Insurance.—The following divisions or branches of social insurance are at present recognized and exist in some countries:

(1) Industrial Accident Insurance or Workingmen's Compensation; (2) occupational diseases insurance or compensation; (3) insurance against non-industrial accidents; (4) general sickness or health insurance; (5) maternity insurance; (6) invalidity insurance; (7) old age insurance; (8) funeral benefits insurance; (9) widows and orphans' pensions or insurance; (10) unemployment insurance.

This classification is based upon the forms of insurance in actual existence. Many efforts of a systematic classification have been made, usually on the basis of the economic or physical hazards involved. Barring vice and crime or general economic inefficiency and low wages, factors of a general character with which the social insurance method does not concern itself directly, the three conditions which threaten the workingmen's family are: (1) Absence of any

wage-earner through premature death, which may be due to sickness, or industrial or non-industrial accident; (2) the physical incapacity of the wage earner to earn, which may be temporary or permanent, partial or total, and may be due to old age, sickness or accident; and (3) the inability of the able-bodied wage-earner to find a sale for his labor power.

By some of the 10 forms of social insurance above mentioned each one of these three causes of destitution can be met, and destitution prevented by the insurance method of spreading the loss over a larger group, in fact, over the entire community concerned.

The admitted social insurance methods may be classified into four groups or graduations: (1) the establishment of state insurance funds or institutions through which insurance to the workingmen is made cheaper and more attractive; (2) substantial subsidy of the workingmen's insurance by the state offering to pay a part of the premium in further effort to attract the wageworkers; (3) the method of compulsion under which certain groups or classes are required to become insured by virtue of legislative enactment; (4) the method of enforced contributions from employers or industry for the benefit of the insured wageworkers.

In some social insurance systems all of these four methods may be combined, while in others only one of the four may be utilized. Modern students, however, seldom feel justified in applying the term social insurance unless at least one of these four methods is used, while in popular use the term is being somewhat improperly restricted to the compulsory methods.

Considerable difference of opinion exists whether straight governmental pensions paid out of public funds may be included under the definition of "social insurance" since they operate without any consideration of insurance principles or methods. This holds true of old age or invalidity pensions in some European countries and British colonies and widows' and orphans' pensions in many States in America.

Nevertheless textbooks of social insurance usually include these pension systems notwithstanding their deviation from insurance principles. Social insurance is not governed by the strict requirement of private insurance science. It emphasizes the "Assurance" rather than the mathematical accuracy of rates. It merges into what is known in France as "Prevoyance Sociale," in Germany as "Soziale Fürsorge" and may be translated as "social care" of needy individuals.

History.—The origin of social insurance, at least in its modern phase, is usually credited to Bismarck, and to the acts of 1883 and 1884, by which the German sickness and accident insurance systems were established. But as a matter of fact, the elements of mutual insurance, employers' contributions, state subsidy and even compulsion were well known in Germany and partly in other countries before. The acts of 1883 and 1884 were important, however, as establishing the first national system. From Germany the social compulsory insurance movement extended to other Germanic countries, and gradually to all other European countries, until perhaps Turkey remained the only country without any social insurance legislation. The extent, however, to which this branch of social

legislation expanded in each country differs considerably. See WORKMEN'S COMPENSATION; HEALTH INSURANCE; OLD AGE INSURANCE AND PENSIONS.

The compulsory principle met with considerable opposition outside of Germany and Austria-Hungary for perhaps a quarter of a century. In opposition to it, the Latin countries, Italy, France, Spain and Belgium, experimented with the method of subsidized liberty (*liberté assistée*), i.e., by granting more or less substantial subsidies to stimulate voluntary insurance. The Scandinavian countries showed a tendency to follow the Latin principle. Great Britain remained indifferent, leaving the problem to the spontaneous efforts of mutual insurance, and the Slavic world neglected this as well as other branches of labor and social legislation. Within the last 8 or 10 years there has taken place a very marked development in the attitude of all Europe to this question of compulsion in social insurance. So many compulsory insurance systems against sickness, old age, employment, etc., were passed between 1909 and 1914, (when the European War put a temporary halt to all constructive social legislation), that it is highly inaccurate to describe the compulsory method as a Germanic method. Compulsory compensation for industrial accidents is fairly universal in Europe, compulsory health insurance is found in 10 countries, while voluntary subsidized insurance exists in four. France and Sweden have followed Germany's example in establishing compulsory old age insurance. Great Britain marked a very important step in 1911 by establishing at once systems of compulsory insurance against sickness, invalidity and unemployment. In many countries without a general compulsory system, partial systems for certain industries exist, and in several others many steps have been taken for an establishment of compulsory systems, and these were only postponed through the action of the war. Social insurance legislation was perhaps the most important topic of legislation in Europe during the last decade. The entire modern social insurance movement proceeds from the theory that not only is the individual wage-worker unable to meet the hazards that face him, or the cost of insurance against them, but that also holds true of the wageworkers as a group. Financial assistance is, therefore a very essential principle of social insurance. In regard to industrial accidents the principle is fairly generally recognized that they constitute a proper charge upon industry, and with a few minor exceptions, industry through the employer is made to bear the entire cost. That is also true of occupational diseases wherever they are specifically provided for. Health (or sickness) insurance has developed upon a basis of joint contribution of employers and employees in proportions varying in different countries. The more recent enactment added, however the principle of state subsidies so that in the Acts of Norway, Great Britain and some others, the cost is divided between employer and employee and the state. In invalidity and old age insurance this method of contributions from three sources has been recognized in the beginning and gradually the advantage of distributing the cost between employer, employee and the state (or in some

cases the local geographic and administrative unit) are gaining the position of a general social insurance standard.

In favor of such a method the advantages of a wider distribution of the cost are emphasized. It is argued by some students that the same advantages can be achieved in a very much simpler way by putting the total cost at once upon the state. This has expressed itself in the old age pension systems of Great Britain, Denmark, France and some Australian countries, in a few maternity pension acts and some 20 mothers' pension acts in the United States. Further extension of this method of gratuitous pensions, at least in some branches, does not appear impossible.

Development in United States.—Interest in social insurance problems in the United States is very recent, and scarcely extends over six or seven years, though of mutual efforts toward insurance of workmen there have been many. Trade unions, fraternal societies, large employing corporations, railroads, municipalities and some other political entities have tried to build up some systems of insurance protection of wageworkers. In a legislative way the problem began to attract attention only toward the close of the first decade of the 20th century, when the movement of compensation legislation spread throughout the country. Though the early acts were declared unconstitutional in 1911 and 1916, 32 States passed accident compensation acts, and compensation is almost universal outside of the black belt. Almost simultaneously with that, from 1913 a very active agitation for mothers' pensions developed which proved successful in more than 20 States. Old age insurance and pensions have been discussed for some years, and were made the subject of several State investigations with occasional endorsements of the underlying principles, but as yet without any specific recommendation for immediate action. The unemployment situation of the years 1913 and 1914, especially coming after the establishment of the compulsory unemployment insurance system of Great Britain, has stimulated interest in this most difficult branch of social insurance. But the strongest recent development has been in the direction of social health insurance. In 1915 an investigating social insurance commission was provided for in California, and in 1916 in Massachusetts, both specializing in the problem of health insurance. The American Association for Labor Legislation has a standing committee on social insurance since 1912, devoting most of its work to health insurance. The first National Conferences on Social Insurance were held in Chicago in June 1913, and the second one under the auspices of the United States government in December 1916. The California commission in its report recommended health insurance legislation as the most practical solution of pressing social problems after workmen's compensation. It advised the adoption of the compulsory system. Because of the probability of a law of this kind being declared unconstitutional by the State courts, a constitutional amendment was submitted to the voters in 1918, and meeting with violent opposition from the Christian Scientists and from the commercial insurance companies, was rejected. Up to the beginning of 1919 Massachusetts was the only State which provided vocational training for

industrial cripples as part of its compensation scheme. Eight State legislative commissions were investigating the subject of health insurance in the winter of 1918-19. Organized labor was pressing more insistently for the enactment of compulsory health legislation. The New York State Federation of Labor placed health insurance first among its demands on legislative candidates in 1918. Despite this a reactionary legislature in the 1919 session defeated all efforts to enact health insurance legislation in New York. Members of the medical profession were opposed to such legislation. The Massachusetts commission reported in favor of "sickness prevention" in 1918, but made no very definite recommendations as to methods. Among the States which have appointed commissions to investigate social insurance problems are Connecticut, Illinois, Ohio, New Hampshire, Pennsylvania and Wisconsin. Compensation and insurance for soldiers and sailors and allowances for their dependents were provided by Federal enactment in 1917. At the close of hostilities in November the government reported that nearly \$37,000,000,000 had been taken out in life insurance by our over 4,000,000 men of the army and navy; this was the greatest insurance, for such it is, that the world has witnessed hitherto, since the total amount of life insurance carried by commercial and other companies is estimated to be \$3,000,000,000 less than this amount. It is generally admitted that health insurance of a compulsory character will be the logical development from compensation legislation.

The effect of social insurance upon the well-being of the working masses is recognized by students of economic conditions with hardly any exceptions. There are probably some 60,000,000 in Europe who with their dependents enjoy some one or more forms of social insurance protection. The financial operations of the social insurance systems annually measure many hundreds of millions of dollars, which go to relieve destitution and suffering among wage-workers, either in form of pecuniary benefits or medical or similar curative care. A substantial proportion, probably more than one-half of that amount, is contributed by the employers and the State in virtue of the law. But it is frequently pointed out that of more importance than the mere relief of existing distress is the preventive effect. Accident compensation proved to be an important factor in accident prevention, health and invalidity insurance though a better form of organization of medical, surgical and hospital aid is recognized as a powerful factor for general conservation of life and health. Maternity insurance is advocated because of its effect upon the health of mothers, and also as an additional force in the struggle against excessive infant mortality, unemployment insurance to exercise a salutary effect in prevention of excessive depressions, because it preserves to some extent the purchasing powers of the unemployed wageworkers.

As against these advantageous effects, social insurance is being frequently charged with providing a stimulus to malingering. That a certain amount of such malingering develops under social insurance as well as under any other form of insurance is usually admitted, but it is claimed that this evil tendency may be kept in check by appropriate administrative care, and

that it is more than counterbalanced by the salutary results upon the health and happiness of the working class. It is admitted that in no country has social insurance as yet entirely abolished pauperism and destitution, because in no country has this method been developed to its highest capacity, and also because there exists certain factors of destitution not amenable to the social insurance method, but the rapid extension of this method from one country to another is pointed to as a sufficient argument in favor of the advantages to be derived by the entire country by this method.

SOCIAL LEGISLATION, a general term covering laws enacted for the control of social problems arising through modern conditions of vast industrial enterprises and the changed mode of living arising therefrom. Among them are those governing old age pensions, social insurance, workmen's insurance, child labor laws, etc. See SOCIAL INSURANCE, etc.

SOCIAL PSYCHOLOGY. Social psychology is that branch of psychology which deals with the mind as it is affected by and manifested in relations with other minds. It deals with the behavior of human beings and animals in groups, and the emotions and thoughts which group behavior involves. There is a tendency on the part of certain writers to regard it as the psychology of the group mind or of group behavior, while others would emphasize rather the individual in the group and consider it as dealing with the behavior and experience of individuals when they form part of groups. The former hold that the mind of a group of individuals is a real being; something more than the aggregate of the individual minds which compose it. In this article we shall take the position of the latter, that all psychology deals with individuals and that social psychology deals with them in their relations to one another.

Social behavior is manifested throughout the animal kingdom (1) in the form of special responses to living, that is, moving, stimuli; (2) in that of special responses to individuals belonging to the same species, in the tendency to form collections of individuals, to respond with aid to sounds of alarm, to imitate the sounds and movements of other animals, and even, in the case of ants and bees, to assume certain special functions in the service of the social group. Certain individual bees, for instance, take upon themselves the work of ventilating the hive by placing themselves near its mouth and rapidly moving their wings. Social be-

havior is manifested also (3) in the sex reactions of animals, both those connected with mating itself and those concerned in guiding the sexes to each other, through the senses of smell, hearing and sight. It is manifested (4) in parental behavior, where the movements of the parents are adapted to secure the welfare of offspring. From our animal ancestors we inherit all these forms of social behavior as innate tendencies or instincts. Excellent discussions of social instincts may be found in McDougall's 'Social Psychology' and Shand's 'The Foundations of Character.'

The social instincts of man, however, differ from those of the lower animals in being accompanied by imaginative sympathy. The social behavior of animals shows features which indicate that it is not accompanied by any realization of the mental state of others. For instance, an adult wasp engaged in feeding the young, lacking other food to present to a larva, bit off a piece of the larva itself and offered it as food to the larva's mouth. The social behavior of animals is determined wholly by external stimuli and by the animal's physiological state; that of human beings is determined largely by these, but also by the imaginative interpretation of other persons' minds. Thus animals imitate merely the movements of other animals; human beings imitate the mental states of others.

Derived from such animal instincts as the gregarious instinct, the imitative instinct, the fighting instinct, the self-exhibiting instinct, the sex and parental instincts, we have the social emotions, anger, jealousy, sex and parental love, and the sentiments such as admiration, contempt, agreement, vanity and so on. It is possible also to trace the moral sentiments and the religious sentiments to innate roots which are derived from the lower animals. Thus social psychology furnishes the scientific basis of ethics.

The instinct of imitation has been given especial prominence by social psychologists. The French sociologist Gabriel Tarde, in his works, 'Les lois de l'imitation' and 'La logique sociale,' regarded imitation as the most fundamental phenomenon in sociology. He defined a society as a group of persons who imitate each other, and pointed out that, like undulation in the physical world and heredity in the world of life, imitative currents in society spread in geometrical proportion, are modified by the medium through which they pass and interfere with each other. Out of the interferences of imitative currents inventions arise. E. A. Ross' 'Social Psychology' is based largely on Tarde's teachings. Recently the tendency has been to lay less emphasis upon imitation, but it seems clear that only through imitating other persons are we enabled to understand their mental states and that an innate tendency to imitate is the root of that imaginative sympathy which accompanies social behavior in man.

Another instinct which is of especial importance to the social psychologist is, obviously, the gregarious instinct. The different types of social groups formed by human beings are especially interesting to those who regard the mind of a group as an independent entity. We may distinguish groups linked by the sex and parental instincts, i.e., families; groups linked by economic necessity, by a common aim, such as

philanthropy or religion, by likeness of external circumstances or situation, and so on. Each type of group has its peculiar features and the mind of an individual differs according to which type of group he is related to at a given time. It is interesting also to study the mental differences between groups, such as the races and the sexes, separated by congenital unlikenesses.

An innate tendency of the first significance to social psychology is suggestibility. It is really the tendency which we all have to carry out ideas into action, but the term usually indicates this tendency in the case where the ideas are recognized as coming from some other mind. The strongest influence which opposes suggestibility is the fighting instinct, inherited from the lower animals. Individuals vary greatly in the degree of their suggestibility; some persons balk at every suggestion coming from others, even though it be in the line of their own desires, while others are at the mercy of the last person who advises them. Measurement of the suggestibility of a given individual is a task of much practical value in diagnosis. It has been attempted by the method of showing pictures and then questioning the individual about what he has seen. A certain number of the questions relate to details which were not really present in the picture, and the number of such suggestions that the person accepts is regarded as indicating the degree of his suggestibility. Binet, in his '*La suggestibilité*,' developed a number of other simple methods of testing suggestibility, especially in children. Every normal person tends to resist suggestions to a certain degree. Thus Sidis, in his '*Psychology of Suggestion*,' states as the law of normal suggestibility that it varies inversely with the directness of the suggestion; direct suggestions tend to excite the fighting instinct. In certain cases, however, even a normal person will accept direct suggestions. The most important conditions of such acceptance are the prestige of the suggestor and repetition of the suggestion. Indirect suggestions are suggestions given in such a way that they do not obviously come from another mind; they seem to proceed from the individual's own thoughts or from the surroundings. The whole problem of securing the acceptance of suggestions is probably the most practically important part of social psychology. It confronts the advertiser, the salesman, the educator, the religious and the political leader. The psychology of advertising, for instance, is now a distinct branch of research to which the business world is lending strong financial support and from which it is getting valuable returns.

Under certain conditions suggestibility becomes abnormal in degree, that is, the fighting instinct ceases to oppose it. This usually occurs when the field of consciousness is narrowed, so that the criticism which a suggestion ordinarily encounters in the mind of the person to whom it is made is lacking. The suggested idea takes entire possession of the attention, and no reasons for opposing it are considered. Such a narrowing of the field of consciousness, called dissociation, occurs in hysterical states, in strong emotions and in the hypnotic trance. Persons thus abnormally suggestible may be dangerous to the community. The existence of abnormal suggestibility thus is a fact of which the criminal law must take cognizance.

It is probable, however, that no person otherwise thoroughly normal can be hypnotized into the performance of an act of crime. Abnormally suggestible persons are likely to be mentally defective; although Breuer claims that the hysterical temperament is found in persons of the highest intellect and character. Goddard, in '*The Criminal Imbecile*,' records a case of murder apparently due to the abnormal suggestibility of a feeble-minded person in the hands of another individual.

Abnormal suggestibility is interestingly manifested, even by normal persons, in a psychological crowd. A mere aggregate of individuals, however closely crowded physically, does not constitute a psychological crowd. The individuals must have their attention fixed on a common object. As soon as a number of persons concentrate their attention in the same direction, they tend to become abnormally suggestible. This is due largely to the loss of the normal sense of the criticism of others. A considerable portion of the criticism with which a person in the normal state opposes a suggestion is derived from his thought of what persons other than the suggestor may think of his conduct. The feeling that others are with us, as in a psychological crowd, obliterates this criticism; thus persons in a crowd do what they would never do as isolated individuals. Since the emotions are the experiences which all mankind has in common, while ideas vary greatly from one person to another, an aggregate of persons becomes unified into a psychological crowd more quickly under the influence of emotions than under that of ideas. The crowd has the characteristics common to all humanity and often displays instincts which are in the normal individual suppressed; it is incapable of real thought. Since most persons enjoy emotions and dislike to think, most persons enjoy entering into psychological crowds. LeBon's '*The Crowd*' is the classic discussion of the phenomena of crowd psychology.

The phenomena of the religious life offer a fruitful field for the social psychologist. Religion itself, in so far as it concerns the relation of man to a higher personality, is a product of the social instincts, the desire for companionship and protection and is closely related to the gregarious, parental and sex instincts. In the striking phenomena of sudden conversions we have an interesting illustration of the ultimate effect of suggestions which have been resisted. Their effect has nevertheless been registered in the "subconscious" or unconscious regions of the nervous system, and the sudden transformation of the individual's life and ideals is due in all probability to their having accumulated sufficient force to break down the resistance offered to them by processes in the conscious levels of the nervous system. Persons of a hysterical temperament, who are subject to dissociation or splitting of consciousness, are more likely to experience sudden changes of heart and ideals.

Closely related to social psychology, and indeed forming an essential supplement to it, is folk psychology. This is the study of the origins of social phenomena, such as social groups, language, religion and art. These origins must, since they lie in a past long preceding the dawn of history, be studied chiefly through the investigation of the phenomena of savage life.

It is difficult to say how far these really represent primitive levels of culture. In the case of religion, the remarkable longevity of religious rites enables us to trace certain religious ideas back into prehistoric times. The facts point toward the existence, as the earliest known germ of religion, of a prepersonal type of religious attitude, marked by rituals designed to use the supernatural power or virtue, the Mana, in various objects and animals which aroused man's awe; a stage of totemism which preceded belief in gods. In the case of art, a study of savage customs strongly suggests that one group of arts is derived from the dance, which with its power of forming psychological crowds is a great factor in the life of primitive peoples. Music, poetry and the drama are all probably indebted to the dance for their origin. The decorative arts can be studied almost from their beginnings through the preservation of buried objects and of drawings on the walls of caves. It is more difficult to trace the early history of language than that of either religion or art, owing to the rapid and complicated processes of change which it undergoes, and to the fact that when in a primitive state it is not written. The reader will find interesting material on folk psychology in Thomas' 'Source Book of Social Origins,' and in Wundt's 'Folk Psychology' (translated by Schaub).

SOCIAL REFORM PROGRAMS AND MOVEMENTS: Their Historical Development.

I. INTRODUCTION.

The programs and movements for social reform date back in their origins almost to the dawn of written history. Oppression of certain classes existed in the first historic societies and it is not surprising that some of the earliest literature reflects the growth of discontent among the subject groups. As Professor Seligman has pointed out, the desire to improve the social environment has ever been the dynamic impulse back of the evolution of economic doctrines, though it is quite true that theories which have once been the harbingers of progress may later be utilized as a bulwark of the existing order. While proposals for the betterment of social conditions have appeared in all ages, they have been most numerous after great social and economic revolutions which have altered the status of existing classes and have brought an abnormal amount of misery to those whose condition was most seriously affected by the transition. The development of Athens into a commercial empire, the growth of the plutocracy in the Roman Republic, the disintegration of Roman society in the 4th and 5th centuries A.D., the breakdown of feudalism and the origin of the national states, the rise of the bourgeoisie following the Commercial Revolution, that greatest of all social and economic revolutions—the Industrial Revolution of the late 18th and 19th centuries—and the growth of modern imperialism with the expansion of European civilization throughout the world are well-known examples of social and economic transformations which have produced their accompanying programs of social reform. Though it might be interesting to deal in some detail with the early social reform movements preced-

ing the Industrial Revolution, the far greater significance of those which have followed it must constitute the reason for devoting the greater portion of this brief survey to a sketch of the more significant social reform movements and programs which have developed since the opening of the 19th century.

II. SOCIAL REFORM MOVEMENTS BEFORE THE COMMERCIAL REVOLUTION.

Though it was not the first social reform program, the earliest scheme for social reconstruction which has remained a classic through the ages was the 'Republic' of Plato. Here was proposed a society resting fundamentally upon a social division of labor, being physically perfected by an elaborate plan of eugenics, and governed by the wisest members of the community. But even Plato recognized the futility of hoping for the adoption of so rational a social system, and it was marred by another serious defect beyond its utopian flavor on account of the fact that it was designed to apply only to the upper classes; the others would, it was hoped, be reduced to a still more severe and permanent state of subjection. The Gracchi brothers made an attempt to check the growing power of the Roman plutocracy, but the vested interests proved too strong for their efforts. The Apostolic Christians, living in the hope of an imminent return of Christ, developed communistic tendencies and doctrines, but the special circumstances under which they were conceived prevented them from having any considerable significance for the history of social reform programs. While the eschatological conception had been somewhat weakened by the time of the later Patristic period, it was still powerful enough to paralyze any social initiative. The faithful were warned against undue concern over earthly conditions, lest they thereby forfeit entry into the kingdom of heaven. The poor were regarded as a part of the divine order who existed for the spiritual edification of the rich alms-givers. The Patristic outlook, coupled with the static nature of the caste system which developed as the social basis of feudalism, and the general backwardness of mediæval civilization made the "Middle Ages" a period designed to discourage any radical movements in social reform. It should not be forgotten, nevertheless, that the more radical religious movements of the mediæval period, associated with the Waldenses, the Albigenses, the Franciscans and the Lollards, carried with them a varying degree of revolt against the social and economic conditions as well as the religious institutions and practices of the time. It is probable that of all the mediæval programs of social reform the most interesting and progressive was that set forth by Pierre Dubois at the opening of the 14th century in his 'De Recuperatione Terre Sancte,' with which Mr. Powicke has familiarized English and American readers. Finally, the discussions of the Conciliar Movement bear, perhaps, some vague relation to the problem of social reform in so far as that is related to the development of representative government.

III. THE COMMERCIAL REVOLUTION AND THE RESULTING SOCIAL REFORM MOVEMENTS.

While, as Professor Shepherd has insisted, there is need of a greater preciseness of

definition in dealing with the Commercial Revolution as a phase in modern history, it will suffice for the purposes of this survey to regard it in the conventional manner as the period of discoveries and colonization which began in the late 15th century and lasted for about three centuries in its first phase. With it should be associated its epoch-making reactions upon European civilization in nearly every field. This great transformation brought with it the decline of the feudal order, the rise of the merchant class in the political as well as the economic field and the gradual development of the modern national state, at first purely dynastic but later becoming more and more a representative if not a democratic institution. At first the new merchant class or bourgeoisie supported the kings in their attack upon the feudal nobility, but once the feudal lords had been coerced the middle-class arose against the monarchs and brought them within the restraints of constitutional limitations upon the royal prerogative. The social and economic effects were not less distinctive. The manorial system was undermined or completely shattered; the gild system was weakened or wholly supplanted by the "domestic system"; and the above changes profoundly affected all social classes, working its severest effects upon those whose status was reduced by the transformation. In the intellectual realm the curiosity stimulated by the discoveries led to those great scientific advances in nearly every field for which the 17th century is conspicuous.

The social philosophy which was produced by the Commercial Revolution bore a close relation to the political, social, economic and intellectual setting which was created by it. In the field of political theorizing the royal absolutism was accompanied by the divine-right doctrine, associated with the names of Filmer and others, while the rise of the bourgeoisie against despotism produced as a philosophy of justification the social contract school with their apologies for revolution in the writings of Sydney, Locke, Rousseau and their followers. The social and economic changes, with their accompanying misery to the lower classes, gave rise to the various "utopias" which attempted theoretically to construct ideal societies which would embrace none of the evils of existing conditions. This class of writings was best illustrated from widely differing points of view by Sir Thomas More's 'Utopia,' Francis Bacon's 'New Atlantis,' Tommaso Campanella's 'City of the Sun,' James Harrington's 'Oceana' and François Fénelon's 'Télémaque.' The growth of rationalism was especially significant for the development of social reform programs. While the relationalists were rarely violent political or social revolutionists, nevertheless, as Professor Robinson has made clear, their very scepticism concerning current views on the nature and significance of natural and social phenomena inevitably led to a critical attitude toward social institutions and the gradual development of a "spirit of reform." Particularly important in this respect were the doctrines of the English Deists and their followers among the French Philosophes. Taking their premises from the laws of mechanics governing the natural universe, which had been discovered by Newton and his predecessors, the Deists insisted that there was a natural order—a régime

of natural laws—which governed the social system as well as the natural universe and to which social institutions should conform. They held further, in radical contrast to the depressing theological views of Augustine and Calvin, that man is inherently decent and worthy of study in the effort to improve his earthly environment. This doctrine did more than anything else to remove the obstacles to social self-improvement which were embodied in Augustinian eschatology and the predestinarian anthropology of Calvin, and was very effective in producing the growth of a humanitarian spirit. Strangely enough, however, a part of their cosmic and social philosophy became itself a great barrier to social reform when their notion of the "natural order" was adopted by the adherents of "economic liberalism" to form the metaphysical basis of their defense of *laissez-faire*. Finally, it should be remembered that, in spite of the fact that it was designed wholly in the interests of the upper classes, the extensive legislation involved in Mercantilistic commercial regulations furnished a precedent for widespread state activity which might one day be exerted in the behalf of the proletariat.

The French Revolution has long been regarded as a unique and heroic event in human history, but recent analysis has proved it to be but a final phase of the reactions of the Commercial Revolution upon France. Henry IV, Richelieu and Mazarin, with the aid of the new middle-class, had destroyed the political power of feudalism, but had successfully stifled the growth of representative or democratic institutions in France. The French Revolution marked that stage of development in which the bourgeoisie ended even the economic and social vestiges of feudalism and terminated irresponsible royal despotism. The social revolution achieved by the French between 1789 and 1795 consisted mainly in the despoiling of the feudal landlords and the elevation of the middle or business class. The latter not only attained unto political power, but also secured legislation giving far greater freedom to business enterprise. No other class profited materially from the Revolution, while the nobility and the clergy were greatly reduced in wealth, power and prestige. The programs of social reform put forth during this movement varied all the way from the advocacy of limited constitutional monarchy by Lafayette and Siéyes to the fantastic radicalism of the Mountain and the openly avowed socialistic proposals of François Babeuf, which might be quite properly classed as akin to the utopias of the preceding century. But in spite of some radical programs of social reform and some mob-violence by the proletariat, the lower classes, both agrarian and industrial, failed to profit to any marked degree through the French Revolution, which was above all a bourgeois movement. For the elevation of the proletariat in France, three subsequent revolutions and the growth of modern industrialism were required.

One of the most important and far-reaching effects of the Commercial Revolution upon social history was its preparation of Europe for the more sweeping transformation in the Industrial Revolution. By breaking up the feudal system and agrarian isolation, by stimulating commerce and the growth of capital, by inviting colonial enterprise and the development of for-

eign trade, and by developing constitutional government to give business liberty and security, the Commercial Revolution paved the way for the coming of the Industrial Revolution. That the latter came first in England is to be explained by the fact that England had participated most extensively in the Commercial Revolution, that her industries and natural resources were best adapted to the adoption of a mechanical system of manufacturing, and that she had developed to the greatest degree of any country in Europe that constitutional and legal protection to industrial and commercial enterprise which was indispensable to any extensive expansion of business.

IV. THE INDUSTRIAL REVOLUTION AND THE SOCIAL PROBLEMS IT CREATED.

It will be quite impossible in the space available to describe the mechanical inventions which constituted the material basis of the Industrial Revolution or even to enumerate all of its diverse results. For this the reader must be referred to the preceding article in this Encyclopedia by Prof. E. L. Bogart on the INDUSTRIAL REVOLUTION. It will suffice at this place to describe it as that great economic transformation which introduced the mechanical era of manufacturing and the improved motive power for transportation and the communication of intelligence, together with the great social, political and intellectual changes which accompanied the economic transition. The effects of the Industrial Revolution amount in their totality to modern civilization, but only a few of the more generally recognized results can be mentioned here. Through the introduction of machinery, the minute division of labor and the specialization of industrial processes there resulted a vast increase in the volume of commodities produced for sale and a great consequent expansion of commerce, leading to that search for new markets which constitutes the connecting link between the Industrial Revolution and the development of modern national imperialism. The factory system necessitated the congregation of workmen into the new industrial cities which now sprang up for the first time and supplanted the agrarian age. The bourgeoisie were greatly increased in numbers and wealth, and evolved into a distinct capitalistic class. A sharp distinction now arose between capitalist and laborer, and social and economic relationships passed, as Professor Burgess has pointed out, from a personal to an impersonal basis. The laborer became progressively more and more dependent upon the capitalist and the problem of unemployment became much more serious. Women and children were introduced as laborers in the new factories to their moral degradation and physical deterioration. The division of industrial processes into minute stages made it impossible for the workman to complete the manufacture of any commodity and thereby lessened his interest in its production and created a psychological burden which had hitherto been foreign to industrial processes. The machine technology, as Professor Veblen has explained, brought a psychic and cultural standardization correlated with the mechanical processes of the new order. In the large, however, the Industrial Revolution meant, as

Professor Shotwell has insisted, a transition from an agrarian civilization based on isolation, repetition and stability to the modern order founded upon a dynamic industrialism and the development of world-wide relationships. It has constituted far the greatest transformation in the history of humanity and has produced at least a material progress more notable than the race had yet achieved from its beginnings down to the close of the 18th century.

It was inevitable that so fundamental and sweeping a transformation as this should bring great hardship upon those who suffered most from the transition. Had the proletariat been able to support itself by handicraft trades and by petty agricultural operations their lot would not have been so hard, but at the very time when the mechanical inventions were making handicraft competition impossible an agrarian revolution was taking place in England which ousted the peasantry from their agrarian holdings. The new merchant princes, desirous of attaining the social prestige of the ancient landed nobility and encouraged by the new agricultural methods which had been introduced by Tull, Townshend and Bakewell, proceeded in the period from 1760 to 1840 to buy up most of the land of England for great estates. The peasantry were bought out or evicted and were compelled to take refuge in the new industrial cities, where they became the helpless victims of the avarice and greed of the parvenu capitalist manufacturer. Those who remained in the country and tried to compete with mechanical industry or large-scale agriculture met a fate not less severe than that of those who migrated to the cities. In the cities the great surplus of laborers made wages low and unemployment frequent. The possibility of utilizing the labor of women and children reduced the wages paid to adult males or led to their discharge. All—men, women and children—worked at monotonous labor during excessively long days for starvation wages in dangerous and unsanitary shops amid moral conditions even more deplorable. At night they were herded into cheaply built tenements even less healthy than the shops. As one writer has expressed it, they "lived the life of a machine while working and at other times that of a beast." The chimneys of factories and dwellings were swept by very small children under conditions which meant the permanent distortion and dwarfing of their bodies and serious diseases of the respiratory tract, if they were not fortunate enough to meet an early death. In the mines conditions were, if anything, worse than in the factories. Women and small children, as well as men, worked in damp and dark underground passages amid vermin and filth for long hours at a stretch at the most severe type of physical labor for a pittance. Whatever one may think of their remedies, there is no doubt that the socialistic analysts of these conditions, such as Marx and Engels, have drawn an accurate picture of the horrors of the social conditions during the first stages of the Industrial Revolution. It would scarcely be possible to exaggerate them. One must not, however, forget to give due recognition to these early capitalists for their part in building up the industrial civilization of the modern age, probably the

greatest achievement of human genius, even though it threatens at times to develop into a Frankenstein. Further, it is not necessary to assume that all of these early capitalists were fiends to allow such conditions to exist among the working classes. They were usually in little personal contact with conditions and the old business ethics that had governed the guild and domestic systems were wholly inadequate for the new circumstances, while no new system of industrial morality had yet evolved. Nevertheless, it must be remembered that the conditions in the business establishments in the early stages of modern industrialism resembled what Hobbes imagined the life of man in the state of nature to be, and it is, therefore, not surprising that these evils produced a literature of protest and reform which was unprecedented in volume and variety.

The proletariat found it impossible to help themselves out of the serious oppression to which they had succumbed. In no important country in Europe did they exercise the right of suffrage permanently before 1848, and they played an insignificant part in politics until the last quarter of the 19th century. Labor organizations were forbidden entirely or penalized by unfavorable legislation. Violent opposition to the existing order was made well-nigh impossible by the savage criminal codes of the time which reached their worst form in England where nearly 300 capital crimes were enumerated. Any far-sighted program of self-improvement by the laboring classes through education and enlightenment was impossible of realization, for no comprehensive system of free public education existed in Europe except in Prussia, which was not vitally affected by the Industrial Revolution until the decade following 1870.

V. IMMEDIATE REMEDIES PROPOSED BY CONTEMPORARIES TO SOLVE THE SOCIAL PROBLEMS CREATED BY THE INDUSTRIAL REVOLUTION.

1. Economic Liberalism.—The first great type of reform proposed to meet the new conditions was that which has been designated by recent economic historians as "economic liberalism," but which is more generally known as the economic doctrine of *laissez-faire*, or the political theory of individualism. This body of doctrine cannot be properly appraised unless the historical circumstances surrounding its origin and diffusion are taken into consideration. It began before the Industrial Revolution as an attack upon the archaic legislative restrictions which had grown up as a part of the Mercantilistic commercial and colonial doctrine, and, in so far as it helped to clear away these obstructions, it contributed to the coming of modern industrial society. After the Industrial Revolution had come, however, its later adherents utilized the *laissez-faire* concepts to defend the new capitalistic order and to prevent, as far as possible, the solution of the grave evils it created through remedial legislation.

The founders of economic liberalism were the group of French writers in the middle of the 18th century, known as the *Physiocrats* from the work of one of their adherents, Pierre Samuel Dupont de Nemours, entitled 'Physi-

ocracy, or the Natural Constitution of that Form of Government most Advantageous to the Human Race' (1767). They took their basic doctrine from the English Deists and the French Philosophes to the effect that the realm of social, political and economic phenomena was governed by the same natural laws that Newton and his associates had shown to rule the physical universe. They believed that the perfection of all human social institutions could best be realized by making them conform to this natural order, a condition which would most certainly be produced by a régime of unlimited competition. Accordingly, they vigorously advocated the immediate and total abolition of all restrictive legislation and the introduction of an era of *laissez-faire* individualism. The chief functions of the state were to be the protection of life and property, the erection of public buildings and works, and the promotion of education, so that man might grasp more surely the principles of natural law. Extensive legislation was regarded as dangerous, for it would probably impede the operation of those beneficent natural principles upon which they placed their chief reliance. The Physiocrats contributed views of less significance in their interpretation of social progress in terms of the net product of agriculture and their scheme of a reform in public finance which centered about the notion of a single tax on land. The moving genius among the Physiocrats was François Quesnay (1694-1774), who was ably seconded by Gournay, Mirabeau, Dupont de Nemours, Mercier de la Rivière, Badeau and La Trosne.

The general notions of the Physiocrats concerning individualism and state inactivity, except in the field of abolishing restrictive legislation, received the support of the distinguished French economist and statesman, Anne Robert Jacques Turgot (1727-81) and of the first great systematic writer on political economy, the Scotchman, Adam Smith (1723-90). The chief significance of Adam Smith for the history of social reform is that he embodied the *laissez-faire* thesis in a notable work, 'An Inquiry into the Nature and Causes of the Wealth of Nations' (1776), which received so wide a circulation and attracted so extensive a following for Smith's doctrines that the historian Buckle, nearly a century later, regarded this book as the most influential and beneficial one ever written. Aside from his acceptance of the general Physiocratic position on the proper functions of the state, Smith abandoned to a considerable degree the excessive Physiocratic laudation of agriculture and emphasized the value of commerce and manufacturing industry. Especially did he revive the Platonic doctrine of the importance of the division of labor in increasing and improving productivity, and his emphasis upon the part played by labor in production paved the way for the later views of Ricardo and the Socialists respecting the "labor theory of value."

Smith, however, died before the Industrial Revolution had fully developed even in England, and there is good evidence for holding that he did not even foresee the course of this transformation, much less stand out as an apologist of the new capitalist class. But his

doctrines were of a sort which fitted in admirably with the policy of non-interference which the capitalist manufacturers desired to have prevail, in order that they, if not their employees, might enjoy the "blessings of the perfect freedom of contract." Therefore, his notions were expanded and utilized by the middle class and sympathetic economists to furnish an authoritative theoretical opposition to social legislation designed to advance the interests of the industrial proletariat.

The most extensive development of his concepts naturally took place in England where he had written and where that industrialism which was most congenial to his views was the furthest advanced, but he was honored by reverent disciples in every important European state and in the United States. His most distinguished English disciples were Thomas Robert Malthus (1766-1834); David Ricardo (1772-1823); James Mill (1773-1836); John Ramsay McCulloch (1789-1864), and William Nassau Senior (1790-1864). The one thing which, in particular, distinguished the doctrines of Smith from those of his disciples was his greater optimism, a difference which may be explained by the great change in the economic environment in the interval which had elapsed. While the central importance of these writers was their elaboration of the individualistic hypothesis, each contributed some special interpretation of more or less originality and significance. Malthus held that remedial legislation was not only harmful as interfering with the natural order of things, but was also useless as far as any hope of improving the poorer classes was concerned. He maintained that even though distribution were equalized no permanent good could result, because population tends to increase more rapidly than the means of subsistence, and this disparity between population and available means of support would ultimately be restored and with it would come a return of poverty and misery. Through an excessive birthrate the proletariat created its own misery, and the only hope of permanent relief lay in the artificial control and restriction of the birthrate through the postponement of marriage. Ricardo paid particular attention to the subject of distribution. From the Physiocratic notion that the wages of agricultural laborers tend toward the minimum of subsistence and Malthus' doctrine of population he derived his famous "subsistence theory of wages." According to this theory wages tend to that level which allows the laboring class to exist and perpetuate itself without either increase or decrease; hence the folly of legislation designed to enlarge the income of the proletariat, for the resulting increase of population would prevent any diminution of poverty and misery. Further, Ricardo attacked the landlords by maintaining that rent tended to absorb an ever greater share of the social income, and that their interests were opposed to those of all other economic classes. Finally, he laid the basis for the Marxian theory of value by holding that, within certain definite limitations, value is determined by the amount of labor involved in production. James Mill brought into economic liberalism the utilitarian philosophy of Bentham regarding the maximum good for the largest number, which

Mill and his associates confidently believed to be attainable through the operation of the principles of economic liberalism. McCulloch was chiefly a systematizer of the principles of his school and was the most sympathetic member of the group toward the laboring classes, being a supporter of Place and Hume in the attempt to legalize trade-unionism. Senior represented the final and most extreme stage of economic liberalism through his attempt to perfect economics as a purely abstract and objective science and by his ardent opposition to even the mildest form of legislation beneficial to the laboring classes. While most of these writers took little active part in politics, their ideal "of perfect competition for the employers and subjection for the workers" was eagerly adopted by Cobden, Bright and other members of the "Manchester School" and the Liberal party in their effort to reduce the power and privileges of the landed aristocracy and to enforce and perpetuate the servile and helpless status of the laborers. Further, their notions were widely popularized, and their general views were as much the order of polite conversation in British parlors as the Rousseauian notions of the state of nature had been in the French salons of a half century before.

In France the doctrines of the later version of economic liberalism were espoused by a number of economists, the most notable of whom were Jean Baptiste Say (1767-1832) and Frédéric Bastiat (1801-50). Say's position was very similar to that of Senior. He maintained that political economy was purely a descriptive science and not in any way a practical art. The economist should simply study and formulate economic laws and should never usurp the functions of the statesman. Reversing the position of the Physiocrats, he laid greatest stress upon the productivity of manufacturing, and he was the most enthusiastic of all the eulogists of the new era of mechanical industry. He was the French bourgeois economist of the period as Guizot was the statesman of this group. Bastiat revived the optimism of Adam Smith and, as an ardent admirer of Cobden, devoted his attention chiefly to an advocacy of free trade. The function of the state, he held, was solely to maintain "order, security and justice." So obsessed were Say and Bastiat over the importance of the manufacturing and commercial classes that many of their less scientific followers came to deny that poverty or misery existed.

In Germany economic liberalism was defended by Johann Heinrich von Thünen (1783-1850) and Karl Heinrich Rau (1792-1870), while in America Henry C. Carey (1793-1879) first introduced the classical political economy, though he differed from Smith's later supporters by reviving the optimism of Smith and attacking the pessimism of Malthus. Moreover, he advocated national protectionism in contrast to the free trade doctrines of the others of the school.

Though it will be evident that economic liberalism was as distinctly a capitalistic movement as socialism has been a proletarian agitation—that, as Cliffe Leslie expressed it, "they created a science for wealth rather than a science of wealth"—nevertheless it cannot be

denied that their efforts accomplished much that was good. Before rational state-activity to solve the problems created by the Industrial Revolution could begin in an effective manner it was necessary that the antique rubbish of Mercantilism should be cleared away and this was the great contribution of the economic liberals and their political adherents, even though they offset much of the value of their destructive efforts by obstruction of subsequent progressive legislation. It should also be pointed out in passing that the economic liberals were aided by the contemporary philosophy of Romanticism, with its denial of the possibility of artificially accelerating the rate of political progress, and by the political individualism which had been set forth by Wilhelm von Humboldt, and was later taken by John Stuart Mill in his earlier days and by Herbert Spencer. In England the more notable practical effects of economic liberalism were the growth of free trade, associated with the work of Huskisson, Cobden, Bright, Peel and Gladstone; the abolition of such archaic political restrictions as the Test and Corporation Acts; the increase of the political powers of the middle class in the central and local government by the reform bills of 1832 and 1835; the abolition of slavery in the colonies through the efforts of Wilberforce and Buxton; the repeal of the savage criminal code as a result of the work of Romilly, Mackintosh, Buxton and Peel; the development of a policy of preventive treatment in the handling of the problem of poor relief which was evident in the notable Poor Law of 1834; and the first anticipation of a more liberal policy of imperial government through the leadership of Lord Durham and others. In France serfdom and the gild monopolies were abolished before the close of the 18th century; Guizot directed the Orleanist régime solely in the interests of the capitalists; and Bastiat's doctrines were able to win Napoleon III for free trade. In Prussia, Stein and Hardenburg were able to secure legislation looking toward the complete abolition of serfdom and gild monopolies and the development of municipal self-government. Following 1819 a more liberal economic and commercial policy was embodied in the famous *Zollverein*, the work of Maassen, Bülow, Eichhorn and Von Motz. Most of the other German states followed Prussia in this liberalizing policy, and some, like Baden, quite outdistanced her in this respect. It will be apparent, however, that none of this legislation materially benefited the proletariat. Indeed, some of the legislation of this period was specifically designed to paralyze all efforts of the laborers at self-improvement and the agitators for the abolition of negro slavery in the colonies passed by unnoticed a far worse type of slavery which existed at home among their own countrymen. Such a body of doctrine could not endure long unchallenged in the face of the growth of modern industrialism and the increasing misery of the proletariat.

2. English Philosophical Radicalism and Utilitarianism.—Utilitarianism, a term used by Jeremy Bentham and given currency by John Stuart Mill, is the designation usually applied to the school of writers headed by Bentham (1748-1832) and including, among others,

James Mill, George Grote, John Austin, Alexander Bain and John Stuart Mill. They represented primarily the spirit and tenets of economic liberalism in the field of political theory, and their work constituted the only significant contribution of England to this field between the time of Burke and that of Spencer. Essentially, they were a further development of that philosophical radicalism in England which grew out of English sympathy with the French Revolution, and was represented by William Godwin, Thomas Paine, William Cobbett, Francis Place and that group of literary men, such as Shelly, Byron and Wordsworth, with whose works and ideas Mr. Brailsford has recently made English readers familiar. This group stood in direct opposition to the satisfaction which Blackstone and Burke expressed over the alleged perfection of British institutions and maintained the necessity of radical changes in the direction of eliminating archaic laws, institutions and practices. In his earlier years Bentham might have been logically classed with this group, for his first notable work—'A Fragment on Government' (1776)—was a violent attack upon the complacency of Blackstone. But he gradually developed a general philosophy of reform and thus remolded radicalism into utilitarianism. His doctrines were based upon the hedonistic psychology, which had been anticipated by Machiavelli, Hobbes and Helvetius, and upon the ethical slogan of "the greatest happiness for the greatest number"—a principle earlier enunciated but not greatly developed by Hutcheson, Beccaria and Priestley. Institutions were to be judged according to their contributions to the attainments of this "greatest happiness." His practical program of reform, however, indicated that, like the economic liberals, he regarded unrestricted competition and enlightened self-interest as the chief avenues through which his utilitarian program could be realized. His chief concern was with the abolition of restrictive legislation, but he did urge some positive reforms, such as education of the masses, the extension of savings institutions, public health legislation and prison reform. Further, though Bentham and his immediate followers might seem to have regarded the "greatest good to the greatest number" as best attainable through conferring "the greatest amount of goods upon the business classes," his terminology was one which, if honestly interpreted, was excellently adapted to serving as a basis for urging a large amount of positive remedial legislation in the behalf of the proletariat. In this way the utilitarian premises later became an important force supporting constructive social legislation. In fact, this evolution of utilitarianism is evident even within the circle of its own adherents, for John Stuart Mill eventually evolved from an exponent of marked individualism into a vigorous exponent of social legislation in the interest of the laboring classes and a not unappreciative student of distinctly socialistic proposals. Probably the only important achievement of this group in the way of aiding the lower classes was the work of Francis Place and Joseph Hume in securing the temporary legalization of trade-unionism, but they made important contributions to securing that abolition of obstructive legisla-

tion which was described above in connection with the practical results of economic liberalism.

3. The Rise of Distinct Forms of Opposition to the Individualism of Economic Liberalism.—A. *The Criticism of Economists.*—There were a number of theoretical difficulties in economic liberalism which would naturally attract the opposition of political economists. While Smith had actually assumed to be more concerned with the wealth of a "nation" than of a class, it is, nevertheless, true that his followers seemed to be chiefly concerned with the wealth of the new business class rather than with the problem of increasing the prosperity of the entire nation. This brought upon the school the criticism of economists who presented a national or social theory of wealth and maintained that the increase of the wealth of individuals or classes was no safe criterion for judging of the value of an economic, social or political policy to the state or society. This was the point of view especially of the Englishman, Lord Lauderdale (1759-1839), and the Scotch-Canadian, John Rae (1786-1873). The position of the economic liberals generally and of Senior and Say, in particular, that the economist must maintain his science as a purely abstract and descriptive discipline and severely refrain from advocating any policy of statesmanship or social reform was vigorously attacked by Jean Charles Leonard de Sismondi (1773-1842), an itinerant Swiss scholar. He was the most distinguished and effective exponent in his age of the notion that economics has a distinct function in promoting general prosperity and social reform, a point of view since urged with vigor by economists like Schmoller, Gide, Webb, Hobson, Fisher, Fetter and Seager. He saw clearly that economics should be intimately concerned with the problems of practical statesmanship and applied sociology and, more than any other writer of his time, he foreshadowed modern social economics. Moreover, his practical program of reform embraced most of what is now included in trade-unionism, factory legislation and social insurance. He was a solitary figure in his age, but his doctrines were later accorded respect, as economics swung back more and more to the social point of view. Again, the economic liberals were internationalists and exponents of free trade. This attitude was attacked by the early nationalistic economists, Adam Heinrich Müller (1779-1829), Frederick List (1789-1846) and Henry C. Carey (1793-1879). They defended the policy of a national protective tariff to give national self-sufficiency and prosperity. The nation, rather than individuals, classes or human society as a whole, received their special solicitude. They were not, however, inflexibly dogmatic in this position and List, in particular, held that after the Industrial Revolution had become thoroughly established in a country free trade might be beneficial, but to protect infant industries in the first stages of industrial development a protective tariff was indispensable. Finally, the economic liberals erred in the direction of too great an abstraction and absolutism in economic doctrines. They generalized too much from contemporary conditions and were confident in the universal and eternal applicability of their economic laws and theories. This defect was

corrected by the early representatives of the historical school of economics, chiefly Richard Jones (1790-1855), Bruno Hildebrand (1812-78), Wilhelm Roscher (1817-94), and Karl Knies (1821-98). The predominance of the Germans in this group has led to the practical identification of the historical school with German economists. These writers ridiculed the element of absolutism in the classical economic doctrines and maintained that any set of economic theory could be true only for the society from which the facts or premises were drawn. Therefore, economic theories must change with historical alterations in the economic constitution of societies, and there can be no invariable economic laws nor any valid economic theory which ignores the dynamic element of economic progress.

B. Political Opposition and Humanitarianism.—It has been shown that economic liberalism was primarily an economic philosophy and a political program designed in the interest of the capitalists, who, in politics, adhered to the Whig or Liberal party. It was but natural, therefore, that it would be assailed by the party whose economic and political interests were diametrically opposed to the business element, namely, the landed proprietors who made up the bulk of the Tory or Conservative party. The Tories had a number of reasons for disliking the capitalists. In the first place, there was the social aversion of the aristocrat for what he regarded as the parvenu eager to break into his ranks. Then they felt that the new industrialism had destroyed forever the "Merrie England" in which the landlords were supreme. Again, they entertained a jealousy of the growing political power of the middle class, especially after the latter had forced through the Reform Bill of 1832. Finally, the economic interests of the two classes were fundamentally opposed; the Tories desired a continuation of the Corn Laws to keep the price of grain high, while the business class desired their abolition to secure cheap wheat and, therefore, according to the current economic reasoning, cheap labor. The Tories were extremely fortunate in finding a point of attack upon the capitalists which enabled them to cloak their political and economic aims under the mantle of humanitarian sentiments and to entertain some hope of increasing their political following among the proletariat. This avenue of assault, decided upon by the Tories, was factory legislation which would reduce the prosperity of the manufacturers by compelling them to grant higher wages or shorter hours and introduce better physical conditions and appliances in their factories. Probably too much has been made of this point by recent writers who have followed Arnold Toynbee in emphasizing the political and economic selfishness that motivated the landlord factory reformers. Doubtless many of the leaders in this movement were governed by real humanitarian impulses, but it can at least be said that they were especially favored in finding a line of social reform which harmonized particularly well with their economic and political interests. The leaders in the earlier stages of this "Tory social reform" were Anthony Ashley Cooper, seventh Earl of Shaftesbury (1801-85), Michael Thomas Sadler (1780-1835), Richard Oastler (1789-1861) and

John Fielden (1784-1849). They secured the appointment of the investigating commissions that have furnished the present generation with most of their sources of information concerning the conditions among the laboring classes in England during the first half of the 19th century and obtained much remedial legislation designed to alleviate or eliminate these conditions. It is impossible in the space available to describe in detail the contents of this legislation, but its general character can be indicated. The factory acts of 1802, 1819, 1831, 1833, 1844, 1847, 1850 and several minor laws of the "sixties" secured for the laboring classes in practically all factories the 10-hour day, proper factory inspection, safety appliances, better sanitary conditions and a general discouragement of child labor. Women and children were excluded from mines, and better hours and safety devices provided for in acts of 1842, 1855 and 1872. The distressing evils in the employment of juvenile chimney-sweeps were eliminated by laws of 1834 and 1840. Particularly the work of Ashley was the important Factory Act of 1833 and the famous "Ten-Hour Bill" of 1847. Thus political jealousy and economic rivalry between the upper and middle classes were able to achieve for the betterment of the proletariat much more than the latter and their sympathizers were able to obtain for themselves. While Shaftesbury may have been motivated by some genuine humanitarian impulses in his campaign for social reform, it is doubtful if the same can be said for the continuator of his policy, Benjamin Disraeli (1804-81), probably the most unscrupulous and self-centred politician in English history. That he thoroughly understood the oppression of the peasantry and the industrial proletariat no reader of his 'Sybil' can doubt, but little evidence exists that he was touched by any real personal sympathy for the oppressed and much leads one to the conclusion that his advances to the lower classes were founded upon purely partisan and personal motives and ambitions. In part, he continued Shaftesbury's social legislation, but his appeal for the support of the proletariat was primarily political. By the Reform Act of 1867 he extended the suffrage to the greater part of the urban laboring class. This type of social reform again appeared in England during the Conservative-Unionist régime, when it was particularly associated with the name of Joseph Chamberlain. This benevolent paternalism, born of political rivalry, was confined in its earlier stages chiefly to England, for there alone had the new business class attained to sufficient proportions to attract the organized opposition of the landed interests. It appeared at a later time in other European states, most notably in the case of the Bismarckian social insurance legislation.

C. Early Christian Socialism.—The new capitalism and industrialism and its theoretical apologists among the economic liberals were undeniably associated with materialism and rationalism and this inevitably led to opposition from the Churchmen and the "faithful" of all types. While programs of social reform hostile to economic liberalism were put forward by Catholics, High Churchmen, Broad Churchmen and Dissenters, one unifying purpose runs

through all of their work, namely, the desire to socialize Christianity and thereby to capture social reform for the Church and to attract for religious institutions and practices the increasing gratitude and favor of the numerous members of the proletarian classes.

In the field of Social Catholicism there were a number of interesting developments, particularly in France under the Bourbon restoration and the Orleanist monarchy. The movement began as a revival of emotionalism, obscurantism and political reaction in the doctrines of François René de Chateaubriand (1768-1848), Louis Gabriel Ambroise de Bonald (1754-1840) and Joseph de Maistre (1753-1821), but the growth of democracy affected Church as well as state in France and the exponents of the religious revival clearly understood that if they were to make any headway they would need to liberalize the Catholic standpoint. This was partially achieved by Antoine Frédéric Ozanam (1813-53), who founded the Society of Saint Vincent de Paul and linked up Neo-Catholicism with practical philanthropy; by Alphonse de Lamartine (1790-1869), who attempted to connect the Catholic movement with the growth of republican sentiment in France; by Robert de Lamennais (1782-1854), who tried ineffectively to harmonize Catholicism and the principles of the French Revolution; and by Philippe Joseph Buchez (1796-1865), who adopted the historical viewpoint of the German school of economists, tried to prove the spirit of Christianity to be revolutionary, anticipated the "gild socialism" of Bishop von Ketteler and Franz Hitze, and advocated a scheme of co-operative production and distribution.

The Protestant members of the first important group of Christian social reformers have usually been those specifically designated as "Christian Socialists," but there seems no doubt that this title could with equal accuracy be extended to the Catholic reformers. The leaders in this movement were chiefly Anglican clergymen of the Broad Church party, though there was some support accorded by the Unitarians. The most prominent members of the Christian Socialist group in England were John Frederick Denison Maurice (1805-72), Charles Kingsley (1819-75) and Thomas Hughes (1822-96). Others of influence who adhered to their general point of view were John M. F. Ludlow (1821-1911) and John Lalor (1814-56). Maurice, conventionally regarded as the founder of the movement in England, was especially interested in promoting the cause of the education of the laboring class. Kingsley analyzed the social problems of his day in powerful sermons and telling books, like 'Alton Locke,' 'Yeast' and 'Water-Babies.' Like Buchez, he also urged the formation of workingmen's organizations and the institution of co-operative associations. Probably the most enduring contribution of English Christian Socialism to social reform was the impulse which it gave to the organization of co-operative and profit-sharing societies, of which one—the famous Rochdale Pioneers—has endured to the present day. The co-operative movement spread rapidly on the Continent and has developed particularly in Denmark and Belgium. The other important effects of Christian Socialism in this first stage was its aid to the cause of the education of

the proletariat and the arousing of the interest of the Anglican Church in social reform. The impulse to social reform within the Anglican Church originated by the Christian Socialists attracted even members of the High Church party, and the leaders of that obscurant and emotional reaction—the Oxford Movement—such as Whately, Arnold, Froude, Hurrell, Newman, Keble and Pusey lent their support to the development of trade-unionism and the betterment of housing conditions among the poor. Finally, even the dissenting sects, particularly the Quakers and the newer evangelical organizations, as Dr. Faulkner and Miss Simeral have shown, took a very significant part in agitating for remedial legislation for the poorer classes.

D. The Aesthetic Revolt Against Materialism and Misery.—While the Industrial Revolution has produced nearly all the material comforts of modern life and created many new forms of art and beauty as well, there can be no doubt that in its first stages, at least, the new industrialism with its dismal factories, clouds of smoke and filthy tenements was extremely ugly and repulsive to the æsthetic temperament and to humanitarian impulses. There fore, the new order of things and its supporters among the economic liberals received a vigorous attack from those who were the representatives of the literary and artistic standards of the age. This so-called æsthetic revolt against the origins of the modern industrial order was of a rather varied sort, ranging all the way from the purely cultural protest of men like Matthew Arnold to the conversion of leading literary figures like George Sand and William Morris to open socialistic programs. While most of the leading figures in art and literature during the second third of the 19th century were repulsed by the new industrial developments, a few can be singled out as the leaders in the æsthetic protest. Among these were Robert Southey (1774–1843), Thomas Carlyle (1795–1881), Samuel Coleridge (1772–1834); Charles Dickens (1812–70), Charles Reade (1814–84), John Ruskin (1819–1900), Matthew Arnold (1822–88), William Morris (1834–96), Ralph Waldo Emerson (1803–82), George Sand (Madame Dudevant) (1804–76) and Leo Tolstoy (1828–1910). Of this group the most important were Carlyle, Ruskin, George Sand and Tolstoy. Carlyle is significant chiefly as a critic of materialism and the economic abstractions of the classical school. He had no constructive program of reform further than a willingness to wait for some unique genius to appear with a ready-made solution. Ruskin was as bitter as Carlyle in his criticism of the new industrial society and its ideals, but he offered some solution of the problems through his advocacy of a restoration of the dignity of labor, the institution of a régime of industrial co-operation, state-education, government workshops and state insurance for the working classes. A part of his program bordered on the gild-socialism of a slightly later period, but he set education above all other types of relief for the situation. George Sand, of a slightly earlier period, imbibed freely the utopian and revolutionary socialism of the "forties" in France, and by her writings did much to popularize these notions, in particular the doctrines of Pierre

Leroux. Tolstoy's reform program was especially retrogressive and irrational. He advocated a complete abandonment of the new industrialism, a return to an agrarian age and the organization of the agrarian economy according to the principles of the Russian *Mir*, with its communistic practices considerably expanded. While one can appreciate the real and valid motives for this revolt of the æsthetic temperament against the repulsive features of modern industrial society, this group offered little in the way of workable constructive reforms. Few, except those who went over to socialism, had any real reform program. Only an insane person could accept the proposal of some of them that society should revert to a pre-Industrial Revolution economy where kings lived with less comforts than the average workingman of to-day. Further, even those who, like Ruskin, had some program to offer were scarcely in line with modern industrial democracy, but desired the establishment of some sort of authoritative and benevolent paternalism. In spite of all this, the æsthetic protest was a real contribution to the reform cause, for it effectively insisted that an increase in material gain was no complete justification of a new order of civilization and maintained that modern industrialism must make a place for the realm of the ideal and the æsthetic. The more recent circle of literary critics, of the social order, like Émile Zola, Anatole France, Bernard Shaw, H. G. Wells, John Galsworthy, Maeterlinck and Upton Sinclair differ from most of their predecessors in that, instead of favoring a return to a more primitive economy and social order, they are among the most ardent exponents of radical social reform. Only a few, enamored with the best of older civilizations and seeing only the darkest phases of the present order, have looked back with longing eyes to a by-gone age. In this class may be put Profs. J. P. Mahaffy and Warde Fowler, Ralph Adams Cram and J. A. Symonds.

E. Utopian Socialism and the Reconstruction of the Social and Economic Environment.—It has already been shown that those extremely radical schemes of social reform, which are conventionally known as "utopian," appear in the greatest numbers after some great transition which brings with it an abnormal degree of misery. The Industrial Revolution, the greatest of all such transitions and probably the most productive of accompanying misery, naturally brought forth an unprecedented number of utopian plans for the solution of existing social problems, but all of these programs were more realistic and practical than the somewhat fanciful utopias of the 17th century. In the most fundamental sense utopian socialism of the first half of the 19th century was a revolt against the semi-fatalism of the premises of economic liberalism, which had represented society as the product of natural laws and forces, had accused the proletariat of being the authors of their own miseries and sorrows and had sharply denied the possibility of improving conditions artificially through constructive legislation. Utopian socialism denied this premise of Romanticism, individualism and economic liberalism and revived the notions of the French Revolution to the effect that human intelligence and ingenuity were fully equal to the task of

forging a new social and economic order. They held that human nature is primarily the product of the social environment and that, accordingly, the solution of the contemporary evils was to be found in the creation of a better set of social institutions and practices. They maintained that man can by rational thought determine his own social system and social relations, and some, like Fourier, even claimed that man may by well-conceived legislation anticipate the normal course of social evolution.

The initiator of the utopian schemes of this period is conventionally assumed to be Count Henri de Saint-Simon (1760-1825), though he can be quite as much regarded as the formulator of the chief theses of Comtian sociology and a forerunner of Christian Socialism, and though there is no doubt that the other utopias would have appeared out of the surrounding conditions had Saint-Simon never written. Probably Saint-Simon's most important contribution to social science and ultimately to social reform was his contention that the social problems created by the Industrial Revolution were of so serious a sort that a distinct science of society, or of social reconstruction, must be evolved to deal with them. This goal was at last realized with the foundation of scientific sociology in the works of Auguste Comte, Herbert Spencer and the early Organicists. Saint-Simon's practical program of reform rested upon the reconstruction of society according to two somewhat divergent proposals, namely, the restoration of the practices and principles of primitive Christianity and the handing over of society to the control of a group of industrial experts who would reorganize things in a rational and humanitarian manner. His emphasis on the ability of a purified Christianity to solve current political questions constituted an impulse to the later development of Christian Socialism, while his proposal for a scientific direction of modern industrial society was elaborated by his disciple, Auguste Comte, in the latter's 'Principles of a Positive Policy.' The disciples of Saint-Simon developed his diverse notions. *Enfantin* and *Bazard* emphasized the communistic principles which were to be found in that primitive Christianity which Saint-Simon had so much admired. *Leroux* defended the notion of the social and moral equality of men and stressed the concept of the essential and desirable solidarity of society and of the interests of all social classes. Comte attempted to systematize the new social science of which Saint-Simon had seen the need. The greatest of the French utopians was *François Marie Charles Fourier* (1772-1835). He was one of the most thorough believers in the possibility of reforming mankind through the creation of an ideal social environment. This he believed would be found in an "apartment-house utopia"—a co-operative community or phalanstery of some 1,800 individuals. He hoped ultimately to see human society reconstituted as a world federation of phalansteries, the capital of which was, significantly, to be located at Constantinople. Fourier, wisely, did not plan a society which would wholly abolish all private property or attempt to equalize all classes and individuals, but worked out what he believed to be a proper fractional distribution of the social income between labor, capital

and enterprise. While he did not profoundly affect France, no other member of the utopian group attracted so large and sympathetic a following in America and many phalansteries were established in the United States, the most famous of which was *Brook Farm*, founded and conducted by some of the most noted members of the "Brahman caste" of New England literary lights. The remaining French utopian reformer was *Etienne Cabet* (1788-1856), whose followers established an experimental community first in Texas and later in *Nauvoo, Ill.* The leading English utopian was *Robert Owen* (1771-1858), who came into the field of utopian theorizing fresh from a practical demonstration of the possibility of establishing an ideal industrial community. At the cotton mills in *New Lanark* he had organized an advanced industrial community, which, at the opening of the 19th century, possessed most of the features which characterize the more progressive industrial organizations of the present day and which was unique at that time. While Owen gave his support to almost every type of constructive philanthropy which was current in his day, he is known especially for his agitation in the cause of factory legislation and trade-unionism, his vigorous advocacy of industrial co-operation and his concrete plan for ideal industrial communities. The latter did not differ markedly from that of Fourier, though each group was to be slightly smaller. Though his plan was adopted in several places in the United States, most notably at *New Harmony, Ind.*, it resulted in little practical success, and the enduring mark which Owen left on social reform consists chiefly in his support of every means of aiding the solution of existing evils and his emphasis upon the peculiar virtues in co-operation. But significant as were the premises and the achievements of utopian socialism in emphasizing the ability of society consciously and artificially to solve its own problems, this type of socialism could scarcely lead directly into Marxian socialism. It was too impractical and, from the standpoint of the Marxian, it was not sufficiently democratic. The Utopians did not set forth plans designed to aid the proletariat alone, but aimed at a reconstruction of all of society. In a very real sense they were as much the forerunners of modern French "solidarism" as of Marxian socialism. Between utopian and Marxian socialism there intervened the stage of "transitional socialism" by which socialism was made a revolutionary and a proletarian movement. More recent echoes of the utopian movement have been *William Morris'* 'News from Nowhere' and *Edward Bellamy's* 'Looking Backward.'

F. Transitional or Revolutionary Socialism.

—The most important figures in the so-called transitional socialism were the Irishman, *William Thompson* (1785-1833); the Frenchmen, *Louis Blanc* (1813-82) and *Pierre Joseph Proudhon* (1809-65), and the Germans, *Wilhelm Weitling* (1808-70), and *Ferdinand Lasalle* (1825-64), though Proudhon played a more prominent part in founding modern anarchy and Lasalle is equally distinguished as an advocate of state socialism. As far as his practical reform program is concerned, Thompson was a disciple of Robert Owen, but his 'Inquiry into the Principles of the Dis-

tribution of Wealth most Conducive to Human Happiness' (1824) contained a very clear statement of the famous Marxian postulate of the doctrine of "surplus value." He maintained that labor produces all value and should get the whole product, but under capitalistic society it is exploited out of a great part of its just income. Louis Blanc was one of the first to insist that the only effective help which the proletariat could expect must come from their own efforts. He believed that the laboring classes would have to triumph through revolution, and his post-revolutionary program consisted in "social workshops," which practically meant state support and control of industry according to a democratic plan of organization. In the French Revolution of 1848 his plan was tried, but, as it was operated by his enemies who solely desired to discredit it, the scheme proved a hopeless failure. Proudhon made an especially bitter attack upon the institution of private property, or rather upon the abuses of private property which then existed. But he was equally critical of the doctrine of communism. He proposed to base the income of everyone solely upon the amount of labor performed, the unit value of which was to be equal and uniform among all members of society. He attempted to secure the establishment of a national banking system founded upon this labor script following the Revolution of 1848, but he failed utterly in this. Standing at the opposite pole from Say and Bastiat he is chiefly significant for his effective onslaught upon the abuses of the bourgeois régime. Weitling, a Magdeburg tailor who later came to the United States, anticipated Marx by a comprehensive and trenchant review of the evils which modern industrialism had brought to the workingmen and by an eloquent appeal to the proletariat, urging them to rise in their own behalf and overthrow their capitalistic oppressors. Lasalle stressed the fact that the laborers could only escape from bondage through political activity and assumed a leading part in urging and guiding the formation of a labor party in Germany. His concrete plan for reform was state workshops much like those proposed by Louis Blanc, but this phase of his doctrines and activity had little subsequent influence. Transitional socialism, thus, in many obvious ways prepared Europe for Marxian socialism.

4. Early Philosophical Anarchism.—It might be thought that the economic liberals had attained unto the most perfect apotheosis of the individual, but another contemporary school exceeded them in this respect, namely, the earliest philosophical anarchists. The economic liberals proposed to retain the state for at least the function or preserving life and protecting property, but the anarchists declared for the total abolition of the state and all coercive juristic institutions. The first of this group was William Godwin (1756-1836), whose 'Inquiry Concerning Political Justice' (1793) was probably the best example of the adoption of the extreme notions of the French Revolution by an English social philosopher. He held that all evils in society result from the detrimental effect of coercive human institutions. He proposed that all collective organizations larger than the parish should be abolished;

that the unequal distribution of wealth should be done away with; that the institution of marriage should be wiped out; that mankind should be free from everything save the moral censure of their associates and thereby made ready for their ultimate perfection through the influence of reason. Proudhon inveighed mightily against the state which he regarded as wholly an institution for exploitation and oppression. His ideal society was to be founded upon that combination which may be created in metaphysics, but which has never yet been realized as a practical condition, namely, "the union of order and anarchy." He believed that if the obligations of contract could be enforced society would function perfectly, but he scarcely comprehended that until human nature has reached a higher state of perfection there can be no certain enforcement of contractual obligations without the force of the law behind them. While both Godwin and Proudhon had rejected the utility of the state they had stressed the importance of society—of the concept of humanity. It was left for Max Stirner (1805-56) in his 'The Ego and His Own' (1844) to exalt the individual above even humanity and society, to assert that the individual constitutes the only extant reality, to maintain that the only limitation upon the rights of the individual is his power to obtain what he desires, and to contend that "the only right is might." While these early anarchists were guilty of many excesses of statement and offered no well-reasoned substitute for the state which they proposed to destroy, they did perform a real service in insisting that the state, as long as it was undemocratized, was unjustly oppressive and a legitimate object for the suspicion of those who were excluded from participation in it.

5. The Political Revolutions of 1848.—In the winter and spring of 1848 the masses throughout central, southern and western Europe rose in the attempt to secure for themselves freedom from oppression through participation in political activity. In the German states freedom from political autocracy was desired; in the Hapsburg realms and in Italy not only political liberty, but also freedom from the social and economic burdens of feudalism were aimed at; in France political participation and the overthrow of the oppression of the bourgeoisie were the goal; and in England the "Chartists" hoped to achieve economic betterment and that part in the world of politics which had been denied to them in the Reform Bill of 1832. For various reasons, primarily from a division of the Revolutionists through national, party or economic rivalry, the movements failed in every country, though the abolition of serfdom in the Hapsburg possessions was made a permanent achievement. The failure of these political revolts of the masses turned many into a following of economic channels of attack upon the forces of privilege.

The programs of social reform in the first half of the 19th century had cleared away the archaic obstructions inherent in Mercantilism and had made vigorous assaults upon the succeeding régime of industrialism and economic liberalism from almost every angle, ranging from an æsthetic protest to political and eco-

conomic rivalry. In England some progress had been made toward the beginnings of constructive factory legislation, but elsewhere little had been achieved along this line. Nowhere were workmen freely allowed the right of self-protection through organization. In no major European country did political democracy exist in 1850. There were few constructive programs of social reform of a concrete or practical nature. Only in Prussia was there any free public education. But, in spite of these early failures to achieve permanent results, the ground was being prepared for the rise of those reform movements which have brought the beginnings of economic as well as political democracy into the modern world.

VI. THE RISE OF PRESENT-DAY SOCIAL THEORIES AND SOCIAL REFORM PROGRAMS.

1. The Historical Background.—Before 1850 the new industrial order had thoroughly taken hold only of England but had affected France to a considerable degree. The other European countries were little affected by the Industrial Revolution until the last third of the century. When the new industrialism came to these states it produced a wider following for the programs of reform. Again, the first half of the century was spent by the proletariat and their champions in groping about feeling their way, in formulating impracticable programs and in discovering successful methods of organization and achievement. After 1850 this preliminary training began to bear fruit in successful proletarian movements in both the political and the economic fields. Further, the mad rush for wealth tended to slow down to some degree and even the capitalistic classes became more resigned to the coming of a moderate restriction of their absolute industrial freedom. Finally, the Darwinian biology made any static outlook upon social and economic problems absurd and preposterous.

2. The Effect of the German Philosophy of the State.—The political philosophy of both economic liberalism and utilitarianism had been built up about the thesis of the pre-eminence of the individual, and the state was looked upon as merely the "communal policeman." Aside from the protection of life and property and the erection of public works the chief function of the state was represented as being the abolition of restrictive legislation previously enacted. The notion of the state as the chief instrument of social reform was wholly repulsive to this school and a new doctrine of the state was essential before extensive reform legislation could be given a respectable theoretical foundation. This new theory of the state was found in the doctrines of the German Idealist political philosophers, particularly Hegel. Here was discovered a notion of the state which was wholly reverent, took the community as the starting point of political reasoning and believed the individual capable of finding perfection only as a member of the state. This view was brought over into England by T. H. Green, F. H. Bradley and Bernard Bosanquet. Prof. Ernest Baker thus summarizes the nature and significance of this transformation in political philosophy: "Not a modification of the old Benthamite premises, but a new philosophy was needed; and that philosophy was

provided by the idealist school, of which Green is the greatest representative. That school drew its inspiration immediately from Kant and Hegel, and ultimately from the old Greek philosophy of the city-state. The vital relation between the life of the individual and the life of the community, which alone gives the individual worth and significance, because it alone gives him the power of full moral development; the dependence of the individual, for all his rights and for all his liberty, on his membership of the community; the correlative duty of the community to guarantee to the individual all his rights (in other words all the conditions necessary for his and, therefore, for its own, full moral development)—these were the premises of the new philosophy. That philosophy could satisfy the new needs of social progress, because it refused to worship a supposed individual liberty which was proving destructive to the real liberty of the vast majority, and preferred to emphasize the moral well-being and betterment in and through the community. Herein lay, or seemed to lie, a revolution of ideas. Instead of starting from a central individual, to whom the social system is supposed to be adjusted, the idealist starts from a central social system, in which the individual must find his appointed orbit of duty." This philosophy laid the foundation for state-activity, but it carried with it certain exaggerations and dangers which Professors Dewey and Hobhouse have recently revealed.

3. The Rise of Scientific Sociology.—The general science of society, or sociology, took its origin, as Professor Small has made clear, from the social conditions and reform programs of the first half of the 19th century, which called for some objective science capable of weighing the merits and detecting the defects in the many plans for social reform. Saint-Simon had recognized the need for such a science and it was founded by his disciple, Auguste Comte, and by Herbert Spencer, though there can be no doubt that the science would sooner or later have come into existence had these men never written. Since their day sociology has attracted many students and many schools of sociologists have developed, each embodying some fertile method of approach to the diverse problems with which sociology must concern itself. Comte, Spencer, Giddings, Ward and Hobhouse have developed comprehensive systems of social philosophy; the methodology of the science has been perfected by such men as Le Play, Durkheim, Small, Simmel and the statisticians, such as Quetelet, Jevons, Galton, Pearson, Bowley, Mayo-Smith, Willcox, Chad-dock, Hankins, Durand and others; the biological point of approach has been cultivated by the Organicists like Lilienfeld, Schaeffle, Worms and Roberty and by their more critical successors; psychological sociology has been advanced by Bagehot, Wallas, Trotter, Tönnies, Tarde, Durkheim, Le Bon, Sighele, Ross, Ellwood, Cooley and Sumner; the conflict between social groups and interests has been dealt with by Gumplowicz, Ratzehofer, Oppenheimer, Small and Bentley; the historical mode of approach has attracted Thomas, Hobhouse, Giddings, Westermarck and Durkheim; the significance of geographical factors has been shown by Ratzel, Reclus, Brunhes and Semple;

while close contact with social reform has been made by the scientific students of philanthropy like Webb, Devine and Taylor and a sound basis for social legislation has been formulated by Jethro Brown, Pound, Freund and Lindsay. The attitude of sociologists toward state activity has varied greatly. Comte believed in a thorough program of social reform, but Darwinian biology affected sociology much as Newtonian mechanics had affected political and economic thought for two centuries before. Sociologists of individualistic leanings, like Herbert Spencer and William Graham Sumner, interpreted the Darwinian doctrine to mean that social institutions, like the animal organism, evolved in a spontaneous and automatic manner and that human efforts could only be harmful—a view similar to that entertained by the Physiocrats toward interference with the “natural order” of physical and social phenomena. Others, particularly Profs. Lester F. Ward and Leonard T. Hobhouse, have contended that, while the earliest stages of social evolution are spontaneous, there comes a time when social progress may be artificially controlled and accelerated by the conscious direction of mankind. This dividing line will apparently be reached when statesmen shall have evolved into sociologists. Most sociologists, following Jevons, have avoided dogmatism on this point and have shown that *laissez-faire* and state socialism are policies which may each have their virtues in proportion as they are adapted to a given society, but sociologists are more and more coming to leave the individualist point of view and to stand with Ward and Hobhouse in favoring extensive state activity. While it can scarcely be said that every sociologist is on that account a talented statesman, it is certain that no scientific program of social reform can be formulated independent of sociological investigations or divorced from sociological principles.

4. The Development of Marxian or “Scientific” Socialism.—The origins of the so-called “scientific” socialism are generally and correctly associated with the work of Karl Marx (1818–83) and Friedrich Engels (1820–95). As Prof. Bertrand Russell has well said, “Socialism as a power in Europe may be said to begin with Marx. It is true that before his time there were Socialist theories, both in England and in France. It is also true that in France, during the Revolution of 1848, Socialism for a brief period acquired considerable influence in the State. But the Socialists who preceded Marx tended to indulge in Utopian dreams and failed to found any strong or stable political party. To Marx, in collaboration with Engels, are due both the formulation of a coherent body of Socialist doctrine, sufficiently true or plausible to dominate the minds of vast numbers of men and the formation of the International Socialist movement, which has continued to grow in all European countries throughout the last 50 years.” It would probably be futile to attempt to indicate all the sources of Marx’s views, for he read deeply in all the literature of his age and was in contact with most of the tendencies of his period, but a few of his more conspicuous obligations may be set down. To Hegel he was indebted for his dialectical system and his faith in state activity; his materialistic

philosophy of history he took from Feuerbach; the labor theory of value was derived from Ricardo and Rodbertus; the doctrine of surplus value was found by Marx in the writings of Thompson; the notion of a class conflict and of the necessity of a proletarian upheaval was found in the works of Louis Blanc, Proudhon and Weitling; while from Sismondi he received his conviction that the capitalists would be weakened by the progressive concentration of wealth in the hands of a few men of great possessions. The ‘Communist Manifesto,’ a document drawn up by Marx and Engels for the German Communist League in Paris in January 1848, contained the essence of Marxian socialism. This begins with the economic interpretation of history, the contention that the prevailing systems of the production and distribution of wealth determine the accompanying social and political institutions. Then comes the labor theory of value, the belief that labor produces all value. From this is derived the doctrine of surplus value by pointing to the difference between the total social income and that received by labor. This difference is the surplus value created by labor and out of which it is exploited by the capitalist. Hence there arises the notion of an inevitable and irreconcilable struggle between the proletariat and the capitalists. This cannot but terminate in the overthrow of the latter, for they are being continually weakened by the steady concentration of wealth in the hands of their more powerful representatives, while the proletariat will become progressively stronger through party organization and the obtaining of the suffrage. When they shall have secured a majority in the law-making bodies of the several states the proletariat will rise up and expropriate their oppressors and institute the régime of social and economic democracy which Marx predicted but wisely refrained from describing in detail. These doctrines were elaborated with greater thoroughness and in more ponderous and obscure language in the work on ‘Capital’ begun by Marx and completed by Engels. The enduring theoretical contributions of Marx are his economic interpretation of history and his extremely effective criticism of the individualistic industrialism of the first half of the 19th century, the latter of which “cannot but stir into fury any passionate working-class reader, and into unbearable shame any possessor of capital in whom generosity and justice are not wholly extinct.” Few if any of Marx’s other major doctrines are now regarded as possessing substantial validity.

Marx was also instrumental in establishing socialism as a political force in Europe. The International Workingmen’s Association took its origins for a conference of laborers at the London International Exhibition of 1862. It was organized at London two years later and its principles were drawn up by Marx and adopted at the Geneva conference two years afterward. A German wing started by William Liebknecht in 1864 and, under his leadership and that of August Bebel, it was developed into the Democratic Workingmen’s Association at Eisenach in 1869. In the meantime a German General Workingmen’s Association had been organized and its program enunciated by Lasalle in 1863. These two groups coalesced at

Gotha in 1875 and created the German Social Democratic party. Persecuted by Bismarck from 1878 to 1890 they grew in power until they commanded 110 out of 397 votes in the Reichstag of the old empire and have now captured in a seemingly permanent manner the German government.

The beginnings of the modern French political organization of labor dates back to 1878. Two years later French Marxianism was originated under the leadership of Jules Guesde. But the French socialists for a long time were unable to arrive at the same unity that characterized the party in Germany. Numerous sects developed and there grew up much bitter feeling, particularly between the Marxians, led by Guesde, and the Revisionists or Opportunists led by Jean Jaurès, the ablest figure in the history of modern socialism. An effort to unite these factions failed in 1899, but met with more success in 1905, and the United Socialist party was able to elect 102 out of 602 members of the Chamber of Deputies in 1914, besides 18 members of the allied Independent Socialist party.

The Socialist party organization has made rapid progress in a number of the other chief European countries, notably Austria, Italy and Russia and has reached remarkable strength in some of the lesser states, particularly Finland, Sweden, Denmark and Belgium. In part, this has been the result of the increased strength of the proletariat and, in part, the effect of a moderation of socialistic proposals which has attracted many liberals who refuse to accept Marxian postulates.

5. The English Fabians and the Growth of "Revisionist" Socialism.—In spite of the significance of Marxian socialism in attracting a sufficient following to make it a political and economic movement of the greatest importance, it possessed certain obvious theoretical difficulties which embarrassed its more thoughtful supporters and gave its enemies a vulnerable point of attack. These weaknesses were chiefly the untenable labor theory of value and the deductions from it, and the refusal of the Marxians to co-operate with existing capitalistic governments in securing remedial legislation for the proletariat. A program of reform which was not to begin until after a remote and complete social revolution had been achieved was much less attractive than one which would accept partial amelioration on the road to complete triumph.

This situation was first adequately comprehended by a group of English radicals known as the Fabian Society. They organized out of a general sympathy with socialistic propositions which had been brought before them, in part, by English followers of Marx, like William Morris and H. M. Hyndman, and, in part, by two American radicals, Henry George and Thomas Davidson. The most important members of this group were Sidney Webb, Graham Wallas, Bernard Shaw, Chiozza Money, Edward Pease, H. G. Wells and Stewart Headlam. They derived their name from the Roman leader, Fabius, and their resolution to delay their final convictions until the socialistic movement had developed further. They relied chiefly upon the hope of arousing an intellectual movement in favor of radical social reform and their great significance lies in the fact that they repudiated the fatalism of Marx and

came out for "opportunism," or remedial social legislation through the agency of the existing political organization. They made socialism an evolutionary rather than a revolutionary movement. They were also less enamored with the internationalism of Marx and laid greater stress upon national progress in social reform.

While the Fabians originated the tenets of "Revisionism" the spread of this movement was due more to the agitation of a German socialist savant, Edouard Bernstein (1850-). Bernstein lived in England during the period of the socialist persecution in Germany and was converted to the ideas of the Fabians. Returning to Germany in the early "nineties" he began the dissemination of his new convictions and in his work on "Evolutionary Socialism" he systematized his principles, which were chiefly a denial of the Marxian economics, especially the labor theory of value, a declaration for "opportunism" or piece-meal remedial social legislation, a willingness to co-operate with existing governments and more concessions to the principles of nationalism and patriotism than the Marxians would allow. In other words, he aimed at the practical transformation of socialism from a proletarian party of revolution into a party of radical social reform which could attract the support of non-Marxian liberals. While he was not able to capture the German Socialist party until after the death of Bebel and the elder Liebknecht, the Marxians now constitute a hopeless minority among German socialists and many of the Revisionists have even passed Bernstein in the degree to which they have modified the Marxian doctrine and program. The general history of socialism in every important modern state has been much like that of German socialism; Marxianism has served as the entering propaganda and the growth of the movement has led to the domination of Revisionism. Only in Russia, where socialism did not have long enough a period of development to allow the triumph of "opportunism," have the Marxians remained in the majority. The leading Revisionist Socialists have been Jaurès in France, Emile Vandervelde in Belgium, Filippo Turati in Italy and Peter Struve and M. Tugan-Baranovsky in Russia. The intellectual leaders of socialism in the United States have also generally capitulated to Revisionism, though the majority of the party clings to Marxian principles. Thus, as socialism has increased in strength it has developed moderation. This has been due, in part, to the greater validity and practicality of Revisionism and, in part, to the very growth of socialist power for, as Professor Orth has well put it, "ambition brings power, power brings responsibility, responsibility sobers the senses." Socialism has in this manner been purged of the nightmare of revolution, except in Russia, and while it is undoubtedly increasing in strength almost everywhere it can no longer frighten any person except the one who opposes the very principle of progress.

6. The Rise and Expansion of State Socialism.—Closely related to the principles and program of Revisionist Socialism and in part contributing to the growth and vitality of the former is the so-called "State Socialism." The chief difference between them is that state socialism has primarily come from radical bourgeoisie instead of moderate socialists,

though it must be remembered that in some cases, most notably in that of Bismarckian social legislation, state socialism has been used to aid autocracy and check radicalism. The same general program of remedial legislation is proposed by both, though their ultimate goal is slightly different. The Revisionist hopes for an ultimate proletarian state but plans to ease as much as possible the passage of the capitalist over the Jordan of social democracy, while the State Socialist hopes to retain the capitalistic system with great concessions to the laboring classes. State socialism received some considerable impulse from Lasalle, but its chief early leaders were the German, Karl Johann Rodbertus (1805-75), and the Frenchman, Charles Brook Dupont-White (1807-78). More recently the program of state socialism has received not only the support of statesmen in the German Progressive party, the French Socialist Radical party and the English Liberal party, but also in different degrees from the professorial champions of social reform within the capitalistic state, the so-called "Socialists of the Chair," such as Schaeffle, Wagner and Schmoller in Germany; Bouglé and Gide in France; Webb, Hobson and Hobhouse in England, and Fetter, Fisher, Patten, Seligman and Seager in the United States.

State socialism in actual legislative achievement has made the greatest progress in Germany where there has been enacted an elaborate program of social legislation covering almost every phase of protection to the laboring classes. It has also included the adoption of the state ownership of railroads and other public utilities and a vast amount of municipal socialism. France has made extensive progress in this direction in the latter half of the period of the Third Republic, and Italy, as well, especially in the liberal régime since 1900. Austria has followed much of the example of Germany in this movement, while in England, the home of economic liberalism, even the party of Cobden has been converted to state socialism through a process of change which Professor Hobhouse has clearly explained. Its vigorous leader, David Lloyd George, has secured, in the period since 1905, the adoption of a legislative reform program designed to make Cobden turn in his grave and rived in content only by German achievements. In the United States state socialism made scant progress until the "accident at Buffalo" put Mr. Roosevelt in the Presidential chair. Down to that time the plutocratic admirers of the philosophy of Cobden and Bright, such as Roscoe Conkling and Mark Hanna, had maintained individualism in a position of dominance. While Mr. Roosevelt achieved relatively little in the way of positive remedial legislation, he aroused the spirit of the people in this direction and made possible the very considerable progress in advanced social legislation which has taken place in Mr. Wilson's administration. Of all the enemies of the political postulates of economic liberalism state socialism has to date been the most deadly in practical results.

7. Recent Developments of Christian Socialism.—The growth of social problems and the development of programs of relief have not been without their reaction upon ecclesiastical organizations and policies since 1850. The

Catholic party has been especially active in this matter. In Germany, Adolph Kolping (1813-65) proposed associations of young workmen for religious as well as economic betterment; Bishop von Ketteler (1811-77), F. C. J. Moufang (1817-90) and Franz Hitze (1851-) advocated not only social legislation, but also the organization of gild-socialism under Catholic auspices, but with state financial support, as the best agency for solving modern industrial evils. The program was designed, in part, to weaken the state, the secular rival of the Church, and, in part, to attract the proletariat to the ecclesiastical authorities. The Catholic party in Germany has been strongest in Bavaria, from which the Center party, always an exponent of social reform, has been chiefly recruited. In Austria, Karl Lueger (1844-1910) adopted the program of the German Catholic gild-socialists and organized the powerful Austrian Christian Socialist party. In France, Frédéric LePlay (1806-82) proposed to solve modern social and economic problems by developing the "family group"—an organization midway between the old patriarchal family and the modern family organization. But much more important than this for social reform was his method of studying social problems, for he is rightly regarded as the real originator of the social survey method of social investigation. Much more influential has been the work of Albert de Mun (1841-1914), who accepted the gild-socialist program and organized the Action Libérale Française, virtually the Catholic socialist party of France. Hilaire Belloc and Gilbert Chesterton have tried without success to organize a similar movement in England. Even the liberal Pope, Leo XIII, in his encyclical, *Rerum novarum*, sent out in 1891, advocated remedial social legislation for the laboring classes, espoused the program of gild-socialism and maintained the special solicitude of the Catholic Church for the lowly laborer, whether urban or agrarian.

The social impulse has also affected Protestantism in recent times. In Germany, the fanatical Hohenzollern court preacher, Stöcker, organized what was called a Christian Social Workingmen's party, but which was in reality more Anti-Semitic than either Christian or socialist. Friederich Naumann in the "nineties" also made an unsuccessful attempt to capture German Protestantism for a radical social reform policy. In France, the Protestants have been noted for their philanthropic organizations, but they have never been strong enough to create a powerful party of social reform. In England, the work of Maurice and Kingsley has been carried on by aggressive Anglicans, like Bishops Westcott and Gore, who founded the Christian Socialist Union in 1889, and like John Neville Figgis, who formulated an elaborate theoretical justification of what might be called ecclesiastical syndicalism. In America Christian Socialism was founded in the late "eighties" by Josiah Strong, and Profs. Richard T. Ely and George D. Herron and received its most effective support from Prof. Walter Rauchenbusch in his famous works, 'Christianity and the Social Crisis,' and 'Christianizing the Social Order.' Other adherents to this point of view

have been Professors Francis Peabody of Harvard, C. R. Henderson and Shailer Matthews of Chicago, Harry Ward of Boston, E. L. Earp of Drew and P. A. Parsons of Syracuse. The social point of view has attracted religious radicals as well as conservatives. Indeed, it is probable that the critical adherents to Christian doctrines are the most inclined to stress the social phases in Christianity, for with them the social and ethical elements are about all that remains to be saved and expanded.

8. The Newer Anarchism and the Attacks upon the Bourgeois National State.—Modern anarchism is a revolt against the oppressiveness of the agrarian or the capitalistic state. It is most significant that the two leading figures in the development of the modern anarchist movement have been Russians. At a time when modern industrialism was creating new problems and bringing the necessity of modern democracy nearer to hand, the Russian autocracy tried to maintain a system of government as mediæval and intolerant as at the time of Peter the Great. Michael Bakunin (1814-76) was the revolutionary propagandist of the two great leaders of modern anarchism. He paid little attention to the problem of the details of the future anarchist state, but regarded his chief task to be the spreading of the propaganda of hatred for the state and the organization of a movement committed to its destruction. To him the state appeared as the great and central engine of human oppression and its elimination seemed the one chief need of the time. Once the state was removed the task of the reconstruction of society on anarchistic principles could safely be left to the future generations. Hence, the work of Bakunin was chiefly the dissemination of the gospel of destruction, his views being most systematically expressed in his 'God and the State,' where he maintained loyalty to state and religion to be the chief obstacles to social progress and human liberty. Prince Peter Kropotkin (1842-) is the chief systematic and constructive writer on modern anarchism. According to him the ideal organization of society is the non-coercive community without private property and functioning perfectly through the operation of the principle of mutual aid or co-operation. To support his position he has not only made a theoretical defense of his system, but has also executed a thorough historical study of the importance of the principle of mutual aid from the first animal societies to the present day and has brought forward a wealth of evidence to prove this the chief factor in social evolution, the happy operation of which was terminated by the rise of the modern dynastic and capitalistic state, which has created most subsequent evils without in any way contributing to their effective removal. The communistic, co-operative and non-political group, then, is the goal of the philosophical anarchist. Human nature having been perverted by political institutions, the removal of the latter will restore the pristine virtues of the race—a notion not far removed from the burden of Rousseau's famous second 'Discourse.' The anarchistic views have also received the support of such writers as the Russian, Léon Metchnikoff, and the Frenchmen, Elisée Reclus and Jean Grave. The economic program of the anarchists is not greatly differ-

ent from that of the socialists, as far as the institution of private property is concerned, but their political ideals are diametrically opposed. The socialist proposes a vast increase in state activity, while the anarchist desires the complete extinction of political authority and the substitution of voluntary co-operation. The anarchists have erred in generalizing too much from Russian conditions, which have been incomparably worse than in the more democratic states of western Europe. Further, their movement is entirely unadapted to modern conditions. They are either antiquated or greatly ahead of their time. Voluntarily co-operation may have been possible in a small primitive group or it may be practicable in the far distant future when human nature shall have been perfected, but scarcely at the present time when imperfect humanity faces a complexity of problems of unprecedented volume and when the state is more than ever necessary. The anarchists have done good in showing how much oppression has resulted from autocratic states and in stressing the unexploited potentialities of co-operation, but the remedy would seem to lie in the improvement of the state through democracy and decentralization rather than in the extinction of political authority.

9. The Development of Trade-Unionism and Its Relation to Social Reform.—It was one of the cardinal points of economic liberalism that perfect freedom of contract should prevail in the economic relations of employer and employee, but in actual practice the freedom was chiefly that of the employer to reject the services of the employee. Where one party to the contract could refrain from participation with equanimity while the other party would be threatened with starvation, there could be neither freedom nor equality of contract; unorganized labor was thus wholly at the mercy of the capitalistic employer. On the other hand, if the laborers could combine and withhold the services not merely of one man, but of a large number, the concern of the employer over the failure to make the labor contract could be greatly increased, while the suffering of the employees could be lessened through co-operation in bearing the mutual loss. The desire to meet the employer on relatively equal terms has been the central impulse in the development of modern trade-unionism. The question has often been raised as to the relation between the modern trade-unions and the older gild organizations. It has been shown pretty conclusively that there was no genetic connection between them; in England there was a long hiatus between the end of the gilds and the origin of unions, and even on the Continent there is little evidence that trade-unions grew up out of previous gild organizations.

In England, trade-unionism was early prohibited by the Combination Laws of 1799 and 1800. In 1824 Francis Place and Joseph Hume smuggled an act through Parliament legalizing organization, but this was repealed in the following year. Owen's attempt to stimulate unionism in the "thirties" failed. In the "sixties" the cause of unionism was taken up by the so-called "Junta," made up of Allen, Applegarth, Coulson, Guile and Odger. By acts of 1871 and 1875 organization and strikes were legalized. Though the reactionaries in the

Taff Vale and the Osborne cases (1901 and 1909) tried to weaken the unions, the Liberal party in legislation following 1905 has practically abrogated the effects of these decisions. To-day labor organization is probably the most effective aid to the English urban proletariat. At the outbreak of the World War these unions had about 3,000,000 members. In France, an act of 1864 gave the laborers the right to organize and a later law of 1884 authorized them to strike. Since that time there has been a great increase in the number of unionists, accompanied by a bitter struggle between those who cling to orthodox methods and those who incline toward the greater radicalism of the Syndicalist movement. The French labor unions now boast of over 1,000,000 members. In Germany trade-unionism was originally little impeded by opposing legislation, but it came under the ban during the anti-socialist campaign from 1878 to 1890. Since then it has been little restricted. Most of the German unionists are organized in Social Democratic or "Free" unions, embracing about 2,000,000 members. In no other important country have the unionists so faithfully maintained the ideals of excellent craftsmanship which were so characteristic of the mediaeval guilds. Trade-unionism has spread to most other European countries, though in many, especially in the Romance nations, it has tended toward "Syndicalism." In the United States extensive labor organization began following the Civil War with the Knights of Labor, an organization which declined after the violent strikes of 1886. Their place was taken by the American Federation of Labor, an organization which now numbers about 2,500,000.

The policies of labor unions have centred about two main avenues of attack upon the capitalists. Matters of immediate interest, such as wage agreements with employers, are arranged either by peaceful collective bargaining or by more violent action, such as strikes and boycotts. For the more general advancement of the status of the proletariat they rely upon the possibility of obtaining legislation favorable to the interests of the laboring classes. Which of these two policies is most stressed varies with different unions and in different countries, but, on the whole, it is probable that the strike policy has predominated. The degree to which the trade-unions have attempted to gain political power has differed widely with time and nation. In Germany, most unionists are members of the Social Democratic party; in France, orthodox unionists tend to affiliate with the socialists, while the radicals who incline toward "Syndicalism" eschew all political activity; in England, the unionists have a more or less distinct labor party of considerable proportions; in the United States, Samuel Gompers has attempted to keep the American Federation of Labor out of distinct political activity, though he has several times declared his own preference for candidates at Presidential elections. An accessory but very important feature of trade-unionism has been the development of fraternal and co-operative activities among members.

While the growth of organized labor has been one of the outstanding features of the social and economic history of the 19th century it is handicapped by many imperfections. The

attempt to prevent violence through making arbitration of labor disputes compulsory has met with only temporary and local success, most notably in Australasia, though the tendencies seem to be moving in this general direction. Again, many powerful employers and associations of employers have even yet so little adjusted their economic orientation to the modern industrial world that they refuse to recognize the validity of the principles or the practices of labor organizations. As a result, the relations between capital and labor are too frequently of the nature of slightly mitigated industrial warfare. Finally, while there can be little doubt that labor organizations have done more than anything else to advance the material interests of the laboring classes in the last half century and have been the most potent factor in promoting industrial democracy, yet trade-unionism is bound to be unsatisfactory to those who do not believe in merely alleviating the misery of the proletariat, but hope to overthrow the whole modern capitalistic order. Orthodox trade-unionism aims chiefly to improve the lot of the laborer within a capitalistic industrial society, but accepts the implied persistence of this order. Therefore, those who wish the institution of a society controlled by the proletariat and desire to achieve this revolution by economic means rather than by the political methods of socialism have tended to leave trade-unionism and go over to the more radical labor movement which has found its greatest strength in "Syndicalism."

10. The Development of Syndicalism and the Radical Labor Movement.—Syndicalism, which originated as a French labor movement and has since spread to other countries, particularly Italy and America, is the most recent radical proletarian movement of any significant proportions to develop. Syndicalism resembles socialism in desiring to end the present capitalistic economic order; it bears some similarity to trade-unionism in believing that the economic point of attack is most likely to be most effective and in using labor organization as the chief instrument for gathering the forces of the proletariat; it is like anarchism in desiring the abolition of political forms of control over mankind. It differs from socialism in rejecting the efficacy of political activity and in refusing to accept state socialism, even in a proletarian state; it diverges from trade-unionism in favoring, as the unit of organization, the industrial rather than the craft union and in aiming to get rid of the capitalistic employer altogether; and, while bearing a closer relation to anarchism than to socialism, it does not propose so thorough an abolition of all existing institutions as the anarchist desires, and it seems likely to retain a far greater amount of authoritative control over the members of the syndicalist society, even though it may try to evade this in theory by refusing to designate such control as governmental or political.

The historical origins of French syndicalism are not difficult to understand. A vigorous theory of the necessity of a class war had come down from Proudhon. The many factions into which French socialists had split and the bitter animosity which developed between them weakened the cause of the proletariat, and the socialist cause was further discredited

with the radical laboring element because former socialists like Millerand and Briand had been willing, when they entered the French government, to use the forces of the capitalistic state against radical labor revolts. Therefore, there arose a determination among a large number of French labor leaders to turn their back upon all political activity, and to distrust political methods of relief whether from state socialism or Marxian revolutionary hopes. At the close of the "eighties" labor exchanges were organized, first in Paris, and later throughout the leading French cities, to act as a general clearing-house for local labor problems and policies. In 1892 they established a national organization—the Federation of Labor Exchanges (*Fédération des Bourses du Travail*). This movement was guided by Ferdinand Pelloutier (1867–1901), a French disciple of communist anarchism. At about the same time another radical labor organization was developing in France. This was the General Confederation of Labor (*Confédération Générale du Travail*), founded in 1895 by a union of some 700 French local industrial unions or *Syndicats*, from which the syndicalist movement gets its name. In 1902 the Federation of Labor Exchanges and the General Confederation of Labor united and became the basis of the organized syndicalist movement. The systematic theorist of French syndicalism is Georges Sorel (1847–).

The syndicalists eschew any attempt to come to favorable terms with their capitalistic employers in any settlement which may be regarded as permanent. They aim frankly and openly at conducting a class war by industrial methods which will sooner or later drive the capitalist from industry and overthrow his political bulwark—the modern national state. The unit of organization at which the syndicalists aim is the industrial union, the general organization of all laborers in a given industry, which, it is hoped, will give greater strength and less division of interests than craft unionism. Their method of carrying on the class war is the so-called "direct action," the two chief types of which are "sabotage" and the "general strike." The former is more of a temporary instrument designed to serve until the general strike finally drives the capitalist from the field. It consists in every type of harassing the employer, from serious injury to machinery, to slow and inferior workmanship in production. While some employers might be discouraged and abandon the fight merely as the result of sabotage, a more vigorous method will be needed to deal with the more obdurate capitalists and with the state, and for this purpose the syndicalists propose to resort to the general strike, which is not merely a suspension of labor to improve local conditions, but a general "cessation of work, which would place the country in the rigor of death, whose terrible and incalculable consequences would force the government to capitulate at once." Were the syndicalists successful in destroying the capitalistic order they would institute a communistic economic society and a governmental organization based upon the industrial system. As Professor Orth has well expressed it, "syndicalists believe in a local or communal government. Their state is a glorified trade union whose activities are confined to economic functions,

their nation is a collection of federated communal trade societies." They would, then, take government out of the front-door of the state to bring it in by the back-door of industrial regimentation. Of all the radical modern reform movements syndicalism has come the nearest to translating the class war into practical concrete action and it is that form of organization and procedure into which the capitalists should most hesitate to drive the laboring classes. Aside from its own specific program, syndicalism has attracted a sympathetic study from many who are not willing to accept its whole economic program, but feel that something must be done to decentralize the overgrown and unwieldy modern national state and to give representative government a more rational basis, through allowing the representation of economic interests and classes. Further, many exponents of the more orthodox trade-unionism feel that they would gain greatly by giving up the craft union organization and accepting the principles of the industrial union organization. While syndicalism began as distinctly a French movement it has spread into other European countries, notably Italy. In the United States it has been adopted by a considerable group—the Industrial Workers of the World. From the combined influence of France and the United States syndicalism has built up a considerable following in Great Britain.

11. Gild-Socialism as a Compromise between Socialism and Syndicalism.—The movement generally known as gild-socialism means in its essence an economic decentralization and the solution of the labor problem through the revival of industrial associations like the mediæval gilds, adapted to the changed conditions of modern industrialism. Such a proposal dates back to the first half of the 19th century, when it was foreshadowed by some of the propositions of the English Christian Socialists and Ruskin. Especially congenial has gild-socialism been to modern Catholic social reformers, like Bishop Ketteler, Franz Hitze, Count de Mun and Hilaire Belloc. It also has been defended in a modified form by the French sociologist Émile Durkheim, while it has particularly attracted the younger British labor leaders, such as Mr. Cole and his associates. In its modern and elaborated form it aims to effect a reconciliation between state socialism and syndicalism. The political control and administration, which represents society as consumers and which receives the chief attention of the socialists, will be retained by the state. The management of industrial affairs, which pertains to society as producers and is represented by syndicalism, will be turned over to gilds or associations of workmen, properly federated into national organizations. This will give essential industrial autonomy. Above both political and economic authority will be a joint-committee composed of representatives of the state and the gilds, which will have the final decision on disputed points and on those vital matters which concern the citizens as both producers and consumers. To many, gild-socialism seems the most promising of the modern reform policies and a clever synthesis of two of the most powerful of radical reform programs. Others, however, deny the possibility of any real separation of political and industrial functions. As Prof. Ernest Barker has

expressed it, "any doctrine of separation of powers, such as Guild-Socialism advocates, is bound to collapse before the simple fact of the vital interdependence of all the activities of the 'great society' of to-day. Either the State must go, as Syndicalists seem to advocate, and that means chaos, or the State must remain—and then, if you are to have Socialism, it must be State-Socialism."

12. Henry George, the Single Tax and Land Nationalization.—The great majority of radical reform programs in recent times have centred about attacks upon the methods of production and distribution of the earnings in manufacturing industry and commercial enterprises, but these ignored certain sources of modern social problems and evident causes of poverty and misery involved in the unequal and undemocratic methods of landholding. Therefore, it was natural that at least one important reform program should revolve about the proposal to reconstruct the methods of landholding to bring them more into harmony with modern democratic principles. The leader in this movement was a brilliant and energetic American, Henry George (1839-97). Living in California in the early days of its civic and industrial development he was struck with the great increase in land values that took place from purely social causes in less than a decade. Coming to New York the same phenomena attracted his attention in the extreme land values created by social and economic concentration on Manhattan Island. So forcibly was he struck by these facts that he came to regard this increase of real estate values and its absorption by private persons as the chief cause of poverty and misery. Consequently, he proposed, in his notable work on 'Progress and Poverty' (1879), the general abolition of other forms of revenue and the imposition of a so-called "single-tax" on land, which would turn into the public treasury the unearned or social increment in land values. This process would ultimately drive the landlord out of existence and pave the way for the democratic nationalization of land. George's theories attracted the greatest amount of interest in England where the evils he attacked were especially prevalent and where the Liberal party found a modified version of his doctrines a fine instrument to be used in attacking their traditional enemies—the Tory or Conservative landlords. Among his followers was the famous scientist, Alfred Russel Wallace, but it remained for David Lloyd George to give these doctrines some preliminary application in legislation. In the "small holdings Act" of 1907 and in his budget of 1909 he made a definite attack upon the vested landed interests. At the outbreak of the World War he was preparing a radical program of agrarian reform for Great Britain, but the close of the conflict found him detached from the reform party and sitting at the Peace Conference with two of the most tenacious adherents to agrarian autocracy in England, Arthur J. Balfour and Bonar Law. In the meantime the Bolshevik government in Russia had proceeded to carry through a plan of actual land nationalization, but it would seem that this was much more a product of the peculiar aims of the agrarian Socialist, or Social Revolutionary, party in Russia than it was of the direct adoption of the views of Henry George. Most progressive

thinkers differ from Henry George primarily in holding that the single-tax should not be regarded as the sole remedy for modern social problems, though the majority of them would agree that society should in some manner absorb these socially created values known as the unearned increment, and all would give him credit for having called attention to the fact that the capitalistic manufacturer or merchant is not wholly responsible for the evils and misery of the present order. Much of the vitality of the single tax discussion has, however, been subsequently destroyed by changed economic conditions, particularly the relative decrease in the proportional importance of landed as compared with other forms of wealth, and the growing fluidity and legal elusiveness of the present modes of land-holding.

13. Bourgeois Attempts to Absorb the Radical Proletarian Movements.—It could scarcely be supposed that the middle class would sit by and idly contemplate the growth of these threatening proletarian programs and movements without attempting to counteract them—without trying, as one thinker has expressed it, "to set a backfire." Probably the chief instrument which has been used has been state socialism or legislation designed to aid and placate the laboring class, while retaining the essence of the capitalistic system, though it must not be forgotten that much state socialism has been a result of proletarian or landlord attacks upon the middle class. The bourgeoisie have hoped to lead the proletariat to trust to the adequacy of the national capitalistic state as an agent for promoting the cause of social reform and the growth of industrial democracy. Further, the middle class has contributed great donations for social relief work and to aid modern scientific philanthropy, in the hope that such measures will both lessen misery, and hence the pressure for reform, and will attract the gratitude of those who receive aid. Such benefactions have not been made solely for the relief of physical privation and suffering, but even for the intellectual and recreational improvement of the lower classes through libraries, Y. M. C. A. organizations, playgrounds and parks. Then, the more progressive and far-sighted leaders of modern industrialism have developed policies of industrial conciliation designed either to placate the laborers or to get them practically interested in the preservation of the existing order. The best known of such methods are profit-sharing, co-operation, scientific management and industrial welfare work. Some have even gone so far as to foster the growth of conservative trade-unionism, such as is represented by the American Federation of Labor. Of course, many of the modern capitalists still hold tenaciously with strange fatuity to the attitude of John Bright and declare for a war to the end with state socialism and industrial democracy. This group can be trusted to decline with rapidity, or, if they show an unexpected tendency to increase, they may safely be left to the tender mercies of syndicalists and I. W. W.'s. Finally, a philosophy has been evolved designed to effect a liberal compromise between capitalism and labor, which has received its chief elaboration in France where it is generally spoken of as the doctrine of *solidarism*. It takes its origin from the doctrines of Comte, the Positivists and Leroux

regarding the organic unity of human interests. It was further elaborated by the sociologists of the Organicist school and has recently been expanded by Léon Bourgeois from the legal point of view; by Charles Gide from the standpoint of the progressive economist; by Émile Durkheim as a profound sociologist interested in practical social reform; and very recently by the German, Nicolai, from a sociobiological point of approach. This doctrine aims at an honest and thoroughgoing attempt to reform the present order, so as to grant essential economic and social justice to the proletariat while retaining the undoubtedly superior directive and inventive ability of capitalistic enterprise. In its practical program it proposes, on the one hand, an extension of remedial social legislation through state socialism, and, on the other, a great extension of the principle of voluntary co-operation. Its adherents also generally incline toward some considerable decentralization of the administrative powers and functions of the modern national state. Some members of the group lean rather distinctly toward gild-socialism and the representation of economic groups and interests. All in all, it is the one program of reform which embraces the interests of both capitalists and proletariat and which is, at the same time, sufficiently honest, disinterested and progressive to entitle it to respectful consideration.

14. The Great War and Policies of Reconstruction.—The World War at some time in the future will probably be regarded by the historian as having constituted a crisis or a dividing line in the history of modern social reform movements, but it is too early to predict just what the nature of the succeeding reform movement will be. It will doubtless be seen by future historians that back of the struggle of nations was what may have been the beginning of the final struggle between the present social and economic classes—a struggle in which landlord and capitalist united against the common enemy in the proletariat. That the feudal landlord has generally succumbed in the course of the struggle, except in England, is generally conceded. That labor hoped for the equally decisive termination of the modern order of individualistic industrialism is apparent from what is usually taken as the most profound utterance of labor during the war—the report of the sub-committee of the British Labor party on reconstruction. “The individualist system of capitalist production, based on the private ownership and competitive administration of land and capital, with its reckless ‘profiteering’ and wage-slavery; with its glorification of the unhampered struggle for the means of life and its hypocritical pretense of the ‘survival of the fittest’; with the monstrous inequality of circumstances which it produces and the degradation and brutalization, both moral and spiritual, resulting therefrom, may, we hope, indeed have received a death blow. With it must go the political system and ideas in which it naturally found expression.” They expressed the further significant opinion that “what has to be reconstructed after the war is not this or that government department, or this or that piece of social machinery; but society itself.” Further, during the struggle, as a result of the necessity of maintaining the production of necessary munitions at the highest level, ab-

normal concessions had to be made to labor, a situation which did not tend to make the proletariat particularly inclined to acquiesce in any later restoration of the social and economic *status quo ante bellum*. All countries were compelled to undertake what in times of peace would have been regarded as alarming steps toward complete state socialism. In Russia, the feudal autocracy was overthrown and there followed the first attempt in history to apply Marxian socialism to the reconstruction of a great state. In Germany, the fall of the Junker-Krupp alliance paved the way for the triumph of Revisionist socialism in the German political system.

The capitalists did not fail to recognize these various challenges to their very existence as a powerful organized class, nor did they hesitate to take steps to protect their system. Their most effective program was to make patriotism just as far as possible synonymous with rigid adherence to a belief in the sanctity of the capitalistic system and to brand all expressions of proletarian discontent and all plans for radical social reconstruction as products of disloyalty or vile enemy propaganda. Radical leaders were assassinated or sentenced to long terms of imprisonment for criticisms of administrative policy of a much milder character than were passed by unnoticed when uttered by political opponents who were members of capitalistic parties. Severe espionage laws were passed, which were little utilized to aid the military department, but were widely made use of to silence expressions of social and economic discontent. The close of the conflict left a serious situation—a proletariat determined to end an oppressive social and economic order and an organized effort of capitalists to preserve the system to which they owed their economic resources and political prestige. The solution of this problem is what now faces the world with the coming of peace and this solution is bound to be of infinitely greater significance for the history of modern civilization than the redistribution of national boundaries by the Peace Conference. Whether the adjustment will be made in a peaceful manner through a liberal compromise, in which both parties will concede much, or whether it will be made by violence in a bitter class war which cannot but end in the termination of capitalism in a most unfortunate manner, will depend wholly upon the sagacity and statesmanship of those who will lead in the negotiations. What plans of reconstruction will be most used cannot be foreseen. The problem has called forth a reconsideration of every one of the proposals of the 19th century which have been discussed above, not even excepting a return to the complete individualism of the economic liberals.

A final lesson regarding social reform programs has been taught by the World War and that is, as Professor Hobhouse pointed out a number of years ago in his ‘Democracy and Reaction’, that the state is bound to be obstructed in effective programs of social reform as long as militarism menaces our civilization. As long as citizens are bowed beneath the burdens of taxation to supply munitions for active warfare or to support vast armaments for “preparedness,” there will never be adequate funds for thoroughgoing schemes of social reconstruc-

tion. A veritable social and economic paradise throughout the western world could have been created out of the funds expended in this war and in a very real sense the final solution of social problems is bound up with the discovery of some method for discouraging or eliminating war.

Bibliographic Note.—There is no adequate and complete bibliography on this subject, though J. B. Peixotto's 'Syllabus of Social Reform Movements' (University of California Press) and F. G. Peabody's 'A Reader's Guide to Social Ethics and Allied Subjects' contain a large number of classified titles. S. P. Orth's 'Socialism and Democracy in Europe,' pp. 273-279, contains a useful list of books. The bibliographies following chapters xviii and xxi of Volume II of C. J. H. Hayes' 'Political and Social History of Europe,' and the chapters of Parts III and IV of F. A. Ogg's 'Economic Development of Modern Europe' are full and up-to-date.

The clearest political history of modern Europe is C. D. Hazen's 'Europe Since 1815.' The political, economic and social background of modern social reform movements is set forth in C. J. H. Hayes' 'Political and Social History of Modern Europe'; Robinson and Beard's 'Development of Modern Europe'; J. S. Schapiro's 'Modern and Contemporary European History'; F. A. Ogg's 'Economic Development of Modern Europe'; and Max Farrand's 'The Development of the United States.'

The proper intellectual orientation for a study of modern social reform is to be obtained from chapter ix of Volume I of Robinson and Beard, the last chapter of Volume II, and the concluding essay of J. H. Robinson's 'The New History,' on 'The Spirit of Conservatism in the Light of History.' The clearest elementary introductions to the subject are chapter xxi of Volume II of Hayes and the chapter in Schapiro on 'Revolutionary Labor Movements.' The following works would give a fairly complete account of all leading social reform programs: Gide and Rist's 'History of Economic Doctrines'; Ogg's 'Economic Development of Modern Europe'; Bertrand Russell's 'Proposed Roads to Freedom,' Part I; L. H. Haney's 'History of Economic Thought'; S. P. Orth's 'Socialism and Democracy in Europe'; E. Barker's 'Political Thought in England from Spencer to the Present Day'; and F. S. Marvin's 'The Century of Hope.' The third volume of Professor Dunning's 'History of Political Theories' is in preparation.

The chief social reform programs down to the Industrial Revolution are to be found in W. W. Willoughby's 'Political Theories of the Ancient World'; W. A. Dunning's 'History of Political Theories,' Volumes I and II; James Bonar's 'Philosophy and Political Economy'; M. Beer, 'The History of English Socialism'; W. B. Guthrie's 'Socialism Before the French Revolution'; and J. B. Peixotto's 'The French Revolution and Modern Socialism.' The economic and social background of post-Industrial Revolution reform can be found in J. A. Hobson's 'Evolution of Modern Capitalism' and J. L. and B. Hammond's 'The Village Labourer'; 'The Town Labourer.' On economic liberalism and utilitarianism good introductory treatments are to be found in Gide and Rist, Haney and W. L. Davidson, 'Political Thought in England:

the Utilitarians.' On the economist's opposition to economic liberalism one should consult Haney and Gide and Rist; on the rise of Tory Socialism in England, Gibbins, H. D. B., 'The English Social Reformers' and Hutchins and Harrison, 'The History of Factory Legislation'; on Christian Socialism, Flint, R., 'The Philosophy of History in France'; Gibbins, and Seligman, E. R. A., 'Owen and the Christian Socialists,' in the 'Political Science Quarterly,' Volume I; on the literary and æsthetic revolt, Barker, chapter vii; on the utopian movement, Gide and Rist, Kirkup, T., 'History of Socialism'; Noyes, J. H., 'American Socialisms'; and Hinds, W. A., 'American Communities'; on transitional socialism, Gide and Rist, Kirkup and Mariott, J. A. R., 'The French Revolution of 1848 in Its Economic Aspects'; on the rise of modern anarchism, Brailsford, H. N., 'Shelly, Godwin and Their Circle'; and Zenker, E. V., 'Anarchism'; and on the political revolutions of 1848, Andrews, C. M., 'Historical Development of Modern Europe,' Volume I, chapters ix, x.

The nature of the German theory of the state is indicated in chapters i-iii of Barker and in John Dewey's 'German Philosophy and Politics.' The development of sociology is sketched in A. W. Small's 'General Sociology' and L. M. Bristol's 'Social Adaptation.' Marxian socialism is set forth in Spargo and Arner's 'Elements of Socialism'; Gide and Rist; Kirkup; Russell, chapter i; and K. Kautsky's 'The Social Revolution'; it is criticized by W. Sombarth, 'Socialism and the Social Movement'; and Skelton, O. D., 'Socialism, a Critical Analysis.' The Fabian movement and revisionism are discussed by Edward Pease, 'The History of the Fabian Society'; and by E. Bernstein, 'Evolutionary Socialism.' State socialism is described by Ogg in Part III of his work; and in Hayes, 'British Social Politics.' Recent Christian Socialism is dealt with in F. S. Nitti's 'Catholic Socialism'; C. D. Plater's 'Catholic Social Work in Germany'; Cunningham, W., 'Christianity and Social Questions' and 'Christianity and Politics'; Figgis, J. N., 'Churches in the Modern State.' Recent anarchism is dealt with by Russell, chapter ii; by Zenker and by Eltzbacher, P., 'Anarchism.' Trades-unionism is well discussed in Webb, S., 'History of Trade Unionism' and in Orth. Syndicalism is analyzed by Russell, chapter iii, and by Levine, L., 'The Revolutionary Labor Movement in France' and Brissenden, P. F., 'The I. W. W.: A Study in American Syndicalism'. Guild-socialism is treated by Cole, G. H. D., 'The World of Labor' and 'Labor in Wartime' and by Reckitt, M. B., 'The Meaning of National Guilds.' For the single tax program consult Henry George's 'Progress and Poverty' directly. Solidarism is analyzed by Gide and Rist. The problems of reconstruction are classified by Lindsey Rogers, 'The Problems of Reconstruction.' The problems connected with the ending of war are summarized in Duggan, S. P., 'The League of Nations: The Principle and the Practice.' From these introductory discussions the student will turn to the detailed monographs and the sources, many of which are mentioned in the bibliographies in Peixotto, Hayes, Ogg and Orth.

HARRY ELMER BARNES,

Professor of History, New School for Social Research, New York City.

SOCIAL SCIENCE, the science that deals with the social condition, the relation and institutions which are involved in man's existence and his well-being as a member of an organized community. It concerns itself more especially with questions relating to public health, education, labor, punishment of crime, reformation of criminals, pauperism and the like. Its history is traced in the most ancient of human records, in the sacred books and laws of Babylonia, Egypt, Judea and Greece. The universal concepts of modern social science as developed by Comte (q.v.), are found in Plato's 'Republic' and 'Laws'; in Aristotle's 'Politics'. It involves gathering of statistics, classifying them and drawing deductions, especially as to the larger question involved. It thus deals with the effect of existing social forces and their result on the general well-being of the community, without directly discussing or expounding the theories or examining the problems of sociology, of which it may be considered a branch. Its study is being taken up in schools for social workers, several of which have received grants from the Sage Foundation. Consult 'American Labor Year Book,' published by the Rand School of Social Science.

SOCIAL SCIENCE ASSOCIATION, American. A society organized for study and research in social problems, founded at Boston in 1865. Annual meetings are held in cities selected at the last preceding meeting. The work of the association is divided into five branches or especial fields as follows: Community health, education and art, social economy, finance and jurisprudence. The association has a membership of about 1,100, including the most eminent sociologists of America and other countries. Its official organ is the *Journal of Social Science*, published annually.

SOCIAL SCIENCE, National Association for the Promotion of, The (British), an organization founded in 1857 for the purpose of study and research in all matters of social service and industrial betterment. In 1864 it absorbed the Association for Promoting the Amendment of the Law. Yearly migratory meetings are held and transactions published. The society has greatly enlarged its scope from its foundation and now seeks to promote in Britain the initiation and development of the most beneficial and successful forms of social service.

SOCIAL SERVICE, the modern study of people and conditions looking toward the betterment of mankind; a forward movement dealing with life, occupations and environments, embracing the observation and investigation of the relations between employers and employees, co-operation, labor legislation, hours of work, wages, industrial betterment, child labor, factory sanitation and inspection, safety appliances, improvement of civic and municipal conditions, civil service, public ownership, the initiative and referendum, tax reform, marriage and divorce, housing, temperance, pauperism and crime, defective and delinquent children, education, social settlements, institutional churches and the like.

Social Revolutions.—During the 19th cen-

tury there took place the two greatest revolutions in all history—one in the material world, created by the application of natural forces to industry; the other in the world of ideas, produced by the application of the scientific method to all processes of investigation. They have radically changed very many social conditions. Thousands of mechanics have lost their positions in recent years because they could not readjust themselves to the new methods of invention. Thousands of business men and manufacturers have been driven into bankruptcy because they could not adapt themselves to the new conditions by more economical methods of production and distribution. Many tens of thousands of men, women and children die needlessly in our cities every year because we have not yet learned how to adapt ourselves to the new conditions of urban life.

The process of readjustment is one of experiment. Each experiment, whether successful or otherwise, throws a ray of light on the problem of how to do it or how not to do it. Experience signifies nothing unless we trace the relations of cause and effect. The science of statistics, by which facts are so gathered as to embody truth and so interpreted as to afford knowledge, is of recent origin. It is a singular fact that our young republic was the first government in the world to take a census at stated intervals. Ships of state kept no log-books. It is small wonder that so many split on the same rocks. Important as it is in social and political science to know precisely where we are, it is even more important to know the direction in which we are moving, for tendency is prophetic, and to establish a line of tendency we must fix more than one point; hence the value of a base line. Our decennial census during the 19th century established a base line 100 years long—the first in all history—from which we may measure in the 20th and in each succeeding century. Only in recent years have men learned to gather facts, to sift them and correctly to interpret them, thus creating science. We are only beginning to construct the science of living, which is living in intelligent obedience to all natural laws; that is, all the laws which God has established both for the individual and for society.

Existing Evils.—There are many great evils incident to our present stage of industrial and social evolution on which no intelligent lover of his country and his kind can look with indifference. The widespread hostility, if not open conflict, between organized capital and organized labor does violence to economic and social laws no less than to Christian principles. The reckless and increasing sacrifice of life and limb in American industry calls for such education of public opinion as will demand and enforce effective legislation touching accidents and their prevention. The victories of peace are even more bloody than those of war. There were not so many victims of the Boer War as there were in American industries during the same period. If to casualties on railroads we could add those in the mining, manufacturing, building and lumber industries, the totals would show a very considerable industrial army killed and a very large industrial army wounded every year.

Our Western industrial progress is attended by considerable evils. It redistributes popula-

tions, compacting masses in the city, creating the tenement-house with its long list of evils, complicating the problems of sanitation and raising the death rate. It assumes the rôle of Herod and slaughters the innocents, while the children who escape from the factory with their lives are commonly pinched and deformed in body and mind. It creates the popular discontent which inevitably springs from the multiplication and popularization of knowledge together with the multiplication and concentration of wealth. It is attended by the organization of capital and labor which are arrayed against each other in hostile camps. Now many of these evils are entirely preventable, though certain to be developed if neglected. They were permitted to fasten themselves on western Europe and the United States because they were not foreseen. That excuse does not exist for the remainder of the world. With the close of the World War and release of shipping, northern capital, population and energy will flow into South America and inaugurate there an industrial revolution. It is already well under way in Russia and Japan and is now beginning in China and India. Unless prevented by intelligent foresight, the evils which have thus far attended the industrial revolution will accompany it round the world and involve the hundreds of millions of these countries in sufferings as measureless as they will be needless. These peoples are credited with less power of self-restraint than the peoples of Europe and North America and yet we are in a World War, based on a desire for industrial supremacy. We are, therefore, bound by every obligation of humanity and religion to safeguard them with our experience and thus forestall preventable evils, which if not thus prevented will be far more disastrous in the Orient than they have been in the Occident.

Many organizations exist for improving conditions in large cities. These organizations need to know each others' methods and to work together. To that end, a National Community Centre Conference is now held annually in the United States, the 1917 gathering in April being attended by delegates from 26 cities.

The Musée Social.—The section of Social Economy in the Paris Exposition of 1889 was peculiarly rich in documents relating to the conditions of labor and to workingmen's institutions. This exhibit made permanent was the origin of the Musée Social. Endowed with adequate funds, it is devoted solely to the promotion of the study of labor problems and the advancement of concrete measures of labor reform. As regards its organization and purpose it exemplifies in the field of economic research very much what the Smithsonian Institution in Washington does in the domain of scientific investigation. Both were founded by private individuals "for the diffusion of knowledge among mankind." Both are non-scholastic in the sense of having no regular classes of students and both maintain a corps of experts devoted to original research and to the aid of those making similar inquiries. The Musée constitutes a veritable laboratory for economic research in all fields as far as they relate to concrete labor problems. In the language of its constitution, its object is "to place gratuitously at the disposition of the public documents with collateral information, constitutions

and models of institutions and undertakings having for their aim the improvement of the moral and material situation of the laboring classes." To carry out this aim the Musée has spared neither pains nor expense in the organization of every possible means of obtaining information concerning labor and labor conditions in all lands and in facilitating its use by all those interested in matters of social reform. It is well installed in a building owned by it at 5 Rue Las Cases, where it has lecture-rooms, meeting-rooms for the economic and reform societies of Paris, exhibition-rooms for the display of plans, models and accident-preventing appliances and its carefully selected library. This includes over 15,000 volumes exclusively devoted to labor and consisting largely of original sources of information, reports and proceedings of societies and social undertakings which are not to be found in ordinary libraries. Its files include records and copies of labor legislation in all countries and of important labor events, catalogued and under the direction of skilled librarians, whose duty it is to help investigators desiring to make use of such material. The Musée, however, is not content with bringing together the results of others' efforts. Each year it sends one or more commissions to investigate particular features of the labor problem in foreign countries. It has thus made detailed investigations of trade unions in Great Britain, labor organizations in the United States, co-operative and credit institutions in Italy and the agrarian question in Germany by special delegates sent to those countries. In addition to making these special inquiries, it maintains in foreign countries special correspondents whose duties are to supply the Musée with copies of all bills, reports or laws concerning labor matters presented in their respective countries or of privately published works concerning labor, to furnish information as called for and to transmit annual reports giving a résumé, with documents, of the labor events, legislation and judicial decisions relating to labor during the year. See SOCIAL AND UNIVERSITY SETTLEMENTS.

SOCIAL SERVICE, American Institute of. The League for Social Service of New York City was organized in New York in 1898 by Josiah Strong and William H. Tolman, who became its president and secretary, respectively. The League, reorganized, enlarged and incorporated, became known in 1902 as the American Institute of Social Service, with headquarters at 287 Fourth avenue, New York. The three functions of the Institute are: (1) To gather from all possible sources facts of every kind which bear on social and industrial betterment. (2) To interpret these facts by ascertaining their causes and effects, thus gaining their real significance and (3) to disseminate the resulting knowledge for the education of public opinion, with an educational charter from the Regents of the University of the State of New York.

The work of the Institute is divided into 11 departments: (1) Bureau of Information; (2) Investigation; (3) Illustration; (4) Publication; (5) Legislation; (6) Lecture Bureau; (7) Library and Archives; (8) Museum of Security; (9) Personal Study and Research;

(10) International Relations; (11) Relations with other Societies.

The American Institute of Social Service is collecting a great mass of facts from Europe, as well as America, which embody experiences of many millions of people, and these facts scientifically interpreted throw light on many social problems, new and old, and afford practical guidance in the conduct of life and in the establishment of right relations between man and man. In response to inquiries, the Institute's bureau of information is constantly sending materials bearing on social and industrial betterment to newspaper men, ministers, students, teachers, authors, legislators and the like. When a corporation desires to improve the condition of its employees, the Institute can furnish facts and photographs showing what is being done along these lines by many of the world's great captains of industry, such as Casimir-Perier of France, Van Marken of Holland, Cadbury of Birmingham and Lever of Liverpool, describing their improved housing, their sanitation, their hospitals, homes for convalescents, schools, kindergartens, athletic grounds, parks, baths, swimming pools, systems of insurance, old-age pensions and the like. Again, a city desires to improve its municipal housekeeping and would like to learn from Glasgow as a model. It is not necessary for Cincinnati or Chicago to send a committee of investigation to the Scotch metropolis. The Institute can send Glasgow to Cincinnati or Chicago and by means of hundreds of lantern slides show her improved tenements, her street-cleaning system, her playgrounds, her out-door gymnasia, her hospitals, her park system, etc. A church which is struggling to adapt itself to a changed environment wishes to know how certain problems have been solved. The Institute can give information of scores of churches which have successfully adjusted themselves to new conditions and whose experience will probably afford the desired solution. The existence of all the States with their separate legislatures affords a vast field for social service by helping all to profit by the experience of each. Most of the great problems of all the States are substantially the same, as in the case of pauperism, crime, defective and delinquent children, the relation of labor and capital and the like. Some States are much in advance in one particular, others in another. What if, in each particular, all the States could be brought up to the standard of the most advanced State; how would the nation leap forward in civilization? For instance, the experience of several States has demonstrated the value of juvenile courts and of industrial legislation for children. In the natural course of things it takes years for such reforms to reach the more backward States; whereas the Institute, with the necessary funds, could doubtless educate public opinion so as to secure the desired legislation in one-quarter of the time. As President Roosevelt says in a letter to the Institute: "The possibilities of the Institute are well nigh boundless. It is apparently proving to be the beginning of a world movement, and is being recognized by the best men of many different countries as a necessity in each and all of these countries in order to facilitate a readjustment of social relations to

the new conditions created by the modern industrial revolution."

In 1903, Andrew Carnegie (q.v.), the philanthropist, placed in trust the sum of \$2,500,000 for the purpose of beautifying and improving his native town of Dunfermline, Scotland, and the American Institute of Social Service outlined a plan of procedure for this important work. The plan included a regional museum, a district for a "city beautiful," a social centre, a department of civics, boys' and girls' flower gardens, children's playgrounds and out-door gymnasia, holiday tours and historic pilgrimages, "get-together club" and a system of awards and prizes. The general outline for a city beautiful suggests that somewhere in the confines of the park land should be set aside on which can be built model dwellings of diversified architecture. One house should be set aside as a working model, furnished throughout with all necessities and as many comforts as are demanded by a modest taste. By means of this model house, clerks, artisans and laborers may be shown how to furnish their homes. Under this plan the social centre should be a building located in the park, easily accessible, so as to be a resort for all the people—children for the most part by day, adults at night and on holidays. It should contain a hall for music, speaking, dancing, flower shows and other entertainments. There should be classrooms for instruction in music and art in its various branches. In a regional museum should be collected the various processes of local industries, in order that the individual workman may get an idea how his part in the process is related to the great industry as a whole. The department of civics is intended to inspire youth and to direct their enthusiasm wisely, so as to raise the tone of their citizenship. Consult Ogburn, W. F., 'Wages in American Cities' (1917); Calhoun, A. W., 'Social History of the American Family' (1917).

SOCIAL SETTLEMENTS. See SOCIAL AND UNIVERSITY SETTLEMENTS.

SOCIAL AND UNIVERSITY SETTLEMENTS. Social service is the modern study of people and conditions looking toward the betterment of mankind; a forward movement dealing with life, occupation and environments, embracing the observation and investigation of the relations between employers and employees, co-operation, labor legislation, hours of work, wages, industrial betterment, child labor, factory sanitation and inspection, safety appliances, improvement of civic and municipal conditions, civil service, public ownership, the initiative and referendum, tax reform, marriage and divorce, housing, temperance, pauperism and crime, defective and delinquent children, education, institutional churches and the like. The houses or buildings whence all these activities are directed are known as social settlements and the fact that university men were and are prominent in the movement has caused them to be known frequently as university settlements.

The necessity for systematized social service was impressed originally upon the minds of Englishmen, due to the enormous increase in the indigent and submerged class in London and in other large cities of Great Britain, which became apparent soon after the great expansion of the factory system there in the first half of

the 19th century. It was realized that useful aid along a variety of lines could be best given by men and women actually living among the poor and studying the difficulties besetting them. Among the prominent leaders of the movement in England were Arnold Toynbee, Charles Kingsley, John Ruskin, Thomas Hughes, Dickens, Carlyle, Thomas Arnold, Thomas Hill Green and Edward Dennison. A growing sense of social duty and responsibility actuated these men in calling attention to the many social evils of their period. In 1864 Dennison went to London to live in a poor quarter of the East End. In 1871 Arnold Toynbee gave several addresses before the workmen's organizations in London and in the provinces. He died in 1883 while still in early manhood. It was Toynbee's spirit and ideas more than any work which he individually accomplished that gave to the settlement movement its chief characteristics and its abiding sense of social obligation. The work as taken up by Canon Barnett and others imbued with Toynbee's spirit assumed three general forms: (1) Relief through charity and medical attendance; (2) the providing of opportunities of a social and recreative character; (3) the establishment of educational centres for purposes of primary or advanced instruction, including certain phases of culture. In 1860 F. D. Morris established the Workingman's College in London. In 1867 Cambridge University started its first University Extension scheme. Following this, in 1869, the Charity Organization Society was founded; in 1885 Toynbee Hall was opened by Barnett in East London and in 1887 the Neighborhood Guild, later the University Settlement, was opened in New York City. These initiatory steps were followed by others of a closely allied character in all large cities where the density of population is sufficient to indicate the need for social service.

The dominant idea in settlement work is that of teaching wage-earners to help themselves. The goal sought is individual development stimulated into being under the guidance of teachers. The element to be eliminated in all these efforts is that of patronage. Social service in the nature of direct gifts of food, fuel, clothing or money must be extended with great discrimination, lest chronic pauperism be encouraged and the already too large class of parasites on the charitable world be increased. In all phases of the work, tact and judgment are required, but these are particularly requisite in dealing with those cases where pride prevents an advertisement of need or forbids the acceptance of unsolicited help. Persons possessed of these qualities and who are capable of advising and preventing the development of acute conditions in particular cases are of the greatest value in settlement work.

Nature of Settlement Activities.—The work at a centre is laid out into six classes: (1) care of infants; (2) courses for children from six to 14 years of age; (3) course for boys and girls between 14 and 18 years; (4) a course for women of more than 18 years; (5) a course for men of 18 years and upward; and (6) general courses of an advanced nature. In connection with talks to mothers, ocular demonstrations of the best care of infants and young children are given. Children fit for

kindergarten work receive the benefit of æsthetic culture through colored paper work, music, songs, parties, games, plays, etc. The older children of from six to 14, through physical culture classes, are given opportunities for improving their general health; they are formed into clubs for the purpose of developing administrative ideals, and encouraging self-help. Their work consists of drawing, sewing, mending, wood-carving, cooking, nature study, musical classes, chorus work, including entertainments, art exhibits, summer outings, picnics, winter socials and receptions. A late development is the teaching of dancing, which is found to be a most admirable means for the development of grace of body and the power of acting in concert. Those of 18 years and upward follow a scheme which includes the preservation of health, study and training along technical lines, forms of instruction in classes, lectures, concerts, and various aids to culture, sociability and political breadth of mind. The idea running current through all these courses, designed as they are to meet the requirements of the child, the youth and the adult, is that of inculcating the value of physical health, wage-earning and other concomitants of economic welfare, general instruction, an insight into the meaning of æsthetic culture, the value of functions which increase sociability, the advantages of clubs and discussions for the purpose of gaining political and other co-operation, and other means of creating a sense of "community interest" and good citizenship.

Social Service to the Immigrant.—While in the older nations the class among which these activities are exercised is made up of natives, the "submerged tenth" of London, for instance; in America, it is the new-comer, the first generation of the immigrant horde and its children, that call for the labor of the social service workers, and the work required is the adjustment of the lives of these people to their new environment, and especially in giving to the older ones a sense of nationality and citizenship and a knowledge of the power this gives them. When they fully realize that they can, if they will, choose representatives to properly present their needs, an immense gain is made, and the feeling of class against class, and a belief in dominance of wealth in the government, ideas only too prevalent and not wholly without foundation, will be in a fair way of disappearing. To awaken within the immigrant a consciousness of his power is a moral, as well as an economic necessity, for social demoralization disappears before healthy mental activity.

The religious question is delicate only when misunderstandings arise; if the expressed object of a centre is to impart religious or ethical principles, a frank acknowledgment is proper. Some settlements operate along definite denominational lines, so that no misapprehension arise even when proselyting results. Ambiguity in this respect is an injury to the cause.

Administration of Settlements.—A head-worker is the chief of a staff of assistants which are divided into two classes; the first and most important class are the resident workers. The second class are non-resident workers. The head-worker's duty is that of giving intelligent advice to his assistants, when

they are in doubt as to what course to pursue. The workers in all cases are allowed considerable latitude as to ways and means of obtaining practical results, but no effort must be spared to avoid friction and to produce an absolute harmony in all parts of the work.

For the proper administration of activities centred in a settlement, money must be forthcoming; though the city itself is the direct benefactor, it is never the main contributor. The workers must be sufficiently well paid to enable them to live decently while devoting their time to the work. To the non-resident workers no remuneration is given. It is then a necessary part of the work to secure money when there is not a regular income provided by endowment or contributions. As far as possible the idea of self-support is advanced in all phases of settlement work. The head-worker and his assistants plan along economic as well as cultural lines. A head-worker of strong personality and broad mentality with experience and judgment is necessary as supervisor and manager. Diplomacy is a great requisite, particularly in the encouragement of those willing to sacrifice time and labor for humanity's sake, as resident or non-resident workers.

Development of the Settlement Idea.—From Toynbee Hall in 1885 the settlement idea spread out through the larger centres of population in England until to-day there are about 50 such in the country. In America the Neighborhood Guild of New York was followed soon after by the "College Settlement" and in 1889 Chicago saw the establishment of Hull House, the greatest American settlement. In America there are at present over 100 settlements doing excellent work in the congested areas of the large cities. The *Université Populaire* and the *Œuvre de Popincourt* in Paris are similar in their educational work to the university settlements. The *Ouis Huis* of Amsterdam, Holland, is also similar. There is a missionary settlement in Bombay, the "House of Neighborly Love" in Kyoto, Japan, and Kingsley Hall and a French missionary settlement in Tokio. The movement has spread to Australia, the Toynbee Guild at Sydney being founded by an Oxford man. In America and to a greater extent elsewhere social settlement work can ever be but a palliative in that the fundamental causes of poverty, low wages, etc., are left untouched by the movement. Young college men and women of humanitarian views spend a few years in the work after graduation but leave it for a real career just when their experience would render them valuable aides in the work. By some it is used as a means to acquire the necessary experience in order to qualify for a position in the correctional or charitable administration of the State. The recent campaign for Americanization in the United States takes up the work of the social settlement as far as regards the preparation of the foreigner within our shores for citizenship. Even here the motive has not been entirely altruistic nor patriotic but rather the effect of conservatives to stave off the introduction of governmental principles which to them seem subversive of the present order. A campaign to teach common honesty and fair dealing in the affairs of life especially among

our men of wealth is more needed in America to-day than any campaign against radical movements, which can never gain a real foothold in our democratic system.

SOCIAL WAR (Lat. *Bellum Sociale*), or **MARSIC WAR**, a war waged in 90-88 B.C. between Rome and her allies of southern and central Italy, including the Marsi, Peligini, Samnites and Lucanians, precipitated by Rome's refusal to extend to them the privileges of Roman citizenship. A new Italian republic was established with its capital at Corfinium and its leaders waged successful war against the Roman forces under the generals Marius and Sulla. Rome, however, encompassed the fall of the republic by granting the formerly withheld rights as citizens in return for allegiance to the empire. In Greek history there were two Social Wars. (1) In 357 or 358 to 355 B.C. between Athens and her former allies, Cos, Chios, Rhodes and Byzantium. Athens suffered defeat. (2) In 220-217 B.C. between the Achæan and Aetolian leagues.

SOCIALISM is a word having two distinct but related meanings: primarily it is used as the name of a certain philosophy of history and method of interpreting and analyzing social phenomena. In the second place, since this philosophy and method have as one of their principal conclusions that society is evolving toward a co-operative social stage, the word is used to designate a co-operative social organization where the means for the production and distribution of wealth are the collective property of the working class, while the goods which are to be consumed become the private property of the individual workers. The philosophy of Socialism, as generally accepted by the socialist parties of the world at the present time, takes as its fundamental hypothesis what has been variously called the materialistic interpretation of history, historic materialism, or economic determinism. This doctrine is stated as follows in the introduction to the 'Communist Manifesto':

"In every historical epoch the prevailing mode of economic production and exchange, and the social organization necessarily following from it, form the basis upon which is built up, and from which alone can be explained, the political

and intellectual history of that epoch; and consequently the whole history of mankind since the dissolution of primitive tribal society, holding land in common ownership, has been a history of class struggles, contests between exploiting and exploited, ruling and oppressed classes; the history of these class struggles forms a series of evolution; now-a-days, a stage has been reached where the exploited and oppressed class — the proletariat — cannot attain its emancipation from the sway of the exploiting and ruling class — the bourgeoisie — without at the same time, and once and for all, emancipating society at large from all exploitation, oppression, class-distinctions, and class-struggles."

It is maintained that the form in which production is carried on in any society constitutes the fundamental fact which determines all other social institutions. This does not hold that each economic era begins *tabula rasa* in the field of institutions. Each historical stage inherits its institutions from the previous stage and it can influence, change and reconstruct these or establish new ones alongside of them. These inherited characteristics include customs, laws, ethical standards, public opinion, and in short the whole set of institutions and social psychology which has been built up throughout the course of human evolution. The analogy between heredity and environment in biology and in the social organism is here very close. Since the appearance of the institution of private property in the instruments by which wealth is produced and distributed, society has necessarily been divided into two classes according as their members own or do not own these essential for the production of wealth. The struggle of these classes for power constitutes a large portion of the history of modern times. In the Middle Ages, land being the most essential instrument for the production of wealth, the landlords were the ruling class and social institutions were determined by them in accordance with their interests. When the great transformation of hand tools into factory machinery took place at the close of the 18th and beginning of the 19th century, this machinery of the modern factory became the most essential element in the production of wealth, and its owners became the ruling class.

When the owners of industrial capital had gained their victory they set about establishing a society in accordance with their interests. They formed at this time the class most necessary to the basic industrial processes of society, since the accumulation and organization of capital was the most essential thing at this historical period. Later on the capitalist class laid down its function as organizer and director of industry and became simply a share-holding class. Hired wage-workers, including manual laborers, overseers, bosses and superintendents perform all the essential social processes. The capitalist class having handed over its function to the working class, the latter becomes not only the most essential, but the only essential class. The material interests of this class involve it in continuous struggles with the capitalists. Sooner or later this struggle is transferred to the political field where the laboring class is represented by the Socialist party, having as its object the capture of the powers of government and social control in order that it may use them in the interest of that class.

According to this philosophy the social dynamic which compels advance is the continuous improvement of the processes of production. Every new invention and every improvement in the organization of industry starts in motion a

series of influences which do not cease until they have reached and affected every institution within the society of which they form the industrial basis. During the last 100 years mechanical improvements have multiplied many fold the productive power of each individual worker. But the army of unemployed prevent the price of labor power as a whole from rising much above the point necessary to maintain the efficiency of the wage-worker as a producer. Consequently the workers who use these improved instruments receive but a small fraction of the greatly multiplied product. They have no choice under the present system but to accept these conditions. While production is for sale in the competitive market only the cheapest can continue to produce. If the workers are to produce, and they cannot live without producing, since they have no power of ownership to take from other producers, they must gain access to these highly perfected tools. Hence they compete with one another for the privilege of using them, and of selling their labor-power to the owners of the tools. They finally accept a wage-contract by which, for the privilege of producing their own wages during the first hour or two of work, they continue at work for many hours more, producing surplus value for the owner of the means of production which they use.

Improvements in production often take other than mechanical forms. The modern trust is, to some extent, to be considered as such an improvement. Socialist writers pointed out over a half century ago the self-destructive character of competition. It was then foreseen that one of the inherent characteristics of large industry was its greater economy as compared with smaller competitors. Consequently the large industry tended to eliminate all smaller competitors within the circle of its market. Improvements in transportation, communication and storage rapidly extended the circle of the market to national, and for some products, at least, to international dimensions. When, however, there are sufficient plants constructed to more than supply any circle of the market and competition is reduced to a few industrial units, the wastes of competition and the destructiveness of competitive war become so evident that combination is inevitable. The result is some one of the various forms of combination by which competition is stifled and monopoly established.

The wage-workers seek political victory in order that they may impress their interests upon the social organism and thereby remove the evils under which they suffer at the present time. Since most of the evils of which they complain spring from the fact that they are debarred from access to natural resources and the instruments for the production and distribution of wealth, their first demand is that such access be freely granted. But free access implies legal ownership and with modern concentrated complex industry this ownership cannot be individual unless all the evils of the present system are retained. Hence, we have a demand for collective ownership.

Thus Socialism as a philosophy is mainly an analysis of capitalism. As an ideal, as a social stage, it presupposes the capitalist system, since that can alone prepare the way for Socialism.

This future system, or ideal, is in no sense of the word a scheme whose adoption is asked for by the Socialists. It is simply the next logical stage in social evolution. Socialists do not attempt, therefore, to give any details of that future society since all such details will be dependent upon the decision of a majority of the working class of that future time, and upon the stage of industrial development which has been attained when Socialism is ushered in. Since both of these factors are manifestly impossible of being known at the present time, any attempt to forecast their outcome would be equally impossible. All that can be said is that present tendencies of social development show what must be a few of the general features of the next social stage.

Socialists maintain that the coming society will be preferable to the present one, especially for the working class. With a collective democratically managed organization of industry, in which natural resources and the mechanical means for the production and distribution of wealth have their ownership vested in society, and where production is for the direct use of the producers and not for sale, the wastes of the present system will be largely abolished. Among these wastes which will be abolished are advertising, duplication of plants and power, poor utilization of mechanical progress, disadvantageous geographical location of industries, etc. Some of these are already being abolished by the trust method of production. But at the present time the saving accomplished redounds almost wholly to the benefit of the few owners of the trustified industry. In addition to this, Socialists maintain that much greater savings would be made under Socialism by the utilization in productive labor of the energies of whole classes of the population from whose strength and ability society, at present, derives little or no advantage. This would be true, for example, not alone of the present army of the unemployed amounting in the United States to between 1,000,000 and 3,000,000, according to industrial conditions, but also the purely capitalist class whose functions of ownership being performed collectively would enable the members of that class to directly assist in production. By far the larger share of that portion of the population concerned in the protection of individual property rights in what Socialism would make collective property, such as lawyers, judges, police, private watchmen, detectives and the army and navy, could also be changed into productive workers.

Socialists also claim that in a co-operative society the sum total of human happiness would be immensely increased by making the production of goods in itself pleasurable. When profit and the competitive struggle are abolished and productive energies fully utilized there will be a possibility of that leisurely artistic creative activity, which modern psychology and pedagogy agree is capable of furnishing the most intense pleasure and valuable educational training to the individual worker while, at the same time, producing the best possible goods for the satisfaction of human needs. It is this phase of Socialism which has always attracted artists and has given rise to the now extensive arts and crafts movement. It is easy to see in this connection that Socialism would offer a much greater field

for the development of individuality than is possible for the great mass of the people to-day.

The theory of Socialism is itself a product of evolution, the ideal appearing long before the philosophy of society and the scientific analysis of social relations which make possible the realization of that ideal were worked out. Ever since the days of Plato, and especially since the writing of Sir Thomas More's 'Utopia,' men have dreamed of a society which should be a co-operative brotherhood. During the latter part of the 18th and first half of the 19th century, utopian Socialism reached a high degree of development and found numerous illustrious followers. Among these were Fourier, Babeuf, Saint Simon and Cabet in Europe, and a few years later, Greeley, Dana and Nathaniel Hawthorne in America. Robert Owen marked somewhat of an advance on this position. While he founded colonies and pictured utopias, he also set forth many ideas that have since become a part of modern scientific socialism. Lassalle, Rodbertus and Weitling in Germany, Colins and De Paepe in Belgium also helped to some degree to formulate present socialist philosophy while they also partook of a Utopian character. It is with the work of Karl Marx (q.v.) and Friedrich Engels (q.v.), however, that modern Socialism began definitely to take on the forms by which it is known to-day. In 1845 Marx was ordered out of Paris and went to Brussels where he was joined by Engels and where they founded the "German Working-Men's Association" with the *Deutsche Brüsseler Zeitung* as its organ. It was while here that they became members of the Communist League and wrote the 'Communist Manifesto,' to which reference was previously made.

A philosophical and a political goal presupposes an organization for propaganda and political activity. The body that is generally looked upon as the ancestor of the present world-wide Socialist organizations is "The League of the Just," organized in Paris in 1836. The aims of this organization were, however, very indefinite, and its principal significance lies in its transformation in 1847 into the "Communist League." This change was brought about through the influence of Marx and Engels. While the "Communist League" exercised considerable influence on Continental labor movements during the first two or three years of its existence, yet it was overwhelmed in the reaction which followed the revolutions of 1848, and by 1853 it had practically disappeared. Its great contribution to Socialism lies in the fact that under its auspices was issued a document that for far-reaching consequences and lasting influence must be considered one of the most remarkable ever written. This was the 'Communist Manifesto' drawn up by Marx and Engels as a committee of the Communist League in 1848. This work consists of a summary of the philosophy of Socialism and has been translated into almost every known language, and still constitutes the most generally circulated work on Socialism in existence. New editions and translations appear continually throughout the world. The next great step was the organization of the International Working-Men's Association (q.v.) at Saint Martin's Hall, London, 8 Sept. 1864. A committee appointed at

this meeting and composed of 50 members representing six nationalities presented a declaration of principles which was written by Karl Marx and which was unanimously accepted by the organization. Since this declaration has formed the basis of almost countless socialist platforms in different countries since that time it is worth reproduction:

"In consideration that the emancipation of the working class must be accomplished by the working class itself, that the struggle for the emancipation of the working class does not signify a struggle for class privileges and monopolies, but for equal rights and duties, and the abolition of class rule;

That the economic dependence of the working man upon the owner of the tools of production, the sources of life, forms the basis of every kind of servitude, of social misery, of spiritual degradation, and political dependence;

That, therefore, the economic emancipation of the working class is the great end to which every political movement must be subordinated as a simple auxiliary;

That all exertions which, up to this time, have been directed toward the attainment of this end have failed on account of the want of solidarity between the various branches of labor in every land, and by reason of the absence of a brotherly bond of unity between the working classes of different countries;

That the emancipation of labor is neither a local nor a national, but a social problem, which embraces all countries in which modern society exists, and whose solution depends upon the practical and theoretical co-operation of the most advanced countries;

That the present awakening of the working class in the industrial countries of Europe gives occasion for a new hope, but at the same time contains a solemn warning not to fall back into old errors, and demands an immediate union of the movements not yet united;

The First International Labor Congress declares that the International Working Men's Association, and all societies and individualities belonging to it, recognize truth, right and morality as the basis of their conduct toward one another and their fellow men, without respect to color, creed, or nationality. This Congress regards it as the duty of man to demand the rights of a man and citizen, not only for himself, but for every one who does his duty. No rights without duties; no duties without rights."

At the last European meeting of the "International," anarchistic forces under the leadership of Bakounin threatened to gain control, and in order to avoid this catastrophe the Socialists who were still in the majority voted to remove the headquarters of the organization from London to New York. There was another purpose in this also. It was felt by Marx and others that since the doctrines of Socialism had been included in various national working-men's movements and had been somewhat systematized by the discussions of the congress, that the time for a great centralized organization was past, and that its disappearance would be the best thing possible.

The next 20 years saw the growth of powerful national Socialist movements, but with no centralized international organization. At the end of that period these parties felt the need of some sort of co-operation and united in the first of a series of International Congresses at Paris, 14 July 1889. The new international was a creation of the national bodies and not a centralized organization having control of branches in various nations. At this first meeting differences developed so great that two congresses instead of one were held, although some of the delegates participated in the meetings of both bodies. Two years later, at the Congress of Brussels this breach was at least partially healed and it gradually disappeared. In 1896 the old conflict with anarchistic elements arose but was settled by the adoption of a resolution excluding from subsequent congresses those who repudiate political action. The Congress of Paris, 1900, laid the foundation of a new permanent international Socialist

organization by the formation of the International Socialist Bureau. This bureau is composed of permanent delegates from each country, the larger nations electing two and the smaller one. A chairman and secretary were also elected and Brussels chosen as the seat of the international secretariat. With the outbreak of the European War in 1914 Socialism attracted more general attention than at any previous time in its history. Many people had hoped that by concerted action the Socialists of Germany would be able to prevent that country's entering the war. Soon after the declaration of war it was found that practically all of the Socialist parties in the warring countries had cast in their lot with their governments. For 50 years before the war Socialist congresses and Socialist periodicals had discussed the problem of war from every possible standpoint and recognized it and the hostile feeling between nations as the greatest obstacles to the development of a world-wide social democracy. The causes of modern wars, according to a leading American Socialist, are as follows: "The basic cause is capitalism; the contributory causes are imperialism, militarism, social unrest, international grudges and pseudo-patriotism." In 1907 the International Socialist Congress was held at Stuttgart and is memorable for the anti-war resolution passed after considerable discussion between Bebel, Jaures, Vandervelde and others. The terms of this resolution named capitalism as the cause of war and stated that the workers of the world are the natural enemies of war. An additional formulation, proposed by Rosa Luxemburg, Lenine and Martoff, is illuminating, in view of subsequent events. It is as follows: "In case a war should, nevertheless, break out, the Socialists shall take measures to bring about its early termination and strive with all their power to use the economic and political crises created by the war to arouse the masses politically and hasten the overthrow of capitalist class rule." This threat was incorporated in the Stuttgart resolution and was adopted at the Congress of Basel in 1912. Among the means proposed to avert war were a general international strike, the refusal of money for military supplies and a general anti-military agitation. The International Congress of Copenhagen in 1910 modified somewhat the proposals of previous congresses and was undoubtedly less anti-militaristic than its predecessors. An international congress was to meet in Vienna in August 1914 but the outbreak of hostilities prevented its convening. The International Socialist Bureau, with headquarters at Brussels, suspended its activities in July 1914. Vandervelde, chairman of the bureau, became a member of the Belgian government and the bureau was removed to The Hague. Here a conference of Socialists from neutral states (Denmark, Sweden, Holland, Argentina and the United States) was held on 30 July and 1 and 2 Aug. 1914. It passed resolutions blaming capitalism for the war and advocated free trade and a democratization of power. Socialists from the belligerent countries met for the first time at the Zimmermann (Switzerland) Congress in September 1915. The same representatives met at Kienthal 24-30 April 1916. Much opposition and factionalism followed the proposal to renew the International

and to attempt a discussion of the peace problem, in which the German delegates would take part. In 1917 leading Socialists of the world proposed a peace congress to be held at Stockholm. The movement was initiated by the Russian Council of Workmen's and Soldiers' delegates. Immediately the Austrian and German Socialists drew up a peace program in which the main points were "No annexations, no indemnities." Much discussion ensued in the Entente countries relative to the granting of passports to delegates to the Stockholm conference. Ultimately passports were refused delegates in France, Great Britain, Italy and the United States. The Stockholm Conference was consequently not fully representative and while it did not succeed in its peace program, it certainly gave an impulse to the pacifist movement in the warring countries. The progress of the war and its conclusion gave a great impetus to Socialism, which spread more rapidly than ever before and came into power in several of the larger countries of Europe.

Germany.—Germany for a long time led the Socialist movement of the world in the number of votes, representatives in Parliament, press and literature. On the theoretical side German Socialist thought has often been traced back to Hegel and Fichte. Winkelblech, better known as "Karl Marlo," Rodbertus and Weitling also developed ideas of collectivism and premises in economics that were later incorporated in Socialist doctrine. It is only with Ferdinand Lassalle, however, that such theories were linked up with an actual working class movement. Lassalle was born at Breslau, 11 April 1825, studied first at the trade school at Leipzig and then took up philology and philosophy at Breslau and Berlin, passing his examinations with distinction. He became involved in the working class revolts of 1848 and came into slight contact with Marx and Engels, although there is little evidence that he was greatly influenced by them. It was not until 1862 that he delivered his famous lecture on "The Labor Program," before an artisans' association in Berlin. The published copies of this lecture were seized by the police and Lassalle was arrested. At his trial he delivered a speech which was destined to become, under the title "Science and the Workingman," one of the classics of early Socialism. In response to an invitation to address the Leipzig Workingmen's Association he sent his "Open Reply Letter," in which he further explained his program and philosophy. He set forth his adherence to the Ricardian theory of the iron law of wages, which was later to become a bone of contention in Socialist circles. He urged the formation of productive associations of workmen for which he held the state should provide the capital. To secure this end he declared that "the working classes must constitute themselves into an independent political party and must make universal, equal and direct suffrage their watchword. The representation of the working classes in the legislative bodies of Germany—that alone can satisfy their legitimate interests in a political sense." On 19 May 1863 the Congress of Workingmen at Frankfort-on-Main adopted Lassalle's program and four days later the "Universal German Workingmen's Association," which was later to develop into the German Social Democracy, was

founded. Lassalle, however, was destined to see small fruits from his work. After a few months of tireless, energetic, eloquent agitation, with apparently small results, he was drawn into a duel on a purely personal matter, was fatally wounded and died 31 Aug. 1864. For a time considerable confusion existed. The International Workingmen's Association, whose organization at London in 1864 has already been described, began to have an influence in Germany. Wilhelm Liebknecht was its principal worker. Many of the principles of the Marxian economics which had been accepted by the International, were opposed to the doctrines of Lassalle. This was particularly true of the state-assisted productive associations. In 1867 universal suffrage was granted for the North German Reichstag and the Socialists polled between 30,000 and 40,000 votes, electing six members, among whom was August Bebel, who never ceased to play a prominent part in German Socialism, and who had been converted by Liebknecht to the Marxian position and the support of the International. In 1869 at Eisenach the Marxian wing organized the "Sozial Demokratische Arbeiter Partei." For the next few years the strife between the Eisenachers and the Lassalleans was violent. This, however, did not prevent the rapid growth of Socialism and in 1874 331,670 votes were cast for the Socialist candidates. Three Lassalleans and seven Eisenachers, including Bebel and Liebknecht, both of whom were in prison for alleged treasonable utterances during the Franco-Prussian War, were elected to the Reichstag. This great success brought down the wrath of the governing powers and a period of persecution began, the first effect of which was to close up the breach between the two Socialist parties at the Congress of Gotha in May 1875. This union was followed by a rapid increase in the Socialist vote, which by 1877 had reached nearly 500,000. Meanwhile Bismarck was bending every energy to force repressive measures through the Reichstag. It is probable that he would have failed in this had it not been that two insane persons attempted to assassinate the emperor. Bismarck at once declared that these attacks were inspired by the Socialists, although there was never the slightest evidence to justify this assertion. However, he at once dissolved the Reichstag and by means of the most inflammatory appeals to public prejudice succeeded in getting a majority subservient to his purposes. A law was forced through which practically outlawed the entire Socialist movement. It prohibited the formation or existence of organizations which sought by Social Democratic, socialistic or anarchistic movements to subvert the present state and social order. Provision was also made that where even these very stringent measures were ineffective, any city could be declared in a "minor state of siege" in which all public activity was directly controlled by the police. The Socialists at once determined upon a policy of "shamming dead." The organ of the Socialist party was transferred to Switzerland and from there circulated in great numbers throughout Germany. The only attempt at public propaganda within Germany was through the speeches of the Socialist members in the Reichstag. At the first election taking place under this Reign of Terror in 1881, it appeared as if the policy of suppression was succeeding, as the Socialist

vote fell to a little over 300,000. From that time on, however, and in spite of oppression, the party grew by leaps and bounds until in 1890 it polled 1,427,298 votes. It being manifestly impossible to continue to consider a million and a half of voters as outlaws, the Anti-Socialist Law was allowed to lapse in March 1890 and Bismarck was dismissed as Minister. From that time to the present the Socialist movement has continued to grow.

The method of repression having failed to destroy the Socialist movement the new emperor extended the policy inaugurated by Bismarck when his "laws of exception" had shown their ineffectiveness and created the extensive system of social legislation for which Germany has become famous. In the application of this legislation the Socialists and the closely affiliated unions have played a great part.

With the growth of the Social Democratic party to a position of power with a vast number of official positions, both governmental and within its own organization, diverse tendencies developed. The officials have tended to form a "right" wing and with them went a considerable section of the newer voters, especially in South Germany. This section tended to relax much of the old revolutionary position of the party and was largely responsible for the divisions which took place in regard to the voting of military credits in the period immediately preceding the war. Throughout the war the minority wing under Haase and Ledebour preached international Socialism as of old but the majority under Scheidemann identified themselves more or less with the Imperialists and held out for a peace honorable to Germany. The minority desired an immediate peace; condemned war in general and named capitalism in all nations as the real enemy. The collapse of the empire in the fall of 1918 proved to be the long-awaited opportunity of the Socialists. Ebert and Scheidemann became the leaders of the new Socialist republic of Germany. See WAR, EUROPEAN.

THIRTY YEARS' GROWTH OF THE SOCIAL DEMOCRATIC PARTY.

YEAR	Popular vote	Members
1871	124,655	2
1874	351,952	9
1877	493,288	12
1878	437,158	9
1881	311,961	12
1884	549,990	24
1887	763,128	11
1890	1,427,298	35
1893	1,786,738	44
1898	2,107,076	56
1903	3,010,771	81
1907	3,259,020	43
1912	4,250,329	110

France.—France was the home of the Utopian Socialism. St. Simon, Fourier, Cabet and Louis Blanc were among the early founders of this phase of Socialist thought. As early as 1848 the word Socialism had become familiar in French politics. The Commune, 1871, was largely directed by Socialists. When it fell many of these were exiled or imprisoned. When Socialism became again a recognized political

movement it was split into several factions. These later united into a single party with numerous individuals, who had formerly been Socialists, outside of any party. Some of these have since risen to great prominence in the French government. Such are Aristide Briand, several times Premier, Viviani and Millerand. Jean Jaures, by far the best known of French Socialists, was assassinated at the outbreak of the European War. He had been the Parliamentary leader of the party for several years. Jules Guesde, one of the founders of the movement and the foremost French representative of Marxism, entered the War Cabinet, as did also Albert Thomas who became Minister of Munitions and organized the work of manufacturing supplies for the army. Socialist thought has long had an influence in France far beyond its ever large vote. There have been few cabinets for several years without at least one ex-Socialist included and nearly all these have claimed that their Socialist views are unchanged but have offered some excuse for separation from the organized movement. The electoral strength since the first election is as follows:

	Vote	Deputies
1893	440,000	32
1898	751,554	38
1900	863,159	44
1906	878,000	54
1910	1,110,000	76
1914	1,400,000	102

After the invasion of Belgium in 1914 the French Socialists supported their government under the leadership of Jules Guesde. During the progress of the war a small but powerful group developed in opposition to the majority. By the time of the Socialist Congress at Bordeaux in October 1917 this group had impressed its views on a majority of the party and carried through a majority resolution endorsing the Stockholm Conference, declaring for national defense and for participation of Socialists in the government under certain conditions. A minority resolution declared its disapproval of voting credits to the government in any but a war of defense and in favor of a peace without annexations and without indemnities. France sent three delegates to the Inter-Allied Socialist and Labor Conference of 1918 at which documents were published representing the most constructive note so far struck by the Socialist or labor movements. One of these dealt with the war aims of the Entente, while the other proposed a program for social reconstruction which was afterward presented to the Peace Conference at Paris.

Austria.—The diverse nationalities that made up the former Austro-Hungarian Empire made the work of organizing a united Socialist movement difficult. A branch of the "International" existed in Austria in 1867. In 1869 it organized a demonstration in which 100,000 men marched to the palace in Vienna to demand universal and direct suffrage, freedom of speech and association and liberty of the press. Profuse promises of reform were made by the government while the workers were around the palace, but as soon as they were disbanded the leaders were arrested and a period of brutal suppression which followed

momentarily annihilated the Socialist movement. The present party, which is an outgrowth of the union movement, was organized at a congress in Vienna in 1888. It began with a demand for an extension of the suffrage and succeeded in gaining a class system, in which the nobility and clergy form one class, the great capitalists the second, small property-owners the third and the wage-workers a fourth, each with equal representation. Even under this system the Socialists succeeded in casting 750,000 votes in the fourth class and electing 10 members of the Reichsrath. In January 1907 as a result of a threatened general strike the suffrage in Austria was made universal and direct. In the elections held in May of the same year the Socialists cast 1,041,948 votes and elected 87 representatives. Then came a period of reform parliamentarism which discouraged the workers so that in 1911 although the popular vote was slightly increased the number of representatives fell to 82. The party was badly split up with nationalist quarrels and a small faction also split off in opposition to the war.

During the first three years of the war the Austrian Socialists were rendered impotent through the strong militarist policy of the imperial government. By 1918, however, Socialist demonstrations increased; a "peace strike" involving 100,000 in Vienna alone was inaugurated in January. The Socialists protested vigorously against the emperor's instructions to the Premier on 4 May to take measures to prevent the reassembling of Parliament. The Social-Democratic party on 2 June demanded the assembling of Parliament and the initiation of steps toward peace. During the summer Bolshevik influences were manifest in several parts of the empire. Revolutionary activity increased and mutiny and desertion were rife in the army. The fall of the empire came on 3 November, a provisional government was organized and a republic proclaimed, which was composed of the moderate wing of the Socialists. In Hungary a more radical group seized the reins of government and chaos resulted for a time.

Great Britain.—The Socialist movement in Great Britain has always been distinguished from that of the Continent by a greater freedom from dogma and a greater variety of expression. There has never been one large unified party and Socialist legislation has come through the action of various bodies. The Social Democratic Federation, organized in 1879 and adopting a Marxist platform in 1883, was the first Socialist party. It has gone through many changes and finally merged in the British Socialist party, which split in 1915 on the question of the attitude to be taken toward the war. The Independent Labor party, which has never been distinctly Marxian, was organized in 1893. The Fabian Society, organized in 1884, is a body of educated writers and speakers, the most prominent of whom is Bernard Shaw, and which is distinctly anti-Marxian. The Labor party, which started as the Labor Representation Committee, with representatives of all the foregoing organizations and also of the unions, is the political expression of the Socialist movement. The total membership of the bodies united in the Labor party in 1912 was given as 1,895,498. Of these 1,858,178 were included in the union membership and 31,237 were members of the various Socialist organi-

zations. It casts about 1,000,000 votes, and had 40 members in the Parliament which was in session during the war. The Socialists of Great Britain were sharply divided on the war. The Independent Labor party fought against the war until it came, then opposed conscription and worked constantly for peace. Large numbers of its membership were imprisoned for their agitation. The Labor party, while insisting upon its position as a peace party, generally supported the government during the war. The British Socialist party split, with H. M. Hyndman, often called the father of English Socialism, leading the pro-war faction. All sections of the Labor party fought continuously to protect working-class interests during the war and were almost uniformly successful. At the general election of December the Labor party did not increase its strength, but it was successful in several by-elections held subsequently.

Belgium.—In Belgium there is but one Socialist party, the Parti Ouvrier Belge, which was founded in 1885. For several years the franchise was very limited and the Socialists were barred from any effective political action. Accordingly the early years of the party were given up to agitation in favor of universal suffrage. This culminated in a series of great demonstrations and finally in a general strike in 1893, which resulted in the granting of universal suffrage to all males over the age of 25 years. This was much qualified, for in many elections there is a complex system of plural voting by which those possessing property or special educational qualifications have two or three votes, while the propertyless wage-workers have but one. Yet at the first election in 1894 the Socialist party polled 320,000 votes and elected 28 deputies out of 152. Owing to fusion with the Liberals at recent elections it is impossible to give the Socialist vote exactly but it is generally estimated at 500,000 for the election of 1914, when 40 Socialist deputies and four senators were elected. The principal characteristic of the Belgian Socialist movement is the peculiarly close affiliation of the three phases of the working class movement, the co-operative, trade union and political activity. Practically every trade unionist is also a Socialist and a member of some one of the co-operative organizations.

Denmark.—The Socialist movement of Denmark is closely affiliated with the unions, which include 75 per cent of the working class, including rural laborers. A powerful co-operative movement among the farmers is also connected with the Socialist movement, and has made Danish agriculture a model of organization. The movement here has shown a steady growth and in 1913 the Socialists polled more votes than any other political party, and 30 per cent of all votes cast. The king asked the Social Democrats to form a government. They refused to do this but agreed to support a radical government if pledged to a series of reforms for which the Socialists had been fighting. These reforms included universal suffrage for all men and women over 25 years of age, direct election of members of Parliament by popular vote and the removal of all right of appointment to office from the king. This agreement was made and the radicals formed a government. But upon the outbreak of the war

an effort was made to postpone these measures. The strong Socialist representation refused to compromise and on 5 June 1915 the suffrage law demanded went into effect, and the other measures were taken up for consideration. The vote of the party from the beginning has been as follows:

1872.....	268	1898.....	31,872
1876.....	1,076	1901.....	42,972
1881.....	1,689	1903.....	55,479
1884.....	6,806	1906.....	76,612
1887.....	8,408	1909.....	93,079
1890.....	17,232	1910.....	98,718
1892.....	20,094	1913.....	107,365
1895.....	24,508		

The Socialist strength in the government was impaired at the general elections of April 1918 at which but 39 Socialists were returned members of the Folketing.

Finland.—The Finnish Socialist party was established in 1899 and in 1916 became the first Socialist party to gain an absolute majority of any legislative body, by electing 103 out of the 200 members of the Finnish Diet. Owing to the activity of the Socialists, Finland was the first European country to grant absolute political equality to women, and 24 of the Socialist members of the Diet are women. The vote has increased steadily from 100,000 in 1904 to 286,792 in 1916. The Socialists have organized a powerful co-operative movement with its social centres in each village so that to-day there are more Socialist clubhouses than churches in Finland. In 1917 Finland was declared an independent republic. Civil war broke out in 1918 between the Red (Bolshevik) Guards and the White Guards. The latter favored the Germans, who landed troops for their assistance. A Radical Socialist (Red) government was set up at Viborg in April 1918 and a White Guard government at Vasa. After a turmoil of several months a peaceful revolution was effected in December and the moderate Socialists secured control of the government.

Holland.—The Social Demokratische Arbeiderspartij of Holland was organized in 1894. A conflict with the anarchists, led by Domela Nieuwenhuis, formerly a Socialist, led to their expulsion from the old "Socialisten Bond," which they at one time controlled. The "Bond" then merged with the regular Socialist party, and the daily paper, *Recht voor Allen*, founded by Nieuwenhuis, became a Socialist organ. The party grew steadily and in June 1913 cast 144,000 votes and secured 19 seats in Parliament. The Socialists then held the balance of power and were invited to join in the formation of a ministry but refused. Many important municipal positions are also held by Socialists. In the closing months of 1918 the Socialist leader in Parliament, Peter J. Troelsta, criticized the queen and incited to revolution. Riots and demonstrations were of frequent occurrence due to the high prices of food-stuffs and the general dissatisfaction with the pronounced German leanings of the queen and her entourage.

Italy.—During the years when the Socialist movements of most of the other nations of Europe were gaining their first foothold the Italian workers were still under the influence of the bourgeois liberalism of Mazzini or of the conspiratory anarchism of Bakounin. The

present Socialist party was founded at Milan in 1892 and its organization perfected at Genoa in 1892. It received 27,000 votes in the election of 1893. This was followed by a period of oppression under Crispi, during which thousands of Socialist voters were disfranchised by a so-called revision of the electoral lists. The Crispi ministry was wrecked on the Abyssinian expedition and his successor, Rudini, somewhat relaxed the persecution. In 1900, owing to fusion with a radical party, 175,000 votes were cast for Socialist candidates. This was the beginning of an internal struggle that ended in 1912 in the expulsion of four of the reform wing who were members of the Chamber of Deputies. One of these, Bissolati, was the most noted orator of the party, and at the outbreak of the war entered the cabinet. The immediate result of the split, and an extension of the right of suffrage, was a most rapid growth of the party. At the election of 1913 the radical wing cast 960,000 votes and elected 59 deputies. The reform wing cast 200,000 and elected 21 deputies. The radical wing stood solid against participation in the war. The reform wing favored intervention and supported the war. A peculiar phase of the Italian movement is its great strength in agricultural sections where it has established powerful co-operative associations that directly operate the farms. See *ITALY—Italian Socialism*.

Norway.—The Social Democratic party was founded in 1887, secured 732 votes in 1894, when it first participated in the elections, and steadily increased that vote until it reached 196,000 in 1915, when 20 Socialists were elected to the Storting. The party took a decided stand against any form of militarism at its congress in 1915, declaring for disarmament, neutrality and obligatory arbitration. The party has great power in many municipalities, a powerful women's and young people's movement and is closely affiliated with the unions and co-operatives.

Russia.—Because the Socialist movement, save for a very brief period, was compelled to organize and conduct its campaign in secret, and because of the autocratic character of the government it is difficult to give specific facts concerning it. Three parties are accorded representation by the International Socialist Congress—the Social Revolutionary party, the Social Democratic party and the Group of Toil. The latter is a peasant party, based upon the primitive communism which still prevails in Russian village and rural life. The Social Revolutionary party has adopted more or less terroristic methods which separate it from other Socialist movements. The Social Democratic party is the only one which is strictly comparable with the Socialist parties of other countries. The only time that there was an opportunity for a test of Socialist strength was in 1907, at the election of the first Duma. Even then there was more or less terrorism on the part of the government. But the Group of Toil at this election sent 116 members to the Duma, and the other two parties combined, 101. Election laws and the suppression of open propaganda reduced the legislative strength of all these parties to a small fraction of these numbers. It later became almost impossible for a Socialist to be elected or even to vote. Yet in spite of these laws there were 13 members of

the Socialist group in the fourth Duma, which was in session when the war broke out. All of these refused to vote for the war credits and opposed the war. In revenge the government sent five social Democratic members to Siberia. The Social Democrats continued to spread their Marxian doctrines despite government repression and united other wings of the Socialists, to bring about the revolution of March 1917 which put an end to Tsarism. Kerensky, a revolutionary Socialist, became Minister of Justice in the new government. The Social Democratic party issued an appeal to the workers of all countries to unite in putting an end to a war, begun and carried on solely for the benefit of kings and financiers. In June 1917 Lenine, the radical Socialist, attacked the war policy of Kerensky's government. On 7 Nov. 1917 the Bolsheviks revolted under Lenine and seized the government. The Bolshevik government at once proposed a three-month's armistice, and at once set about publishing the secret treaties made by the Tsar's government with the Allies. The internal policy of the new radical Socialist government was inaugurated by a series of decrees transferring property. Through many vicissitudes the Bolsheviks remained in power and administered the government upon the basis of extreme Socialism.

Switzerland.—Long the home of exiled revolutionists, one of the strongholds of the "International," several of whose congresses were held in Geneva, it was not until 1888 that a Social Democratic party was founded in Switzerland. To be sure, the Grütli Verein, had existed as a political working-class organization of a democratic-radical character since 1838. In 1901 it joined with the Social Democratic party, retaining its autonomy. The vote in 1911 was 120,000. This was increased somewhat in 1914 when 18 Socialists were elected to the National Council. The extensive unemployment due to the war caused a slight falling off in membership in 1915-16. The party maintained its pacifist position throughout the war and worked constantly to secure similar action by other parties.

Spain.—At a congress held in Barcelona, June 1870, it was claimed that 40,000 members of the "International" from Spain were represented. Owing to the disruptive influence of Bakounin this movement almost completely disappeared. The present Socialist party was founded in 1879, but was not strong enough to hold a congress until 1888. In 1891 it received 5,000 votes. This vote was regularly increased until in 1910, when a coalition was made with the Liberals, 41,000 votes were polled, and Pablo Iglesias, long the most prominent member of the party, was elected to the Cortes. He was re-elected in 1912, when a further slight increase in the vote was secured.

Sweden.—The propaganda of Socialism was introduced into Sweden in 1881 by August Palm. In 1889, at the first trade union convention held in Sweden, the program of the German Social Democrats was adopted and the unions have ever since formed the backbone of the Socialist movement. The party grew steadily in membership until 1909 when, as the result of the defeat in a general strike, it fell off from 112,693 to 60,813. The growth

then began again and continued until 1915 when it was about 90,000. There have been sharp divisions in the party in recent years. The more radical section wished to conduct an active campaign for a republic which the conservatives opposed. This division climaxed in a split over the attitude of the party on the war. Whether this split will continue after the war cannot now be foretold. An election in 1915 resulted in 265,000 votes for the Socialists, and the election of 87 members of Parliament. This makes the Socialist party the strongest with 86 Conservatives and 45 Liberals in opposition. A powerful young Socialist movement which works with the radical wing is one of the features of the Swedish movement.

Australia.—The Australian labor movement has been characterized as "Socialism without phrases" and, while many Socialists would dispute the characterization, it has a large element of truth. The Labor party, which has a majority in both houses of the federal Parliament and in two out of six state legislative assemblies and strong representation in all the others, does not declare for the socialization of industry. Indeed it specifically announces that it does not stand for the socialization of certain industries such as the retail trade. Yet it has gone much further toward the state ownership of industry than any other party and, during the war, went to great lengths in the nationalization of certain branches of the retail trade. The total vote of the Labor party is estimated at about 2,000,000. There is a small orthodox Socialist party in every state which keeps up a sharp criticism of the compromising character of the Labor party. The latter is a direct creation of the union movement and is controlled more by the union congresses than by any machinery of its own. During the war the party divided on the question of conscription which was endorsed by many of the leaders, including Premier Hughes, but which was defeated by a referendum. Since most of the opponents of the Labor party were conscriptionists this would indicate that a majority of the Labor party are in favor of a more radical program. This conclusion is drawn from the fact that the radical, more orthodox Socialist wing, fought conscription successfully.

China.—The Socialist movement in China, which had existed in a rather indefinite way for several years, sprung into sudden prominence when its leader, Sun Yat Sen, was elected as the first president of the short-lived republic, the Parliament of which also contained 30 Socialists. At this time the party had a powerful press, a wide spread organization and a program based upon that of international Socialism, modified to meet Chinese conditions. But the movement was manifestly exotic, dependent largely upon foreign educated students, and went down when the rebellion was crushed by Yuan Shi Kai. It is difficult to tell how much of the movement remains, but there is certainly a strong organization working for Socialism in China.

Japan.—The Japanese movement, which is directly affiliated with the international movement, has existed since 1899. The government has pursued Socialists with a brutal persecution which culminated in the hanging of 12 in 1910.

and the imprisonment of a large number of others. As was natural, persecution drove Anarchists and Socialists together and led to reciprocal violence. In spite of the persecution many of the foremost scholars of Japan have identified themselves with the Socialist movement and it maintains a press of considerable importance in which Socialism is taught indirectly through discussion of current questions.

There are also strong Socialist movements in Bulgaria, Serbia, Rumania, Greece, Hungary, Poland, Portugal, Canada, Argentine, Brazil, Chile, South Africa and New Zealand. In fact it is now impossible to name a section of the world where capitalism has reached that Socialism has not followed like a shadow. There have been many compilations of the total Socialist strength. The following, prepared by the information department of the Socialist party of the United States, while not at all points agreeing with the figures given elsewhere, is probably as close an approximation to the situation in 1914 as can be obtained.

COUNTRY	Membership	Vote	Parliament	
			Socialist	Total
Argentina.....	4,000	48,000	10	120
Australia.....	200,000	678,012	66	111

Totals.....	2,716,649	11,701,291	841	6,416

In addition to the vote and membership figures as given above, there are also Socialist movements in Armenia, Bolivia, Chile, China, Cuba, Iceland, Japan, Newfoundland, Persia, Turkey and Uruguay.

United States.—The industrial condition of the United States prevented the appearance of any strong Socialist movement until within comparatively recent years. The presence of an ever-moving frontier led to a social stratification by geographic stages which was constantly changing and which, therefore, prevented the appearance of any such continuous class struggle as a Socialist philosophy presupposes. The presence of free land and the expanding market meant a large opportunity for individual advancement, both from the ranks of laborers to capitalist and from small capitalist to large capitalist. The Socialist movement is peculiarly a product of the industrial proletariat, and while the population of the United States remained largely rural such a movement could gain no great strength. Again, the existence of chattel slavery throughout the South, prior to the Civil

War, created an economic contest between these two forms of industrial organization which overshadowed the still somewhat indistinct contrast between laborers and capitalists. But though these industrial conditions prevented the growth of Socialism in the Eastern sections they gave the greatest encouragement to the growth of a Utopian Socialism, and so it came about that for many years the United States was the experimental ground on which were tested the various theories of European Utopians. These movements are often confounded with latter-day Socialism. They really had practically no connection save that both have the idea of collective production. But the collective production of the colony is to be a scheme worked out in our present society, while the collective production of modern Socialism is simply one phase of the coming social stage. William Weitling came to America in 1849 and succeeded in organizing something of a Socialist movement in New York in the years immediately following. His movement, however, was of short duration as was also that of Joseph Weydemeyer, who came shortly after him and who was a personal friend of Marx and Engels. The Civil War wiped out nearly all traces of both of these movements. After the War the influence of the "International" extended to America. This influence was first seen in the National Labor Union in which William H. Sylvius was the most prominent worker and which practically disappeared with his death in 1869. During the next three years numerous sections of the "International" were organized throughout the country, and on the removal of the "International" to this country some attempt was made to revive it, but its last convention was held in Philadelphia 15 July 1876, and this convention formally dissolved the organization. On 4 July 1874 the Social Democratic Workingmen's party of North America was organized with a rather indefinite Socialist platform. This grew in strength during the next few years and in 1877 the name was changed to the Socialist Labor Party of North America. Following the extensive labor troubles of 1876 and 1877 this party grew into national prominence and succeeded in electing minor officials in several States. But it was still too indefinite to protect itself from anarchistic influences which crept in and which nearly wrecked the party until finally those influences reached their climax and their end in the Haymarket incident in Chicago. The work of organization had now to be practically all done over again. In September 1887 the Sixth National Convention of the Socialist Labor party, held at Buffalo, N. Y., took up the work of reorganization. The Socialist elements in the labor movement were still rent with internal feuds, but by 1889 a steady upward growth began to be seen. Meanwhile, certain other movements which have undoubtedly contributed to the strength of Socialism had developed. The Greenback party and the Henry George movement both contained many of the ideas of Socialism and undoubtedly proved a means by which many were led to adopt the Socialist position. In 1892 the Socialists for the first time nominated a Presidential ticket consisting of Simon Wing of Boston, Mass., and Charles H. Matchett of Brooklyn, N. Y.

In 1899 the Socialist Labor party split,

largely over the proper relation to be maintained between the party and the unions. The largest fraction united with the Social Democratic party that had sprung up around Eugene V. Debs as a result of the American Railway Union strike in 1894. This union took place at a convention in Indianapolis, July 1901. For four successive elections Eugene V. Debs was the Presidential candidate, polling a steadily increasing vote. The party has also elected many members of State legislatures, two members of Congress and many municipal officers. The party membership for 1915 was nearly 100,000. The vote of the two parties from their establishment has been as follows:

YEAR	Socialist Party	Socialist Labor Party	Total
1888		2,068	2,068
1890		13,704	13,704
1892		21,512	21,512
1894		30,020	30,020
1896		36,275	36,275
1898		82,204	82,204
1900	96,931	33,405	130,336
1902	223,494	53,765	277,257
1904	408,230	33,546	441,776
1906	331,043	20,265	351,308
1908	424,488	14,021	438,509
1910	607,674	34,115	641,789
1912	901,062	30,344	931,406
1914	874,691	21,827	896,518

The Socialist party throughout the war continued its "active and public opposition to the war." Numerous groups tried without success to modify this opposition. As a result serious defections resulted. Most of the Socialist periodicals were denied the second-class mailing privileges and many were arrested and imprisoned under the Espionage Act and other war-time laws. In the elections of 1918 Socialist representation was cut down in many instances through the fusion of the reactionary Republican and Democratic parties. The Socialists who opposed the anti-war activities of the old party formed a separate organization called the Social Democratic League. It supported the war on the same bases as the Inter-Allied Socialist and Labor Conference.

SOCIALIST PARTY, The. See SOCIALISM.

SOCIETIES, Criminal. To find the origin of the idea that has given the world its criminal associations it would be necessary to conduct the search into the realm of fables, for if there has been a time when bands of outlaws have not levied tribute upon poorly protected property, history is silent upon that point. Modern brains only have comprehended the full possibilities of the co-operative idea as applied to the commission of crime, but the earliest applications of the theory, however crude, were probably quite effective. When in the 11th century, Assan-

ben-Sabbah, the "Old Man of the Mountains," securely protected in his rocky fortress, inspired and directed the horrible crimes of his great band of devoted, hashish-drunken followers, he taught the world a new truth and presented it with a new word, neither of which have been forgotten. The truth was the first clear demonstration of the fact that when associated crime is well organized and carefully directed, ordinary methods of protection are powerless to cope with it. The word was "assassin," the title derived from his own name, which he bestowed upon his band. From that time the criminal association has been too serious a matter to be the inspiration of either song or story. Any attempt to tell the story of the modern criminal society begins with the Camorra and the Mafia, the two most powerful organizations of the kind the world has ever known. Born and nurtured in Italy, at the dawn of the 19th century, they grew and waxed strong until the one-time clubs of petty criminals had become the gigantic octopus which overawed the entire country and threatened to cause the downfall of the government which had so carelessly permitted such development of a lawless course. Efforts have been made, of late, to cast the shadow of uncertainty upon the primary purpose of these societies. It has been suggested that they were originally organizations of patriots who had banded together to protest against existing tyrannies. A careful study of the history of the time, however, and a close examination of the earliest works of the associations will prove the fallacy of such a theory. Instead of having a noble past to look upon, these organizations have always been bands of the most heartless criminals, a constant menace to any government and to all laws.

For some time before the Camorra's time, Italy had been writhing in agony beneath the heels of the most corrupt and incompetent body of officials who ever attempted to rule a nation. The one object of the government was to extract as much money as possible from the people and to give absolutely nothing in return. Taxes which were high were collected relentlessly, but little of the money obtained was expended for the benefit of those who had been taxed. Governmental works were at a standstill, government officials were unpaid and the immense sums of money which had been extorted from the people were wasted upon royal favorites. Little by little the corruption in high places permeated the whole fabric of society. Justice became a thing unknown. If suit was brought the richest man won, for there was not a judge in the land who was not willing to sell his decision to the highest bidder. Acting upon the same principle the police became the partners of the criminal. As personal wrong and offenses against the laws were never punished, crime became rampant. The poor, robbed by the rich, proceeded to recover from their oppressors by force that which had been taken from them by process of law, and life became a thing of little value.

Then came the French, with their peculiar form of oppressions, which culminated in the theory that a man in prison was a more tractable subject than a man at large. In pursuance of this idea thousands of arrests were made, and the men, unconvicted, were left behind the bars.

In a week the poor penal accommodations of the country were taxed to the last limit, but, as the work had only just commenced, castles were seized and turned into prisons. Having arrested their men, however, the French dismissed them from mind. "We will watch them to prevent their escape," they said, "but we will let the local authorities feed them." But as the local authorities had too much trouble to raise the indemnities demanded by the conquerors to think of bothering themselves about men who were securely locked behind iron bars, prisoners who were not blessed with independent means had no other option than to starve. As the natural result the strong commenced to prey upon the weak and anyone who had money was robbed without mercy. Among the prisoners there was one in whose brain lodged the seed of socialism. This man was Antonio Giaperelli, and to him belongs the somewhat doubtful honor of having organized the first society of the Camorra. He had noticed that, while new prisoners were always robbed immediately upon their arrival, few of the inmates of the prison profited by these robberies, and he suggested a plan providing for the systematic fleecing of all newcomers, the plunder to be shared equally among all the prisoners. The suggestion met with the approval of the majority and the scheme worked so well that it was not long before the plan was adopted in every prison in Italy. For a time the organization of the Camorra was thus confined within prison walls, but as the members were released it was suggested that a plan that had worked so well under circumstances in which the opportunities for plunder were so meagre might advantageously be extended. Up to the year 1828 the word Camorra had no meaning except to those who had made the acquaintance of the society in some prison, but during that year the name was written in letters of blood that made all Italy tremble. One day a merchant in the city of Naples was visited by a stranger who asked him to contribute to the support of the "Camorra." Not knowing the man, and never having heard of such an organization, he naturally refused. The visitor insisted and the merchant was finally compelled to eject him from the shop. Other stores were visited, with a like result, and the strange collector disappeared as he had come, unknown to all. The next day Naples had its sensation. When the wife of the first merchant had attempted to waken her husband she had found him dead in bed, and the stiletto that pierced his heart held to his breast a placard on which it was stated that his death was the result of his refusal to assist in the support of the Camorra. A day or two passed, just time enough to allow the story to become generally known, and then another stranger appeared upon the streets of the city. Store after store was visited and the same request was made, but this time the words, "for the Camorra" carried such frightful import that many merchants submitted to the blackmail. Some refused, however, and the next morning the murder of another business man warned the people of the uselessness of their attempt to withstand the demands of the order.

From that day the power of the Camorra became practically absolute. From city to city its work was extended until its name was heard

with dread in every part of Italy. At regular intervals each storekeeper received a visit from the strange collector and, as death was the penalty of refusal, the money demanded was usually paid without protest. No one was exempt. Wherever goods were sold or trade of any kind was carried on the importunate collector stood ready to receive his share of the profits. He was permitted to go everywhere. He was at the custom house, where he collected his tolls as conscientiously as if he had been a government agent. If money was deposited he stood by the side of the depositor in the banking house. Nothing escaped him, and when the business day closed he paid his visits to the wine shops, the gaming houses and all dens of vice, for the officials of the society were not particular as to the methods used in the making of money so long as they received their share of the spoils.

In this manner was the country terrorized by the operations of a society which had become more powerful than the government. Several half-hearted attempts were made to suppress it, but as its membership was composed of persons from every walk of life the blackmail continued, and at last became open highway robbery. Then it was that the streets of the cities became unsafe either by day or night, and the finding of a dead body on the public highway was of such frequent occurrence as to occasion but little comment. The victim had simply refused to pay his tribute to the Camorra.

It was not until 1877, therefore, that any progress was made in the restoration of order. Then United Italy took the matter in hand, and as this crusade was conducted by honest men who were ready to act with energy and determination, hundreds of the agents of the association were soon arrested, and, as executions and long imprisonments followed, penalties to which the highest as well as the lowest were subjected, it was not long before the dreaded Camorra ceased to be dreaded.

While never as powerful an influence for evil as the Camorra, the Mafia was organized upon similar lines, and the fact that it is more recent makes it of greater interest. Like the parent society its purpose was one of murder, robbery and blackmail. Like the parent society it became stronger than the government in its own country, and, as in the case of the Camorra, was only subdued by the exertion of the authorities of the United Italy.

There were two factors that played an important part in the organization of the Mafia. The first was the presence of numerous bands of outlaws organized as a protest against the non-resident land ownership, which had caused so much poverty and misery in that part of the country. There can be no doubt but that these conditions were about as hopeless as present-day imagination can picture. The Sicilian peasants had suffered untold miseries at the hands of the heartless agents of the alien landlord, and the ignorance and natural viciousness of the people could suggest but one way out of the difficulty. Assassination and robbery was the remedy. The other factor was the presence of thousands of bravos, soldiers and courtiers who had lost their occupation when Ferdinand granted the demand for a liberal form of gov-

ernment. The abolition of the petty courts, of which there had been so many in the Two Sicilies, threw these men out of employment, and, as they cared neither to work nor starve, they naturally thought of brigandage as the one way out of the difficulty. With that idea in view scores of military clubs were formed and these were the cloaks behind which the members committed their murders and robberies. It was at this time that Mazzini appeared upon the scene. How much he saw of the patriotic side of the question, how much of the criminal, will never be known. We only know that it was his constructive genius that welded the two factors together and that it was to him that we owe the existence of the Mafia. Strange as it may seem the name "Mafia" is meaningless and the word does not appear in any dictionary of the Italian language. In fact, up to the year 1859 the word itself had not been coined. It was only when Mazzini had gone from club to club, and from outlaw band to outlaw band, forming branches of his secret society that such a title was conceived. Mazzini called his united clubs "Oblonica," a name which was derived from two Latin words, "obelus," a spit, and "nico," I beckon, meaning "I beckon with a spit," the latter, of course, being the stiletto with which the society was to do such deadly deeds. To say that Mazzini was thoroughly in sympathy with the horrible work to which the society later devoted itself is to go a step beyond the historical, but its purposes, as expressed in the words, "Mazzini autorizza furti incendi avvelenamenti," meaning, "Mazzini authorizes thefts, arson, poisonings," gave to the association of criminals its name, the initial letters of the five words being used to form the new word, "Mafia."

The extent to which the Mafia had expanded was shown in 1876, when the government was called upon to investigate the abduction of an Englishman named Rose. The sum of \$20,000 was demanded, and paid, for his release, and the investigation which followed was so revolting in its details that the result was suppressed by the authorities. It had been shown that the money had been divided among many people of various conditions, from the peasantry to the commander of the post, whose gendarmes were supposed to be pursuing the bandits; the chief of police and detectives of the district, and even the judges of the courts, they having promised immunity in case the abductors should be captured. When the government of Italy was notified of these facts it took the matter in hand. The corrupt soldiers and officials were sent to another part of the country, being replaced by sturdy and honest regiments from the borders of the Tyrol and the mountains of Switzerland. The new men had no sympathy with crime, no friendship for the criminal. They knew that it was their sole duty to carry out the orders of their superior officers and they performed this duty with a vigor with which even the powerful Mafia could not cope. Whenever or wherever a man was found who could not give a perfectly clear account of himself, or prove that he had no connection with the murderous society, he was shot on the spot. It has been estimated that no less than 5,000 persons met their death at this time, and while the search must have resulted in the killing of many inno-

cent people, the object of the crusade was accomplished, and the Mafia, after its years of prosperity, was driven into obscurity. During this campaign of extermination, however, hundreds of the members of the Mafia made their escape, and many of them came to this country. Rumors to this effect were common at times, but they were not treated seriously until 1890, when the hand of the society was felt in the killing of Chief of Police David C. Hennessey, of New Orleans.

For several years there had existed two rival stevedoring firms in New Orleans, the Provenzanos and the Matrangos, which were in competition for the business of discharging and loading the vessels engaged in the Central American trade. The Provenzanos controlled this business for some time, but their services proving unsatisfactory for some reason, the work was transferred to the rival firm. Then the trouble began. The Provenzanos contended that their services had been dispensed with because the shipowners were held in terror by the Matrangos, who had threatened them with the Mafia. The Matrangos, however, denied the imputation, and made counter charges in which the Mafia played an important part. In accordance with his duty the chief of police proceeded to look into the matter. Absolutely honest and utterly fearless David Hennessey realized that his discoveries would cost him his life if the society he had unearthed should ever be able to reach him. "They may get me," he said to a friend, "but if they do they will get me in the back," a prophecy which was realized on the night of 16 Oct. 1890, when he was shot to death on Girod street. The assassins had been concealed in doorways and, after he had passed, had stepped out from their hiding place to rain upon him a perfect fusillade of bullets. He had threatened to exterminate the Mafia and the Mafia had replied by removing him.

The finale to the story is a unique page in American history. Arrests were made, but conviction seemed impossible, and, at last, the people of the city determined to take the matter into their own hands. That there were stiletto societies in New Orleans was no longer a matter of doubt. They existed and they threatened the security of the city. Their members had killed the chief of police and they had threatened to kill others, including Mayor Shakespeare, who had been bold enough to say:

"We owe it to ourselves to see that this blow is the last. We must teach these people a lesson that they will not forget for all time. No community can exist with murder societies in its midst. The societies or the community itself must perish."

The blow that followed was one from which the Mafia in this country never recovered. It was not used to that treatment, and, since the New Orleans lynchings, it has not raised its head. Police reports have indicated, however, that it still exists in private, and there are occasional crimes that may be traced to its door, but this dark-cellar existence has little about it to inspire dread, even in the heart of the most timid. Another Italian criminal society appeared in Turin in 1868. Organized for the systematic commission of large criminal affairs, it made a specialty of safe-robbing, but undertook any promising robbery, and did not hesitate at murder. At one time they

had 200 members. When the public became aroused to extirpate them, few could be located, and it was believed that most of them escaped to the United States. From 1905 to 1909 "Black Hand" associations were active in the United States and led to the assassination in Palermo 13 March 1909 of Joseph Petrosino, a New York detective who had shown especial skill in tracking the criminals.

From time to time organizations, more or less criminal in purpose, have come into existence in the United States, and it argues well for the character of the people that their life has invariably been of brief duration. As long as the Ku-klux Klan maintained its original purpose it was unmolested, but when its members resorted to the deeds of violence and bloodshed which made its name the synonym for the most brutal lawlessness, both North and South joined hands to wipe out the organization. See KU-KLUX KLAN.

With 12 murders and a countless number of attempted assassinations to its credit Mollie Maguireism terrorized the coal fields of Pennsylvania for more than 20 years. Unlike the Ku-klux Klan, the Molly Maguires were utterly devoid of noble principle. The first lodge was instituted with criminal purpose and from that day until the last Molly murderer was hanged it remained the most thoroughly organized murder society this country has ever known. For years it was the power which ruled in the coal fields. See MOLLY MAGUIRES.

From the time of its earliest historical record Asia has been at the mercy of its murder societies and other criminal organizations. The dacoits of India, the Hindu thuggee, the khunhuz of northern Asia, all prove that, from one end of the continent to the other, criminals believe in seeking safety in numbers. The Boxers of China, who are but one of the many criminal wings to the vast secret society system which prevails in that country, have exploited their strength so recently that their horrible work is still fresh in the minds of the civilized races of the world. For absolute corruption, for unalloyed crime, no criminal organization yet known to history can compare to those of China, and some of these associations still flourish, to a certain extent, in every large city in this country under the name of highbinders. One of the most powerful is the Sam Hop, known here as the Chee Kung Tong. The history of the Sam Hop Tong can be traced back more than 250 years. According to tradition it has existed since the establishment of the Chinese nation. Its organization is said to have been due to divine revelation, and it is known that, in its early days, its character was entirely patriotic. It has always been a power in the Celestial world. It helped to overthrow the Tartar Dynasty, it was the cause of the Tai-ping rebellion, and of the more recent Ko Lo revolution. Many of the most frightful outrages against the missionaries can also be traced to the Sam Hops. During the two or three centuries of its existence, however, the character of the association has changed. From a patriotic organization, whose only object was to protest against the outrages of a foreign dynasty, the society has become an association of men banded together solely for purposes of murder, robbery and blackmail. On arriving in this country the Sam Hops or-

ganized under the name of Chinese Masons, and it was not until 1891 that the police accidentally discovered that the apparently innocent title was a shield to disguise a criminal association. By this time, however, the Chinese quarter of San Francisco had become a hot-bed of crime and highbinder outrages were of frequent occurrence in every large city in the country. Victims of the Sam Hops, unwilling to apply for police protection, organized rival tongs. At first the murders had been committed only by ones or twos, but finally pitched battles were held on the streets, on which occasions scores of lives were taken. These murders, however, were not the only bad feature of highbinder domination. When the members were not killing each other they were levying blackmail upon merchants and wealthy Chinese, compelling them to pay exorbitant prices for the privilege of being unmolested. They also pursued highway robbery with perfect fearlessness and assumed entire control of the traffic in slave girls. In San Francisco, where they were most bold, the police often declared war against them, but with little success until about 1898, when the Chinese business men took the matter in hand, and, at their request, the Chinese officials in this country appealed to the home government for assistance. Then a crusade in earnest was undertaken. The meeting places of the various tongs were found and broken open; record books and other documentary evidence was seized, and hundreds of arrests were made. As the punishment which followed these arrests was applied in the Chinese custom, extending to the relatives of the offenders, those who were still in China being killed and tortured, it was not long before the criminal organizations were driven into comparative obscurity.

The most noxious criminal organizations in the United States have existed in the larger cities, where they have resorted to a higher class of frauds and robberies. Those that have devoted themselves to the open country, on the other hand, have been made up of men of a lower criminal stamp, like our own gangs of outlaws, and have been guilty of murder and robbery with violence. Usually these bands have been composed of young men, under the leadership of the most determined man in the company, as in the case of the Younger and James gangs, but there have been instances in which even women have been the leaders of such associations of lawbreakers. Louise Bouviers headed a society of 40 men, and the leader of one of the most heartless companies of Indian dacoits was a woman. While such bands of criminals have usually been recruited from the lower walks of life, instances are not wanting in which men of education and social position have resorted to this method of gaining a livelihood. One society of thieves which terrorized Mayence, in Germany, for several years, was led by an ex-priest, while the "Habits Noirs," or evening-dress gang, of Paris, was composed of persons of excellent social standing, who had met with financial reverses. In 1837 the authorities of Rome discovered and broke up an organized criminal society, many of the members of which were connected with the noble families of Italy. Among those arrested were Count Dionisi de Traja and the Countess Angellucci de Traja, as well as sev-

eral members of the Pope's bodyguard, all of whom had been long esteemed as persons of an exemplary character. France has often been at the mercy of such criminal societies, and there is reason to believe that crime clubs exist at the present time.

In 1849 the Thiberts were disbanded, after they had been successful in pursuing all kinds of criminal operations. This association, which numbered more than 800 members, was composed of every variety of criminal, all working, in perfect harmony, under one director. What one branch could not do, another accomplished, and there was no phase of crime which could not be undertaken. The disbandment of the Thiberts, however, was the signal for the organization of other associations along similar lines, and many of these societies were made up of seemingly harmless folk, men and women who lived in apparent respectability, or members of the same family who pursued their careers of crime under the direction of one of their number. Such a man was Hippolyte Villet, the leader of the Lamaire band, whose crimes remained unchecked from 1852 to 1855, when the criminals were exposed, and compelled to pay the penalty of their murders and robberies on the gallows.

An instance of organized criminal effort was exposed by the police in Paris in 1888. This association, known as the Catusse-Menegant, was one of the greatest of modern bands of criminals, for, while it was under the direction of two men, located in Paris, its lines extended into every part of Europe. Everywhere it had its agents, bands of pickpockets, horse stealers, housebreakers, confidence men and swindlers of every character. In addition to this it operated a banking house in London, through which it was a simple matter to negotiate its stolen stocks and bonds, or to dispose of its silver and gold. With such facilities the operations of the society were naturally enormous, and were only exposed at last through the clever work of the French detectives, assisted by officers from Scotland Yard. The real leader of the Catusse-Menegant was a man named Chambon, who, under the name of Victor Chevalier, lived with his wife in the Rue Poteau. To all appearances his sole business was that of conducting a livery stable. His arrest, and that of his lieutenants, was soon followed by confessions which enabled the police to arrest many other members of the association. They were found in all parts of Europe, and in almost every grade of society, but the evidence against them was so complete that nearly all were convicted and sentenced to more or less lengthy terms of imprisonment.

The "System," in New York, may be looked upon as the last modern criminal association in America. It was an alliance between certain gangs and gang leaders, with corrupt politicians and corrupt members of the police force. It met its death through the efforts of Charles S. Whitman, then district attorney of New York, who convicted Lieutenant Becker, a high police official, with the murder of a gambler who disobeyed orders. Becker and his agents were electrocuted, Whitman was rewarded by being made governor of New York State, and the system received its death blow.

SOCIETIES FOR ETHICAL CULTURE. See ETHICAL MOVEMENT AND ETHICAL SOCIETIES IN AMERICA AND ABROAD.

SOCIETY OF AMERICAN ARTISTS, an association of painters and sculptors in New York City, founded in 1877. Its membership included the leading artists in the country, and during 29 years the society was a considerable factor in the advance of art ideals in the nation. Nearly all its members being identified with the National Academy of Design, it was considered wise to merge interests and prizes with that organization in 1906, when it became affiliated with Columbia University and the Metropolitan Museum of Arts. See NATIONAL ACADEMY OF DESIGN.

SOCIETY OF CAMORRA. See SOCIETIES, CRIMINAL.

SOCIETY OF THE DIVINE SAVIOUR. See ORDERS, RELIGIOUS.

SOCIETY OF THE DIVINE WORD. See ORDERS, RELIGIOUS.

SOCIETY FOR ELECTRICAL DEVELOPMENT, an association organized in 1912 to carry out in a broad way co-operative electrical development between the various branches of the industry and the larger electrical companies. The headquarters are at 29 W. 39th street, New York, and the membership is 1,300.

SOCIETY OF THE EPIPHANY. See ORDERS, RELIGIOUS.

SOCIETY OF THE FAITHFUL COMPANIONS OF JESUS. See ORDERS, RELIGIOUS.

SOCIETY ISLANDS (TAHITI), South Pacific Ocean, a French dependency, between the Low Islands and the Friendly Islands. This is the largest group of the Leeward Islands, and consists of the principal island of Tahiti (q.v.) or Otaheite, which is about 32 miles long northwest to southeast, and is divided into two peninsulas by an isthmus about three miles broad; and a great number of comparatively small islands, of which the most deserving of notice are Eimeo or Moorea, Maitea, Tetuaroa, Maiaoiti or Saunders Island, Tahaa or Otaha, Marua or Maupiti, Tubai or Motu-Iti, Huaheine, Raiatea or Ulietea- and Bora-Bora. The islands are of rugged surface and conical form, encircled by coral reefs. Sharp peaks usually rise midway in the islands from a low band lining the shores and blooming with groves and orchards. The wooded mountainous slopes are intersected with valleys watered by rapid streams often falling in steep cascades over the rocks. The locality is of great geologic interest, the volcanic rocks being exceptional. Coral beds are found high up on the mountain sides and many curious lava formations. The highest point is on Tahiti, 7,349 feet. The scenery is idyllic, especially in Eimeo. The coasts contain safe and commodious harbors, the best in Polynesia. The climate, though extremely hot and damp, is healthful. Cotton and sugar, sweet potatoes, bread-fruit and taro are grown, and all kinds of tropical fruits—cocoanuts, vanilla and oranges. The exports include these, to-

gether with trepang, cocoanut fibre and mother-of-pearl. The imports are flour, wine, sugar, coffee, soap, timber and livestock, besides manufactured goods. Prior to their contact with Europeans, the people were naïve and ingenuous; thus Captain Cook found them and interested English missionaries in their welfare, who were successful in Christianizing them. The islands were discovered by a Spanish navigator in 1606 and were visited by English and French travelers and scientists, and finally ceded their independence to the French, becoming a colony in 1880. The capital and harbor of the group is Peete, on the island of Tahiti. Its chief buildings are a Roman Catholic cathedral, some schools and an arsenal. The people are of Polynesian extraction and famous as presenting a perfect type of face and form. In 1904 a violent storm brought disaster to the group, depopulating some islands and causing much suffering and destitution. Area, 600 square miles. Pop. about 18,000.

SOCIETY OF JESUS. See JESUITS.

SOCIETY OF THE MAFIA. See SOCIETIES, CRIMINAL.

SOCIETY OF MARY OF PARIS. See ORDERS, RELIGIOUS.

SOCIETY OF NAVAL ARCHITECTS AND MARINE ENGINEERS, an organization founded in 1893 to promote practical and scientific knowledge in the art of shipbuilding and marine engineering and the allied professions. In furtherance of this object, annual meetings are held for the reading and discussion of appropriate papers and for the interchange of professional ideas, thus making it possible to combine the results of experience and research on the part of shipbuilders, marine engineers, naval officers, yachtsmen and those skilled in producing the material from which ships are built and equipped. The knowledge thus obtained is circulated by means of the annual publication of the 'Transactions of the Society.'

The society consists of members, associates, juniors, honorary members and honorary associates. The members' class consists exclusively of naval architects, marine and mechanical engineers, including professors of naval architecture or mechanical engineering in colleges of established reputation, who are not under 25 years of age, and who have been engaged in professional practice in a responsible capacity for at least three years. The society has a total membership of 1,000. The head office is at 29 W. 39th street, New York.

SOCIETY FOR PROMOTION OF USEFUL GIVING. This was founded in New York City in 1912, and has a membership of about 10,000. Its headquarters are at 38 W. 39th street; Mrs. August Belmont is president and Miss W. K. Oliver secretary.

SOCIETY FOR PSYCHICAL RESEARCH. See PSYCHICAL RESEARCH.

SOCIETY OF SAINT JOHN THE EVANGELIST. See ORDERS, RELIGIOUS.

SOCIETY OF SAINT VINCENT DE PAUL, a Roman Catholic charitable organization, founded in May 1833, in Paris, by Frederick Ozanam (q.v.) and seven companions. At their first meeting the object of the society

was outlined and expressed in the few words: "Our work shall be for the service of God in the persons of the poor, whom we are to visit at their own dwellings and assist by every means in our power." Frederick Ozanam is considered the founder, as he was the first one who suggested the work. The Saint Simonians had taunted the young men who were advocates of Roman Catholic doctrines with being talkers only and not workers. At the very next meeting of Ozanam and his friends, Ozanam suggested an organization which should occupy itself "not with discussions but with good works."

From a membership of eight in a small room in Paris, in 1833, the society has grown to a membership of thousands with local organizations in nearly all parts of the world. The first United States society was formed at Saint Louis in 1845; the New York organization dates from 1846. The members are men from all stations in life. There are numerous auxiliary societies, composed of women, who assist in the regular work of the Saint Vincent de Paul societies. The instructions given by the Père Bailly at the first meeting created a spirit which is characteristic of the work of the present. He urged the men not to let their work be a "mere doling out of alms," giving only a pittance of money or food, but a medium of moral improvement through personal service. Their education, intelligence, special knowledge of science and their general knowledge of life are placed at the service of those needing assistance.

The total number of Saint Vincent de Paul conferences throughout the world is over 6,000; active members over 100,000; honorary members, over 100,000. There are now branches in every civilized country on the globe. There are in the United States a general council, and special councils in every archdiocese, besides 800 conferences and over 15,000 members.

Some of the good works in which the members are engaged are visiting the sick and those in trouble; furnishing food and clothing to the needy, procuring employment for those not engaged in regular work, providing summer country homes for poor city children and homes for the homeless. The members visit the jails, prisons, almshouses and the poor of the parish. Boys' clubs have been established in many cities, and vigorous efforts are made to distribute good literature. Besides the local meetings, State and national meetings are held annually, with delegates from conferences in all parts of the United States, Canada and other countries. All the councils of the world report annually to the council-general, who has his headquarters in Paris, France. Consult 'Manual' of the society.

SOCIETY OF TAMMANY, or COLUMBIAN ORDER. See TAMMANY SOCIETY.

SOCINIANS, sō-sīn'ī-ānz. See RELIGIOUS SECTS.

SOCINUS, sō-sī'nūs, **Faustus,** Italian theologian; nephew of Lælius Socinus: b. Siena, 1539; d. Poland, 1604. Having lost his parents while still young his education was neglected. He was obliged to leave Siena from suspicions of his entertaining heretical notions in his 20th year, and retired to Lyons. On the death of his uncle he came into possession of the manuscripts of the latter, by the study of which he

found his former opinions confirmed. He began to publish his views at Florence (where he lived 12 years at the court of the grand duke, Francesco de' Medici) in anonymous writings; and he afterward retired to Basel to avoid the persecutions of the Italian inquisition. His opinions were still more fully developed during a residence in Transylvania, and in Poland he had numerous adherents. The Anti-Trinitarian societies, although they agreed with him in some points of doctrine, yet differed so far in others that they would not receive him into their communion. He formed, however, some small societies of followers there, but suffered persecution in that country, and the confiscation of his property in Italy. His death was hastened by the brutal treatment of a fanatical Cracovian mob. Those who followed the teachings of Lælius and Faustus were termed Socinians, and their theories persisted, finally culminating in modern Unitarianism.

SOCINUS, Lælius, Italian theologian: b. Siena, 1525; d. Zurich, 1562. He was destined for the legal profession, in which his father, Mariano, and several others of his ancestors, had gained distinction; but, moved by the religious discussions which then agitated the greater part of Europe, he abandoned the science of jurisprudence for the study of the Scriptures. In order to prosecute his study thoroughly he mastered the Greek, Hebrew and Arabic languages. In 1546 he was admitted a member of a secret society at Vicenza, which had been formed for the discussion of religious questions. They soon arrived at the conclusion that the doctrine of the Trinity was untenable, and that many of the dogmas of the Catholic Church were repugnant to reason, which they held to be the only court of appeal in matters of religion. The nature of their deliberations having become known the society was broken up, several of its members were arrested and put to death, and others, among whom was Socinus, left the country.

He visited France, England and Holland, and resided for some time in Switzerland, Germany and Poland, where he found many persons who were in sympathy with his views. He is the author of 'Dialogus inter Calvinum et Vaticanum,' 'De Sacramentis,' 'De Resurrectione Corporum,' and several unfinished works, which he bequeathed to his nephew, Faustus.

SOCIOLOGY. The following exposition does not attempt to mediate between the numerous claimants to the name "Sociology." It frankly applies the name to the attempts to establish a division of knowledge co-ordinate in dignity with the older social sciences. It indicates the actual growth and present character of sociology, especially in recent years in the United States, as the subject is understood by such a representative body as The American Sociological Society. (Consult Proceedings, Vols. I-XIII).

Definition.—Sociology is primarily one of the many techniques which make up the equipment of social science as a whole. In the second place, each of these techniques is a growing body of knowledge arranged and interpreted according to the respective special standards, and each in turn is a more or less explicit body of conclusions about the bearing of the respective findings upon contemporary problems both of

interpretation and of control. Chief among the other techniques for scientific dealing with social relations are psychology, anthropology, ethnology, comparative philology, history, political economy, political science and statistics. The task of social science in general, or the co-operation of these techniques, is to make human phenomena intelligible, and eventually as far as possible controllable. This task involves determination of the norm or norms according to which control should be exercised. *The sociological technique is that variant among the social science techniques which proceeds from the perception that, after allowing for their purely physical relations, all human phenomena are functions not only of persons, but of persons whose personality on the one hand expresses itself in part through the formation of groups, and on the other hand is in part produced through the influence of groups. In brief, sociology is that technique which approaches knowledge of human experience as a whole through investigation of group-aspects of the phenomena.*

In order to understand the place of sociology in the whole apparatus of knowledge, it is necessary to become familiar with the fact that the growth of the "social sciences" since 1800 has been essentially the evolution of a single scientific method, a method which, while becoming more specialized and diversified on the one hand, is becoming both more unified and more comprehensive on the other. At the same time it is assembling a more and more coherent body of knowledge and interpretation. The outcome has been not that the different divisions of social science are more isolated from one another than in 1800, but that the best work in each is certain to show effects of contact with all. This is not the traditional view. Until recently the almost universal opinion among social scientists was that the 19th century was an era of the development of many independent sciences of human life. It is not an excursus from our subject, therefore, but a necessary introduction to the most mature views of the subject, to dwell at some length upon our radical proposition.

History.—The problem of knowledge in the field of social science reduces to this: *What is the meaning of human experience, and to what extent have we developed a technique which may be relied upon to ascertain more of that meaning?* To explain the origins of sociology, we must answer the question, What has social science in general done toward working out a reliable method of interpreting human experience? (Consult Small, 'The Meaning of Social Science'). If this question were answered in full it would include an account of the evolution of philosophy and psychology since Locke in England, since Descartes in France, since Wolff in Germany. We may merely summarize to the effect that modern philosophy and psychology have found common ground with all positive science in the commonplace that all convincing interpretation of experience must be generalization of experiences. To this commonplace we may add the proposition which is not equally trite, which experience is nevertheless steadily enforcing, viz., that valid social science cannot be many; it must be one.

Sociology made its appearance as an Ameri-

can pursuit in 1883. For several decades American sociologists consecrated far more ingenuity and passion to propaganda of the conception that sociology is, was and ever shall be an independent science, than to search into its actual origins, and to analysis of its necessary inter-relations. In this the earlier sociologists exhibited their intellectual consanguinity with most of their scholastic predecessors and contemporaries. Like so many other zealots for the advancement of knowledge, they proclaimed themselves the high priests of an independent cult, to which independent cult, however, as they often declared in the same breath, all other scientific cults must one day become subordinate. Even now this earlier misconception survives among social scientists, sociologists not excepted. In order therefore to indicate the historical relations between so much of our technique as we have thus far developed and the other techniques for investigating human experience, we must present sociology as it evolved with and out of the totality of 19th century social science.

Until now the thoughts of the vast majority of men about human experience, past or present, have been mostly nebulous, mystical, irresponsible. People in general, even including those who passed as scholars, have been content to accept versions of human experience without inquiring closely into the credibility or the sufficiency of the evidence in support of the versions, or into the conclusiveness of the inferences drawn from the evidence. On or about 1800 a movement began to be manifest among European scholars which, like most movements that later prove to be momentous, probably did not at once disclose a large fraction of its significance to many of its promoters. The date 1800 is selected for symbolic convenience. It is at the centre of events which fall within a zone occupying 25 years on either side. From the present outlook the meaning of the movement is more evident than it could have been to the men whose gradual coming-to-consciousness was the making of the movement. We embrace its entire sweep, in all dimensions, from 1800 until now, in the formula: *It was a drive toward objectivity.* For the purposes of this sketch we may define the term "objectivity" as requisition that nothing shall be allowed to pass as knowledge until in every conceivable respect it literally reflects reality. Previous to 1800, except within relatively immediate ranges of experience, that which passed as social science, under whatever name, as a rule pitifully failed to satisfy this standard. Before one-third of the 19th century had passed, European scholars in each of the then conventional divisions of social science had betrayed prophetic discontent with the existing state of knowledge in their fields, and with the current methods of search for more knowledge. They had begun to make out ways and means of making knowledge within their respective fields both more ample and more accurate. In the light of our experience meanwhile, we are accredited by the facts when we say that this discontent and this resolve presently amounted to a *concerted drive toward objectivity* in social science. Historians, economists, professors of jurisprudence were not discontented with precisely the same things in their respective divisions of labor, nor with

precisely the same things which were regretted in one another's fields. They did not propose identical means of removing the obstructions of which they were severally conscious. We may anticipate the most obvious conclusions which our survey will impress, however, by pointing out that, in effect if not in professed program, the detached, provincial, unco-ordinated, uncorrelated scholarship in the social science of the year 1800 has become the comparatively organic scholarship of to-day. By organic, in this connection, we mean reciprocally reinforcing. There were counter-marches here and there during the 19th century, toward such specialism and isolation in research as would have threatened to reverse the movement toward objectivity. These counter-marches were not simultaneous in all countries nor in all sciences; and they did not long continue their drift toward earlier sterility. On the contrary, in spite of all the caste spirit among scholars, social science in its various divisions has become more and more interpenetrating. Since 1800 there has been on the whole an accelerated process of reciprocal assimilation of ideas between all the different departments of knowledge within the range of social science, not to speak of reciprocal modifications between physical and social science.

Priority of mention, as promoters of the drive toward objectivity, belongs to the historians. While consciousness of the past as having been, and as having had some sort of meaning for the present, had been a factor time out of mind in the thinking of both learned and unlearned, that which was accepted as history previous to 1800 was often more imaginative than authentic. Soon after 1800, the work of devising means of discriminating between false and true, between adequate and inadequate evidence, and so between trustworthy and untrustworthy reconstructions of the past, was in full swing. The technique by which the historians began to discredit previous credulity soon became known as "critical" methods, or as "historical criticism." In his account of a type of historical or quasi-historical thinking which critical history has been trying to displace, Robert Flint schedules certain conditions, physical as well as mental, without which adequate historical interpretation is impossible ('The Philosophy of History in France and Germany,' 1st ed., 1874. Introduction). The conditions named are, first, a certain actual world-unity, such as was realized by the Roman Empire; second, a certain consciousness of spiritual unity, such as was introduced by Christianity; third, the idea of progress; fourth, the idea of freedom. It is somewhat more obvious, on the one hand that modern sociology is inconceivable in the absence of certain additional ideas to which the early 19th century historians gave currency, and on the other hand that the failure of these historians to make the most intensive use of these ideas operated as a challenge to certain thinkers to develop the suggestions until they became tools of the technique called sociology. Thus the conception of *continuity* in human institutions (Savigny, Roman law in the Middle Ages); the conception of the *multiplicity of factors* operating in historical combination and sequence (Eichhorn, German civic and legal history); the *necessity of sub-*

jecting alleged historical evidence to the severest scrutiny (Niebuhr, early Roman history); the value of *documentation* as a basis for historical opinion (Ranke, ecclesiastical and political archives, principally of the Reformation and post-Reformation periods). Whether the sociologists have made more or less use, better or worse use of these ideas than the historians did is aside from the present point. The sociologists took over from the historians these ideas and others of more particular types, and employed them in distinctive ways. As the historians developed critical methods to higher and higher degrees of precision, sociologists became aware that the same methods, or equally penetrating methods, must be used for them by historians, or by themselves, whenever the tasks which the sociologists undertook required historical research.

Turning to another antecedent of sociology, if we trace political economy no farther back than the Physiocrats in France, or Adam Smith in England, it antedates these beginnings of critical history. In effect, however, political economy did not become an appreciable driving force in the thrust toward objectivity until the historians were well in the lead. At this point we are considering the development of political economy solely with reference to the question, What relation did political economy have to the differentiation of sociology? The substantial fact in reply to that question is that the economists were the first type of scholars to undertake the task of carrying through a completely objective analysis of what takes place in a selected human group, and of finding out why it takes place. They did not do this in a completely objective way from the beginning. They tried to, nevertheless. In making the attempt they not only from time to time devised improvements in their own methods of closing in on their aim, but they struck out suggestions of inquiry into what occurs in other kinds of groups than the economic. Both directly and indirectly they cleared the way for an enlargement of their field of operations in the directions presently followed by the sociologists. Just as the economists implicitly raised and tried to answer the question, What are the actual phenomena of cause and effect within the whole range of economic groupings? so a little later the sociologists began to feel the urge of the related questions, What are the actual phenomena of cause and effect throughout the whole range of human groupings, in other words throughout the whole range of human society?

In certain respects, as far as it affects sociology, the outcome of the British move toward objectivity associated with the names of Adam Smith, Ricardo and Malthus is more evident in the German than in the British succession. At the close of the 18th century German thinking about economic relations had reached a dead centre. German ideas had been temporarily stabilized by "cameralism," a peculiar and highly developed body of theory about every phase of action within the state. (Consult Small, 'The Cameralists'). This system of ideas and of practice had been developing since 1555. It did not correspond in its subdivisions with later academic definitions of the social sciences. It started not as general theory

but as formulation of administrative expediency. It set forth with the frank purpose of subordinating everything within the control of the state to the state's problem of existence. The central question to which cameralism elaborated answers was: The ruler being all-powerful over his territories and his subjects, what policies, and what details of practice in pursuance of the policies must he adopt, in order to make his rule most secure at home, and in order to provide most abundant means of asserting himself against other rulers? It would require but little reflection to prepare against surprise at what happened. Under the circumstances of the time, this question necessarily led to answers which amounted to prescribed programs covering the entire outward life of the subjects of German rulers. It soon became evident to the advisers of those rulers, and to the administrators of their states, that their problem involved not merely physical factors, but that it was a question of training the whole population for all the different sorts of useful work of which human beings are capable. From generation to generation the men who developed cameralistic theory and practice saw more and more clearly that if the rulers of German states were to command abundant resources, they must rule over resourceful people. This meant that the people must be trained physically, mentally, morally and technically. In the end, therefore, cameralistic theory covered everything in the lives of the citizens, from farm work to religious worship. The machinery for administering this theory grew more and more complex. In detail its organization differed in one state from that in another. Its main purpose was everywhere the same, viz., to make the people as amenable as possible to all the discipline necessary to insure maximum performance of all the physical, mental and moral processes tributary to the strength of the ruler.

It need not be pointed out that this program involved dealing, from this special point of view, with every sort of activity which has since come under the attention of political science and political economy in their latest forms. In so far as cameralism dealt with economic questions in the later sense, it treated them as matters primarily of the state, not of individuals. German economic theory, therefore, was collectivistic in the highest degree. Only incidentally, and in a wholly subordinate degree, was it individualistic. It was a theory of, for and by the government.

This cameralistic system contained the germs of all subsequent German administrative theory, and suggestions of much that was later developed into fundamental economic doctrine. Its centre of attention may be said to have occupied its original prominence only to the time of Sonnenfels (1765). From that date until the third decade of the 19th century there was an interim of barrenness in German economic thinking. This was in spite of the fact that an occasional book of some merit was produced; for example, Büsch, of Hamburg, on the circulation of money ('Geldumlauf').

The one point of departure from which it is possible to get a true view of the development of economic theory in Germany is that the first half century of German political econ-

omy was essentially not German at all; it was English. This period falls roughly within the dates 1820-70. During all this time the German economists were unconsciously breaking with all the national precedents for their particular kinds of work, and were trying to do a radically un-German thing. They were first of all doing their best, in their own division of labor, to substitute objectivity for fragmentary knowledge and premature conclusions, but they were trying to do it in an English way. They were not merely trying to graft an English branch upon a German tree. They were trying to make English roots grow in German soil, and bear more abundant and useful fruits than native stocks. If they had succeeded, the English roots would have driven out German roots. German controlling economic ideas would have changed from collectivistic to individualistic.

This fact goes far toward resolving the confusion of German economic theorizing between 1820 and 1870. During all this time the economic group of German thinkers were in dead earnest in their drive after objectivity, but the pass-key to their procedure is that the prevailing spirits among them were all the while trying to naturalize strange gods. For the theoretical and practical state-collectivism which reached its culmination in the theory and practice of Frederick the Great in Prussia and Maria Theresa in Austria, they tried to substitute the so-called theory of "economic liberalism," or "economic determinism." Whichever of these two variants of an identical underlying conception was most prominent in specific cases, it relegated the state very largely to a passive or negative rôle, and it made individual initiative paramount. In short, the economic theorizing which held the centre of the stage in Germany between 1820 and 1870 was violently un-German in its presuppositions. It was that unfortunate excerpt from Adam Smithism which passed by way of Ricardo into circulation as the "science" of political economy; and in German hands its implications were worked out to a degree of refinement never surpassed and hardly equalled in England.

If space permitted, it would be illuminating to cite particulars in which the classical economists, both in England and in Germany, by what amounted to a trial and error process, tested every conceivable way of accommodating facts to the classical presuppositions. With each variation of the attempt they confirmed convictions which later transformed certain men into sociologists. (For example, List and the entire "Zollverein" movement, about 1840; the so-called "Historical School," Roscher, Knies, about 1850; Prince-Smith and the "Manchesterists" of the Volkswirtschaftlicher Kongress, about 1860; the "Austrian School," Carl Menger, Böhm-Bawerk, about 1870; the professional socialists, or the Ethical School, Schmoller, Wagner, Verein für Socialpolitik, about 1870; the "Sociological School," to be mentioned later, about 1880). As each contending sub-hypothesis under the leading assumptions failed to vindicate itself as the one missing clue to the mystery of economic relations, the certainty was approaching that some one would see in these failures the fact that economic groups are not effects of single causes but of multiple causation; that economic

groups do not exist in a vacuum; that they are affected by some of the same influences which work in other groups, some of which influences are transmitted from other groups to economic groups, and are sometimes more decisive for economic groups than so-called economic factors proper. It was a foregone conclusion that when these observations were made on the basis of the experience of economists, they would stimulate someone to experiment with a new apparatus of group-analysis. This probability was confirmed in the case of some of the sociologists.

We may indicate this factor in the evolution as follows: Judged by subsequent events, and expressed in the most summary form, political economy became a forerunner of sociology because, however defined and however conducted, political economy devoted itself more and more effectively to critical analysis of that portion of social phenomena which seemed to the economists to fall within their appropriate field of view. Regardless of the question which had to be reconsidered over and over again, as to the validity of their ideas about their special field, and regardless too of the specific facts which they collected, and of the peculiar doctrines which the various theorists derived from the facts, by the very refinements of analysis through which they attempted to get at all the meanings of their phenomena the economists set a pace, and furnished suggestions for imitation, which could not have remained without influence upon other men who were interested in other species of group phenomena. Simply because the type of human group which forms "the market," whether in the most generalized or in the most localized sense, is only one of myriads of types of human groupings, it was only a question of time when there would be imitators of the economists who would devise ways of applying equally searching analysis to many types of human activities not primarily and immediately, at all events not exclusively and finally activities of the market. This then is the main aspect in which the evolution of economic thinking since 1800 concerns sociology. In a word, it seems to have been necessary that a type of thinkers should have been developed who had become keen for analysis of the operations of the market; and as we shall observe in the next paragraph, another type keen for analysis of men's actions under the political and legal aspects, before a type of scholars could develop with ability to perceive that men are not fully analyzed when they have been thought of only under the economic, the political and the legal aspects. In fact, the sociologists were recruited very generally from either the historical, the economic or the political faculties. Our main thesis at this particular stage of the exposition is that the economists prepared the way for the sociologists, and partly assured their coming, by working out an apparatus for objective exhibit of economic processes as they really are. In so far as the sociologists derived immediately from the economists, it was by cherishing the spirit of group-analysis, and by turning this animus to application upon other than economic groups.

Even before the middle of the 18th century, there were among the cameralists writers who seem to have been almost within sight of the

beginnings of sociology in the present sense. Examples are Gerhard, 1713, and Zincke, 1742. (Consult Small, 'The Cameralists,' pp. 175 and 249). The most effective prospecting for a future sociology however was done in Germany, at about the middle of the 19th century, by a series of political scientists. These men seem to have had very little to do with one another, and we do not know whether they were actuated by impulses received from a common source. Several of them, at all events, hit upon a similar if not an identical problem, and it was in substance the same problem with which the men in Germany, England and the United States who called themselves sociologists began their work 20 or more years later. Von Mohl, one of the most notable of these pre-sociologists, reviews the movement and furnishes a bibliography of it as it had developed up to 1855. ('Geschichte und Literatur der Staatswissenschaften,' Vol. I, pp. 69-110). Von Mohl is himself typical of this movement at its best, and we may use him as the most available index of its character. The very title of his first chapter affects an American sociologist as a generation ahead of its time. It reads: "The Sciences of the State and the Sciences of Society" ("Die Staatswissenschaften und die Gesellschaftswissenschaften"). The contents of the chapter confirm the impression of modernness. It turns out that the author was in the bonds of that mystical conception of the state from which the Germans are not yet delivered, and he placed in antithesis with the state an equally mystical concept "society"; yet his challenge to analyze the concepts "state" and "society" might very well be celebrated as one of the beginnings of sociology. He proceeds after this fashion: "Only recently have we come to the clear conception that the community life of men is by no means exhausted by life in the state, but that between the sphere of the individual personality and of the organized unity of popular life there is a collection of intermediate life phenomena which also have community objects as their purpose, which do not have their origin from the state or through it, although they are in existence in it, and that these are of the highest significance for weal and woe. These two areas of thoughts and theories, which for more than two thousand years have seemed to be similar, or at most have been regarded as part and whole, have at length proved themselves to be essentially different, and must also be treated separately, so that in the future they will exist side by side, as distinguished but coequal divisions of human knowledge. . . . The science of society must now be founded and developed. In particular its limits with respect to the science of the state must be determined. This . . . not merely for society, but almost as much also for the state and the theory of the state. . . . Of independent works about society there is not a word in the older schools of philosophic writing down to the time of Kant. In this entire literature there is not a single work which has attempted to grasp in their essential nature the life circles outside of the purpose and organism of the state, and to think of them as a whole." Thereupon von Mohl names numerous books and monographs which began to appear after

1797 in Germany, and beginning with Montesquieu in France, which betrayed a certain disappointing appearance of having seen the need of a "science of society" in distinction from a science of the state. After noticing the type of writers on society whom he calls "essentially not social philosophers but social partisans" (Saint-Simon, Fourier, Robert Owen), and after referring to numerous political theorists who had been approaching the real problem as he saw it, of whom the most notable was Ahrens ('*Cour de droit naturel*,' 1837, and the maturer rendering of his peculiar idea in '*Die organische Staatslehre*,' 1850), von Mohl at some length outlines his own conception of the needed "science of society." This scheme is impossible, and need not be noticed further, except by way of repetition that it was an honest groping after the sociological problem which later emerged. Because of the attention which Americans have given to Treitschke as a prophet of German world-power, more than one kind of interest attaches to the fact that Treitschke's entrance upon his academic career was marked by his publication in 1859 of a monograph in which he claimed to have given its *reductio ad absurdum* to von Mohl's argument for a new science of society ('*Gesellschaftswissenschaft, ein kritischer Versuch*'). Treitschke discusses particularly the proposals of Ahrens and von Mohl. He asks whether it is really necessary, as such men contend, either completely to reconstruct political science or to create a new doctrine that shall totally displace it. He reaches his reply by inspecting in turn the groups which von Mohl had used as illustrations, and as to each of them he reaches virtually the opposite conclusion to that of von Mohl, viz., Treatment of this group belongs in political science, and can be adequately provided by political science. With the exception, however, of tribal and ethnic groups, certain economic strata ("Nähr-Wehr-und-Lehr Stand"), the educated and the uneducated, religious communities, "voluntary associations of all sorts," and the family, the groups which he considers are so obviously political that with reference to them the conclusion is not surprising. It was easy to show that each of the groups not primarily political has numerous and vital relations to the state. Nor was it difficult to make it appear to friends of an established cult who did not want a rival, that a rival would be superfluous. It was plausible that all the relations of these groups to the state could be treated best by the established "science of the state" and that facts about these groups which did not interest "the science of the state" were not worth scientific notice. There is a tone of assurance, therefore, in Treitschke's manner throughout the monograph which indicates his belief that he was forever laying the boggy of a "science of society." In fact, however, in order to reach his negative conclusion he had advertised the existence of groups which he named and others which he did not name. He had featured facts about these groups which could not be exhausted by political theory. We cannot prove that Treitschke's influence actually stimulated anyone to follow up the study of human groups. It is certain that he did not prevent such study,

and he unconsciously contributed to demonstration that it was needed.

While it is impossible, in the present state of our knowledge, to make out precisely how the circuit was at last closed between all these stimuli and the minds of the men who actually won a place in social science for a new method of investigation, it is easy to make out the period after which the sociological continuity was unbroken. It has been almost undisputed tradition among the sociologists that August Comte, who is supposed to have coined the word, is also the "founder" of sociology ('*Cours de Philosophie Positive*,' ed. of 1869, Vol. IV, pp. 185, 263 and 412. 1st ed. published 1839). Herbert Spencer began to be acquainted with Comte's philosophy in 1853-54, but he asserted that his only indebtedness to Comte, was "the indebtedness of antagonism" ('*Autobiography*,' Vol. I, p. 517). '*Preussische Jahrbücher*' (Vol. IV, 1859, p. 279), contains a very intelligent digest of the Comtean system, with the editorial note: "Our readers will be glad to be informed about a thinker who has hitherto been very little known in Germany." This note is confirmed by the fact that in the section in which he discusses the lack of analysis of society in French literature, von Mohl mentions Montesquieu and Rousseau, but does not name Comte ('*Geschichte und Literatur der Staatswissenschaften*' I, 76, 1855). It would be profitless to discuss the question whether Spencer in England or Schäffle in Germany would have been as successful as each was in launching a new method if Comte had never written. It is at all events beyond dispute that the publication of Spencer's plea, '*Study of Sociology*,' beginning in 1872, and the maturing of his '*Principles of Sociology*,' between the years 1874 and 1885, mark the permanent arrival of sociology in England and the United States. Schäffle's work in four volumes, '*Bau und Leben des sozialen Körpers*' (first vol., 1875, remaining three vols., 1878, 2d ed. 2 vols., 1896) bears a similar relation to sociology in Germany. We had reference above to Schäffle and his followers when we referred to "the sociological school" of German economists. In his textbook on political economy, published in 1861, Schäffle had begun to exert a modifying influence, from the standpoint which he afterward located more precisely, upon prevailing economic theory. The second edition of this book (1867) and the third (1873) bore the title, '*The Society System of Human Economy*' ('*Das gesellschaftliche System der menschlichen Wirtschaft*'). In the light of later developments it reads like the author's involuntary warning of his approaching secession.

This historical survey would be misleading if it left the impression that the impulses which converged at the points just indicated, and which, as we shall see, spread from these points as rapidly expanding programs, were driven exclusively by the scientific interest. It may be that sentimental philanthropic impulses did more than the strictly scientific temper to bring sociology into existence. Here are to be cited men, first, of the Rousseau-Diderot succession, then of the type of St. Simon (1760-1825) and Fourier (1772-1837), in France; such theorists as the Utilitarians, from Bentham to John

Stuart Mill, then such as Robert Owen, Ruskin, Maurice, Kingsley and Robertson in England; the socialists of all countries, the advocates of "social policy" (Verein für Socialpolitik) in Germany; a group of earnest so-called "social scientists" and especially certain types of philanthropists in the United States, who industriously advocated "the improvement of social conditions." Presently the activities of this latter type of people became conclusive proof to other types of people that there was sore need of more searching study into social conditions. This conviction enlisted its quota for sociological research in the scientific sense. (Consult Small, 'General Sociology,' pp. 36 sq., and Small, 'Fifty Years of Sociology in the United States,' *American Journal of Sociology*, Vol. XXI, pp. 721-864). For striking evidence of the way in which these philanthropists affected one of the men who later had a conspicuous part in developing general sociology consult Sumner, 'What Social Classes Owe to Each Other' (1883).

Description.—Since we have seen how sociology got a name and a place, the question remains, What sort of a thing is this that is so named and placed? The only valid answer is still essentially historical. From the time of Spencer and Schäffle sociology has been more a steadily developing mode of thinking than an entity conforming to a statical description. This is almost equally true of the more strictly generalizing type of sociology characterized in our original formula, and of the numerous techniques for concrete application of scientific knowledge which also use the name sociology. Confining ourselves now to the former, the early sociologists felt a woe-is-me if they did not succeed in getting a vision of human society as a whole. Instead of feeling satisfaction with the conventions of social science, they were impressed with the futility of everything that had been accepted so far as scientific exposition of human experience. Comte's dictum that the root of evil in the European world was the "anarchy of fundamental ideas," might have been chosen as their slogan. They were convinced that the only way of removing the confusion in men's minds about social relations must be *achievement of a controlling conception of human society in its entirety*. Without apparent hesitation about the chances of convincing the world, they gave themselves to the task of framing a conception that would be justified by the facts. With differences of detail they believed that human society the world over, past, present and future, makes up some sort of a unity. They believed that parts of this whole, or incidents within the operations of this whole, are to be understood only as they are assigned to their actual places and connections subordinate to the whole. All the variations which have become parts of the main tendency of sociological theory since 1875 have started from some form of this presumption. At the time when this tendency entered upon its permanent course the most potent reconstructive factor in all science was Darwinian biology. It would have been wonderful if the attempts to visualize society in all its dimensions had not come under this virile influence. In fact, they were not only influenced but they were over-

influenced. Until well into the 20th century the strength of the sociologists was very largely applied, first, to debate with one another and with social scientists of the older types about classification of the sciences, and about claims between these older possessors and the sociological intruders to equities in scientific territory; second, to elaboration, attack upon and defense of schemes to exhibit the wholeness and the operations of human society as an *organism*, analogous with biological organisms.

A curious case under the first head is a monograph of 80 pages published in 1903 as a part of the Twentieth Annual Report of the Bureau of American Ethnology. When the monograph was written its author, J. W. Powell, was director of the bureau. The title reads: 'Sociology, or The Science of Institutions.' Major Powell says (p. ix): "I classify the sciences of sociology as *statistics, economics, civics, historic and ethics*, . . . my purpose being classification only, . . . pleasure, welfare, justice, expression and opinion are concomitant; one cannot exist without the other, hence there can be no sociology without *esthetology, technology, philology and sophiology*."

Under the second head, the schemes of Spencer and Schäffle were essentially similar. They were structures purporting to comprehend all societary relationships as analogues of the structure and functions of physical organisms. On the whole, all of the men who approached the problem in the same way (Lilienfeld, Fouillee, Isolet, Worms, etc.) merely proposed shadings of detail in the conception. Although American sociologists as a rule have regarded the conception as more useful pedagogically than scientifically, and although use of biological analogies in either sense has rapidly lost favor, progress of sociology toward academic recognition, both in Europe and the United States, has been seriously embarrassed by the widely prevalent impression, among other misconceptions, that sociology is merely a name for amateurish dallying with remote and imperfect likenesses between physiological and social relations. While the sociological division in the drive toward objectivity in social science was in danger of exhausting itself in attempts to resolve human experience into symbolic or literal biology, a powerful corrective was introduced into American thinking by the publication of Lester F. Ward's 'Dynamic Sociology' (1883; 2d ed., 1897, identical with the first, except that a new introduction reviews the progress of sociology to date. Ward's "mental autobiography," 'Glimpses of the Cosmos,' Vol. III, pp. 146 sq., contains an illuminating account of the incubation of the book, from 1869, especially of its relations to Comte and Spencer). For nearly a decade the work seemed to have been still-born. Then scattered signs began to appear that it was making its way. Ward was by profession a botanist. He was an unhesitating evolutionist. Combined with the novelty of much in the book, these two facts gave it significance. Herbert Spencer's rendering of evolution, especially as he was understood to carry it out in his system of sociology and in his *laissez faire* dogmas in politics and economics, went far toward establishing the belief that evolutionism and me-

chanical fatalism are identical. Ward was the first physical scientist to get a hearing for the contradictory doctrine that evolution ascended one step in the scale with the differentiation of mind: and that it foreshadows the ultimate control of physical forces by psychic forces. Although the further significance of the book was not recognized at once, it virtually called for the transformation of sociology into social psychology. While Ward's psychological method was impossible, he heartened American sociologists to assume at once an affirmative answer to the question which has not ceased to embarrass British sociology, as to whether evolution would permit any reckoning upon mental influences at all. In fact, with all their differences of detail, from the time that a few Americans began to call themselves sociologists they were practically of one accord in the belief that the distinctive and decisive trait in human society is that it is somehow or other a play of mental factors. At the same time Ward was a conspicuous illustration of a crudity, not yet entirely outgrown by sociologists, which was common to all the earlier social scientists of the generalizing types. Each of them more or less consciously cherished an ideal of a complete system of social science, in most cases to be called by the name of the respective dreamer's division of social science. This version projected a structure of knowledge in which there would be a place for everything of importance in human affairs, and in which everything of importance would have been fitted into its place; a scheme of mental architecture which should faithfully reflect the totality of human experience. Each of the philosophies of history, Comte's "positive philosophy," Spencer's "synthetic philosophy," and John Fiske's "cosmic philosophy" illustrates the general proclivity. Ward's system was primarily a cosmic philosophy, and his sociology was a more particular account of mundane processes within this entire planetary order. The best conspectus available of American, and to a certain extent of European sociological opinion while this type of thinking had not yet surrendered to influences which were already potent within it, is afforded by a series of papers read at the Saint Louis Congress of Arts and Sciences in 1904. Consult Proceedings, Vol. V, pp. 787-888; Giddings, 'Concepts and Methods of Sociology'; Vincent, 'The Development of Sociology'; Ratzenhofer, 'The Problems of Sociology'; Tönnies, 'The Present Problems of Social Structure'; Ward, 'Evolution of Social Structure'; Thomas, 'The Province of Social Psychology'; Ross, 'The Present Problems of Social Psychology.' Practical aspects of social theory at the same period are set forth in Vol. VII of the Proceedings.

We have implied that the Saint Louis Congress marked a stage in the development of sociology. The chief variant which rapidly gained influence in sociological ways of thinking after that point, may be characterized in general as a tendency to diminish attention to structural aspects of social relations and to increase attention to functional phenomena. The predominance of statical views in sociology had always retarded development of dynamic conceptions which were implicit in the more obvious interpretation. In the nature of things

this shifting of emphasis was inevitable from the moment that mental factors in social functioning began to receive attention. A social psychology was in process of differentiation long before it was recognized as a distinct division of labor. The men whose present treatment of social psychology bears least resemblance to Ward's will scarcely fail to recognize him as the first important American adventurer into this type of inquiry. The first American book which bore upon its title page the phrase "social psychology" was written by a psychologist (J. Mark Baldwin, 'Social and Ethical Interpretations,' 1897). Not a few books which at the time of publication were appraised, both by author and public, chiefly with reference to some other element in their contents, now appear to have done their best service in stimulating consciousness that there can be no solution of social problems without resolving the mysteries of transmission of mental influence. When Simon N. Patten published his 'Theory of Social Forces' in 1896, he classed himself as an economist. He was in fact discovering himself and disclosing himself as a daring pioneer in social psychology. Giddings' 'Principles of Sociology' (1896) was accepted chiefly as a proposal in social architecture. The extraordinary attention which it has received all over the world is due fundamentally to the fact that it presented psychological aspects of the problem of society with unusually challenging force. (For digest of Giddings' doctrines, and references to his other works, consult Northcott, 'The Sociological Theories of Franklin H. Giddings,' *American Journal of Sociology*, Vol. XXIV, p. 1, 1918). Thomas' brief monograph, 'The Scope and Method of Folk Psychology' (*American Journal of Sociology*, Vol. I, p. 434, 1896), may be regarded as a prospectus of a division of labor, previously organized in Europe, which has had a large share in reshaping the primal conceptions and the methods of sociology. Notable in this connection are Sumner, 'Folkways' (1907); Thomas, 'Race Psychology: Standpoint and Questionnaire, with Peculiar Reference to the Immigrant and the Negro' (*American Journal of Sociology*, Vol. XVII, p. 725, 1912); and Thomas, 'Source Book for Social Origins' (1909).

Meanwhile a tool had been tacitly adopted into our sociological technique which more than any single instrument has tended to stabilize our procedure. It was the use of the concept denoted by the term "interest," or some equivalent, as the leading clue to the activities of *socii* composing groups, or of groups considered as correlations of *socii*. The term "valuation" has certain advantages over the term "interest" as an expression of the idea. The essential thing is that the motivation of activities in human groups is traced to preferences in the minds of people, and that qualitative and quantitative analysis of these "interests," "valuations," "preferences," with determination of their proportions in the particular combination in question, has become the crucial operation in social interpretation. This method has been implicit at least as a partial recourse in all attempts to explain human nature. It had become more or less systematic in the program of many sociologists before it was

published in the form of an elaborated method. The author who most appropriately marks this stage in the development of sociology is Gustav Ratzenhofer, at the time of the completion of his work an officer on the retired list of the Austrian army, with the rank of Feld-Marschall-Lieutenant. Ratzenhofer's life from early years was that of a soldier. As he rose in rank his outlook became more and more political. He was obliged to study the conditions, first and foremost within the empire, then in countries in political relations with the empire, which served as reasons for the existence of Austrian armies. As this experience matured, it crystallized into an ethic, a sociology, and a political philosophy with a strong set toward political science. Ratzenhofer's chief contribution to sociology is to be found not in his later books, in which he formulated his more general theory of ethics and sociology, but in the work which is most nearly related to political science, 'Wesen und Zweck der Politik. Als Theil der Sociologie und Grundlage der Staatswissenschaften,' (3 vols., 1893). The author's most important additions to the method exemplified in this work were in the single volume entitled, 'Die Sociologische Erkenntnis. Positive Philosophie des socialen Lebens' (1898). Ratzenhofer's method, so far as contained in these two works, may be described as a psychological survey chiefly generalized from, or illustrated by groups visible in and around the Austrian Empire. The outstanding peculiarity of the two works, considered as a single essay in sociological methodology, is the relatively large proportion of concrete material cited in support of the more generalized conclusions. That Ratzenhofer has had so little influence on the Continent can be explained only by the traditional attitude of European scholars toward men not of their gild. The most complete account of his method available in English is a digest, with annotations, in Small, 'General Sociology,' pp. 183-396. The tables, 'Typical Interests Within States,' on page 252, and 'Contemporary Conflicting Interests in Austria,' page 393, present at a glance the scheme of the inquiry.

It is not improbable that greater changes may occur in the next decade in the character of sociology than in any previous decade. At the present moment it manifests six leading tendencies. The first of these appears as "Methodology"; criticism of points of view, working presumptions, attitudes toward other divisions of labor and details of operative programs. Of this tendency the present paper may serve less as an example than as an index. Second, the various forms of "group psychology." Of these we may distinguish (a) the line of development from McDougall, 'An Introduction to Social Psychology' (1909), to Ellwood's volume with the same title (1917); (b) the variety represented by Cooley, 'Human Nature and the Social Order' (1902), and 'Social Organization' (1909). Most prolific at the present moment is (c) that variety which generalizes types of group reaction in selected situations from large numbers of historical and contemporary instances. Examples are Ross, 'Social Control' (1901), the same author's series of papers in *American Journal of Sociology*, beginning Vol. XXI, p. 433, published in book form under the title 'The Principles of

Sociology' (1919); and Cooley, 'Social Process' (1918). Third, a tendency for which no name has been generally adopted, but for convenience we may call it *social analysis*. It is an elaboration of social psychology through selection of particular social groups or social situations, and study of cause and effect as there presented. "As a distinctive method it involves the detection, description and causal explanation of all the factors entering into the social situation, or determining the behavior of the group studied. Social analysis is purely scientific in its interest, and is not immediately concerned with social action. Social laws discovered by social analysis are, however, of value for the determination of fundamental policies of social construction." (Burgess). The most conspicuous example of this method is Thomas and Znaniecki, 'The Polish Peasant.' (Helen Culver Found.) Two of the five volumes announced have appeared (1918). The "methodological note" of 86 pages and the introduction to volumes I and II mark the line of farthest advance at present in plans for this kind of research.

Fourth, *Social Survey*. It has been said that social analysis is to social survey as research in physics to a civil engineer's orientation. "The survey arose from the effort to substitute fact for belief as a basis of social action. As a distinctive method the survey involves study, by application of standards determined by experts, of the problems, institutions and social agencies of a community, as a basis for formulation of a constructive policy or program." (Burgess). "It is the application of scientific method to the study and solution of social problems which have specific geographical limits and bearings, plus such a spreading of its facts and recommendations as will make them, as far as possible, the common knowledge of the community and a force for intelligent co-ordinated action." (Harrison, 'Community Action through Surveys,' p. 11, Russell Sage Found.). Social survey is so much more immediately available for practical purposes than either of the foregoing tendencies, that its bibliography deserves special prominence. On the methodological side, in order of publication, Gillin, 'Application of the Social Survey to Small Communities' (*American Sociological Society Proceedings*, 1911); Riley, 'Sociology and Social Surveys' (*American Journal of Sociology*, Vol. XVII, May 1911); Kellogg, Harrison and others, 'Social Surveys' (Russell Sage Found. 1912); Elmer, 'Social Surveys of Urban Communities' (1914); Park, 'The City, Suggestions for the Investigation of Human Behavior in the City Environment' (*American Journal of Sociology*, Vol. XX, March 1915); Gillin, 'Social Survey and its Further Development' (*American Statistical Association Publications*, September 1915); Burgess, 'The Social Survey: A Field for Constructive Service' (*American Journal of Sociology*, Vol. XXI, January 1916); Aronovici, 'The Social Survey' (1916); Harrison, 'Community Action through Social Surveys' (Russell Sage Foundation 1916). On the operative side: Booth, 'Life and Labour of the People in London' (9 vols., 1892-97); Rowntree, 'Poverty: a Study of Town Life' (1902); Kellogg (Director), 'The Pittsburgh Survey' (6 vols., The Russell Sage

Foundation 1904-14); Burns (Director), 'Cleveland Education Survey' (25 vols., Cleveland Foundation 1915); Harrison (Director), 'The Springfield Survey' (3 vols., Russell Sage Foundation 1918).

Fifth among contemporary variations of sociology is also without a conventional name. It is most frequently referred to as the *case method*, or *social diagnosis*. "It is the differential method of case work, as it has developed in family and individual rehabilitation, as carried on by charitable organizations. As a distinctive method, case-study involves determination of all the factors present in a given case, so far as is necessary in order to prescribe remedial treatment." (Burgess). Consult Richmond, 'Social Diagnosis,' Russell Sage Foundation, 1917.

Sixth, *concrete programs* for amelioration and construction. Charles R. Henderson included all these in the term *social technology*. In his mind they were "social polity" passing into application. They are sometimes indicated by the more popular phrase *social engineering* (Earp, 'The Social Engineer,' 1911). Discussion of the movements thus suggested would require a treatise. They have a range from kindergarten to international reconstruction. Like all other technical problems after their kind, they draw at need from the whole extant body of knowledge and apparatus of execution. In so far as colleges and universities have provided instruction about these problems, it has most frequently been scheduled either in the department of economics or of sociology. This assignment obviously corresponds more to academic convenience than to intrinsic relationship.

What then is the technique which is now the distinctive equipment of the sociologist? Primarily it is a *collection of categories*. First of all, these are categories of rationalization. They are sub-species in the gradations within the genus of thought forms which reflect human relations in the large. They begin with the most general, such as "group," "socius," "group structure," "group function," "group forces," "group process," "group interest," etc. These most general categories pass into subordinate forms which reflect descending orders of generality in observed group phenomena. The scale passes from least specific terms to most specific through categories for rough preliminary classification of groups. The variations of these are innumerable, because there is no limit to the number of principles which may be made the basis of classification. Thus, for certain purposes, objectivity is served by analysis of groups strictly on the basis of quantitative classification (Simmel, 'Soziologie,' Chap. II, "Die quantitative Bestimmtheit der Gruppe." Id. "The Number of Members as Determining the Sociological Form of the Group," *American Journal of Sociology*, Vol. VIII, pp. 1 and 158). For references to all of Simmel's papers on this subject which have been published in English, vid. *American Journal of Sociology*, Vol. XX, p. 629, note. For other purposes, objectivity is served by applying one or more of the gradations of categories on the basis of race, industry, religion, culture, politics, language, etc. It is obvious that these less general categories need not necessarily in the first instance be original

with the sociologists. The contrary is probable. They are more likely to be categories worked out by anthropologist, ethnologist, economist, etc., and taken over by the sociologist whenever his problem involves the previous work of other divisions of science. For example, few men within the ranks of the sociologists have exerted more influence upon sociological method than the anthropologist, Lewis Henry Morgan ('The League of the Iroquois,' 'Ancient Society,' etc.), or the English professor of jurisprudence, Sir Henry Maine ('Ancient Law,' 1861; 'Village Communities,' 1871; 'Early History of Institutions,' 1875; 'Dissertations on Early Law and Custom,' 1885, etc.). These categories do not of themselves constitute sociology, any more than the categories "multiplicand," "quotient," "cube root," constitute mathematics. The uses of the categories constitute sociology. The technique accordingly involves, second, a body of procedure. This varies, in accordance with the particular character of the problem undertaken, from the most abstract dealing with questions of epistemology and methodology to the most concrete questions of juvenile courts or milk supply. The generic factor in common, from one end of this scale to the other, is reference of the problem to its group attachments, instead of treating it as something isolated from the human process as a whole. The technique involves, third, control of an enormous accumulation of knowledge about social reactions. A generation ago it was urged with much pertinence that colleges and universities should not give academic standing to the new claimant "sociology," until it could justify recognition by presenting an organized body of knowledge. Meanwhile the sociologists have accumulated an appalling volume of insights into social relationships which had not been noticed by previous scholars. And the search with the new equipment is hardly begun. It remains true that organization of this knowledge is far from adequate. (Vid. Hayes, 'Sociology as Ethics,' *American Journal of Sociology*, Vol. XXIV, p. 289). The most successful attempts to gather sociological results into textbook form are, on the side of social organization and operation, Blackmar and Gillin, 'Outlines of Sociology' (1915); on the side of ethical evaluation of social processes, Hayes, 'Introduction to the Study of Sociology' (1915); on the side of social psychology, Bogardus, 'Essentials of Social Psychology' (1918).

In view of the relation which we have indicated between political science and sociology, it is equally astonishing and unfortunate that for nearly a generation legal institutions were left almost wholly outside the range of American sociologists' vision. No one without legal training could venture successfully into the field thus neglected, and for a long time sociological methods found no favor with American legal scholars. The situation has notably changed since Roscoe Pound, now Dean of Harvard Law School, became the leading attorney in this country for an attitude toward legal construction precisely opposite to that of Savigny in his controversy with Thibaut in 1814. This factor has already had such influence with law faculties, and among social scientists in general, that quite possibly the most important sociolog-

ical advances in the next generation will proceed from the basis of legal study. Consult Pound, 'The Scope and Purpose of Sociological Jurisprudence,' 23 *Harvard Law Review*, 591, 25 *Harvard Law Review*, 140-489; 'The End of Law as Developed in Legal Rules and Doctrines,' 27 *Harvard Law Review*, 195; 'The End of Law as Developed in Juristic Thought,' 27 *Harvard Law Review*, 605, 30 *Harvard Law Review*, 201. Somewhat less technical than the papers of Dean Pound are the three volumes in the *Evolution of Law Series*, compiled by Professors Kocourek and Wigmore of the Northwestern University Law School, 1918. The separate titles are (1) *Sources of Ancient and Primitive Law*. (2) *Primitive and Ancient Legal Institutions*. (3) *Formative Influences of Legal Institutions*.

To recapitulate: Although the earlier social scientists never confessed it in quite this way, it is easy to see now that all of them, including the sociologists, who indulged at all in speculations about the larger aims of science treated the aggregate of human events, past and present, like a collection of structural elements; and they assumed that the task of social science, their own part of it in particular, was to organize all the miscellaneous events which have filled the career of mankind from the beginning up to the present into a schematic combination, in which each occurrence would have its appropriate place, and in which the relation of each occurrence to every other occurrence would be evident.

We may frankly admit that sociology would not have been born when it was, and its early history would not have been what it was, if this conception of scientific possibility had not stimulated a few men to risk the attempt to realize this conception, which men before them in other branches of science had dismally failed to vindicate. At the same time, we must insist upon the truth that, in this respect, the sociologists were merely experimenting with a chimera which had over and over again lured social scientists of all the older types.

But just as the more objective historians of the latest half century have fortified themselves against suspicions of identity with the so-called philosophers of history, so the sociologists of to-day are more or less consciously and explicitly repudiating the conception just indicated, which they or their immediate predecessors unblushingly published a generation ago. The totality of human experience is too big, too complicated, too unexplorable, to be exhibited by the human mind as a complete and inclusive system of articulated parts, with each event throughout the length and breadth of human experience visibly bearing its actual relation to all the other events. The thought of such comprehension as something within the reach of human intelligence can no longer be entertained by a responsible mind. Our ideal at present is discovery of typical, qualitative relationships of antecedent and consequent, of cause and effect, of harmony and disharmony, of stability and instability, of constructiveness and destructiveness, in as many different types of human groups as possible. We entertain hopes of reaching certain quantitative expressions of the same relations, but about these we are much less sanguine. This is on the purely scientific side, antecedent to whatever we may feel au-

thorized to undertake on the side of social control or social art.

We understand that there are enormous differences in the feasibility of this ideal, dependent for instance upon the remoteness or nearness in space or time, or upon the simplicity or complexity of the group immediately in question. We believe that from generation to generation men may, and with progressive use of available means for accumulating knowledge of human conditions they will become more sophisticated and competent to control their situation in the interest of increasing development of human capacities. Within recent years the advances of social science in general, and of sociology in particular, have manifested increasing deference to the conception set forth in this review. Indeed, no account of sociology would be authentic unless it were an exposition of it as a multitude of mental processes converging toward and operating in accordance with substantially this description.

ALBION W. SMALL,

Head of the Department of Sociology, University of Chicago.

SOCK, originally a low shoe or slipper, worn by the Greeks and also by the Roman women, who had them highly ornamented. They were likewise worn by comic actors, the buskin, or cothurnus, being used in tragedy; hence sock and buskin are used figuratively as equivalent to comedy and tragedy. Now a short stocking.

SOCORRO, sô-kôr' rô, Colombia, a town in the province of Santander, 150 miles northeast of Bogotá. Its buildings are insignificant; the climate is hot and insalubrious. The manufactures are cotton goods and straw-plaiting. There is considerable trade in sugar, cotton and indigo. Agriculture is the chief occupation of the region. Pop. 12,000.

SOCOTRA, or **SOKOTRA**, sô-kô'trâ, an island in the Indian Ocean, belonging to Great Britain, 150 miles northeast of Cape Guardafui. Its area covers 1,382 square miles. It consists of mountains, covered by forests, rising to heights sometimes of 4,500 feet; plateaus almost destitute of vegetation, fertile valleys and coast lands. The climate is warm and very dry. The finest aloes of the world are grown here; also dates. Livestock raising is an important industry. The people are a mixed race (negro, Arab and Indian), but present two distinct types. In 1876 the English government entered into a treaty with the ruling sultan, declaring a suzerainty and in 1886 annexed the island. English and German expeditions have investigated its natural features and geology, which is of great interest, being considered a fragmental area of an early continent, perhaps a part of Africa; with later intrusions due to volcanic action. Of 47 species of shell found, 44 were indigenous to the island. Tamarida is the principal town. Pop. (est.) 10,000.

SOCRATES, sôk' rā-tēz, Greek philosopher: b. Athens, in 469 B.C.; d. 399 B.C. His father, Sophroniscus, was a sculptor, and Socrates himself followed this occupation for a time. His mother, Phænarete, was a midwife. In his youth he received the education prescribed by the laws, and also made himself acquainted with geometry and astronomy. That he had listened to Anaxagoras or Archelaus is only reported by untrustworthy authorities; Plato accounts for his master's acquaintance with the works of the former by supposing that he had read the work written by that philosopher. According to Xenophon he was familiar with the doctrines of other natural philosophers, although he did not accept them. Plato represents Socrates as saying that, while still very young, he met Parmenides, the most important of the Eleatic philosophers, who was then advanced in years, as the latter was expounding his doctrines. A material influence on his philosophical development was exercised by the Sophists, to whose discourses he occasionally listened, and with whom he frequently entered into conversation. Excepting in connection with his philosophical career, only a few circumstances of his life are known. He

served as a hoplite or heavily armed soldier in the campaign of Potidæa (432-429 B.C.), where he excelled his fellow soldiers in the ease with which he endured the hardships of a winter campaign, distinguished himself by his valor, saved the life of his friend Alcibiades and resigned to that youth the prize of honor which was awarded to his own bravery. He fought at the battle of Delium (424), and according to one account saved the life of Xenophon, while according to another his own retreat was protected by Alcibiades. In 422 he marched with Cleon against Amphipolis. On two memorable occasions he came boldly to the front in political life. After the battle of Arginusæ (406) 10 naval officers were publicly arraigned for neglecting the sacred duty of burying the slain in consequence of a violent storm. The clamor for their condemnation rose so high that the court wished to proceed in violation of all legal forms; but Socrates, the presiding judge on that day, refused to put the question. He soon after showed that he could withstand tyrants as well as the populace. He was summoned by the Thirty to proceed with four other persons to Salamis to bring back Leon, an Athenian citizen who had retired thither to escape the cruelty and rapacity of the new government. He alone refused, while the others obeyed the order. He declined taking further share in public affairs, giving as a reason the warnings of an internal voice, a divine Mentor, of which he was wont to speak.

In the writings of the disciples of Socrates, he appears almost always as a man advanced in years, such as they themselves had known him. With remarkable physical strength and endurance, he trained himself to coarse fare, scanty clothing, bare feet, and indifference to heat or cold, aiming thus to reduce the number of his wants, as a distant approach to the perfection of the gods, who want nothing. He had a flat nose, thick lips, prominent eyes, bald head, squat figure and ungainly gait, so that Alcibiades likened him to an uncouthly sculptured Silenus containing within the images of the gods. He brought into thorough subjection his naturally impetuous appetites and irascible temper and has been called the most illustrious example in history of the moral conscience, and the creator of moral science. But though a sage he was wholly removed from the gloom and constraint of asceticism; he indeed exemplified the finest Athenian social culture, was a witty as well as a serious disputant, and on festive occasions would drink more wine than any other guest without being overcome. Of his wife Xanthippe, all that has passed into history is that she bore him three sons, that she was an arrant shrew, and that he married and endured her for self-discipline. Among the most distinguished of his companions were Plato, Xenophon, Crito, Euclid of Megara, Antisthenes, Aristippus, Phædon, Æschines, Cebes and Alcibiades. He devoted his life especially to the education of youth and for the accomplishment of this end he relied on *erôs*, love, which, without excluding its sensuous element, he refined and utilized as an instrument in the conduct of souls and the common development of his thoughts and those of his listeners. Socrates was firmly convinced that he was charged with a special religious mission. He believed he was called by the Deity to strive, by means

SOCRATES

of his teaching and life, after a revival of moral feeling, and the laying of a scientific foundation for it. For this reason he had been warned against participating in public affairs by the internal divine voice already mentioned. Relying, too, like his countrymen, on divine intimations by dreams and oracles, he believed that his mission had been signified to him by these. Aristophanes, in his comedy of 'The Clouds' (first represented in 423), attributes to Socrates not only traits of character and opinions which really belonged to him, but also Anaxagorean doctrines and sophistical tendencies.

In 399 B.C., formal accusation was brought against the philosopher in the following terms: "Socrates is guilty of crime, first, for not worshipping the gods the city worships, and for introducing new divinities of his own; next, for corrupting the youth. The penalty due is death." These are virtually the same charges as laid against him by Aristophanes more than 20 years earlier. His accusers were Meletus, a young dramatic poet, little known, and personally almost a stranger to Socrates and who is said to have joined in the accusation because he felt himself injured by Socrates' demonstration of the ignorance of poets respecting their art; Anytus, a rich leather-dealer and influential demagogue, who was displeased with the depreciatory judgment of Socrates respecting the Athenian statesmen and politicians; and Lycon, a public orator, who felt injured by what Socrates said of the orators. The trial took place before a dikastery, or law-court composed of citizen judges, like our juries, but far more numerous; the number present on this occasion has been variously set down at 500, 501, 557, and 567. His bold defense, which appeared to his judges as presumptuousness, is preserved by Plato, under the title of the 'Apology of Socrates.' He dwelt on his mission to convict men of their ignorance for their ultimate benefit; declared himself a public blessing to the Athenians; assuring them if his life was spared he would continue in the same course; and regarded the approach of death with utter indifference. To his judges his philosophical reflections seemed a violation of those ethical and religious foundations of the Athenian state, which the restored democracy was endeavoring to re-establish. The former intimacy of Socrates with Alcibiades and with the hated tyrant Critias, led to a mistrust of his doctrines and purposes. Yet the condemnation was voted by only a small majority, some read three and others 30. But since after his condemnation he would not acknowledge himself guilty, by expressing an opinion as to the punishment he should receive, but declared himself worthy, on the contrary, of being fed at the Prytaneum as a benefactor of the state, and at last only on the persuasion of his friends agreed to a fine of 30 minæ, he was condemned to death by an increase of 80 votes. The execution had to be delayed 30 days, until the return of the sacred ship which had been sent to Delos on the periodical Theoric mission. Every morning his wife and three sons, together with his companions and friends, assembled in his cell, and he conversed with them as he had been wont to do. In his solitary hours he composed a hymn to Apollo and versified several of the fables of Æsop, his first attempts at poetical

composition. His friends formed projects for his escape and Crito, his old and tried friend, undertook to persuade him to comply with their wishes. He considered it, however, his duty as a citizen to obey the laws, though they were badly administered and would not consent. Early on the morning of the fatal day his wife and friends met in his cell to spend the last hours with him. Xanthippe was much affected, and showed her grief by loud cries; Socrates made a sign to Crito to have her removed, as he wished to spend his last moments in tranquillity. He then talked with his friends, first about his poem, then concerning suicide, and at last on the immortality of the soul. The manner in which the assembled friends, in the alternation of joyful admiration and profound grief, lauded him as one who, by the divine appointment, was going to a place where it must fare well with him, if with any one; how he departed from them with the one wish, that in their care for their true welfare they would cherish in their memories all his sayings; and how he designated the transition to the life beyond death as the true recovery from a state of impurity and disease, is set down in lively and affecting colors by his great disciple Plato, in the dialogue 'Phædo.' The approach of twilight at length admonished them that the hour had come. He took the hemlock cup, calmly and slowly drank the poison. He then walked up and down the apartment, trying to console his weeping friends. When it became difficult to walk he lay down upon his couch, and before his heart ceased to beat he exclaimed: "My friends, we owe a cock to Æsculapius." He then covered himself up with his cloak and calmly expired. "Thus died the man," says Plato in his 'Phædo,' "who of all with whom we are acquainted was in death the noblest, in life the wisest and most just."

In their accounts of the life of Socrates the two principal authorities, Xenophon and Plato, substantially agree, although the Platonic picture is sketched with the more delicate pencil. As to their reports of his doctrine, it is first of all undoubtedly true that Plato in his 'Dialogues' generally presents his own thoughts through the mouth of Socrates. But in a certain sense his 'Dialogues' can nevertheless serve as authorities for the Socratic teaching, as the groundwork of the Platonic philosophy is contained in the Socratic, and as it is possible, in general, though not in all cases in detail, to discriminate between the Platonic and Socratic elements. Plato was cautious enough not to be led by his love of idealization too far from historic truth; in some of his compositions he remains almost entirely faithful to it, and in others puts those doctrines which Socrates could not have professed into the mouth of other philosophers. Xenophon wrote the 'Memorabilia' and the 'Symposium' not so much in the spirit of a pure historian as in that of an apologist; but his honorable defense of Socrates demands from us entire confidence in his historic fidelity, so far as his intention is concerned. But it must be acknowledged that as much cannot be said of his intellectual qualification for an exact and comprehensive understanding of the Socratic philosophy. Xenophon appears to attribute too unconditionally to Socrates the tendency natural to himself to

connect all scientific activity with a practical purpose, and he thus gives too small a place to the dialectic of Socrates as compared with his ethical teachings. The brief statements of Aristotle respecting the philosophical doctrines of Socrates are very valuable, since they are purely historical, and relate to the most important points of his teaching. The previous philosophies consisted of vague speculations on nature as a whole, combining cosmology, astronomy, geography, physics, metaphysics, etc. Socrates had given much attention to these subjects and arrived at the conclusion that the knowledge he had gained was of little practical value. Astronomy might have a certain value in navigation and in the measurement of time, and so should be learned to some extent by the pilot and the watchman; geometry was useful when confined to land-measuring; arithmetic might be useful in many of the affairs of daily life, and so on; but the speculations of philosophers, from Thales downward, as to the origin of all things out of fire, water, air, etc., he regarded as profitless, nay, as impious even. "Do these inquirers," he would ask, "think that they already know human affairs well enough that they thus begin to meddle with divine? Do they think they shall be able to raise or calm the winds at pleasure, or do they simply seek to gratify vain curiosity?" The gods managed the operations of nature after their own pleasure, and refused to submit them to invariable laws of sequence, such as could be discovered by human study; the only means of knowledge permitted was sacrifice, prayer and the consultation of the oracles. Men's strivings after knowledge should be directed to the human relationships as involving men's practical concerns. Self-knowledge, the fulfilment of the requirement of the Delphic Apollo, "Know thyself," is the condition of practical excellence. External goods do not advance their possessor; to want nothing is divine, to want the least possible brings one nearest to divine perfection. Virtue is capable of being taught, and all virtue is in truth only one; no man is voluntarily wicked, all wickedness simply resulting from ignorance. The good is identical with the beautiful and the useful. Cicero's well-known saying that Socrates called philosophy down from the heavens to earth and introduced it into the cities and houses of men, compelling men to inquire concerning life and morals and things good and evil, indicates in terms substantially correct the progress of philosophy in Socrates from the cosmology and physics of his predecessors to anthropological ethics. He possessed, however, no complete system of ethical doctrines, but only the living instinct of inquiry, and could, therefore, naturally arrive at definite ethical theorems only in conversation with others. The fundamental thought in his political doctrine is that authority properly belongs to the intelligent — to him who possesses knowledge. The good ruler must be, as it were, a shepherd to those whom he rules; his business, his "virtue," is to make them happy. Socrates did not favor the appointment of officers by popular suffrage and by lot. He defends the belief in the existence of gods on teleological grounds, arguing from the structure of organized beings, and founding his reason on the general principle that whatever exists for a

use must be the work of intelligence. The wisdom which is present and rules in all that exists determines all things according to its good pleasure. It is distinguished from the other gods as the ruler and disposer of the universe. The gods, like the human soul, are invisible, but make known their existence unmistakably by their operations.

It is reported that soon after the death of the great philosopher the Athenians regretted their sentence and that to expiate their crime a brazen statue, the work of Lysippus, was dedicated to his memory. Yet a more general revulsion of opinion in favor of Socrates seems first to have taken place in consequence of the labors of his scholars. That some of the accusers were put to death and others exiled is probably a fable, founded perhaps on the fact that Anytus, banished in all likelihood for political reasons, died in Heraclea, on the Pontus, where in later centuries his tomb was still pointed out. Consult Burnet, J., "Thales to Plato" in 'Greek Philosophy,' Part I (London 1914); Forbes, J. T., 'Socrates' (New York 1905); Gomperz, T., 'Greek Thinkers' (New York 1905); Hyslop, J. H., 'Ethics of the Greek Philosophers' (New York 1904); More, "Socrates" in 'Shelburne Essays,' 6th series (New York 1909); Wright, W. C., 'A Short History of Greek Literature' (New York 1907); Zeller, E. G., 'Socrates and the Socratic Schools' (tr. by Richel, O. J., 3d ed., London 1885).

SOCRATES, Scholasticus, Greek Church historian: b. Constantinople, about 380; d. after 440. Little is known of his life except that he lived in Constantinople and was an advocate. His history, written about 439, embraces the period 306-439, and is written in seven books still in existence. Together with the histories written by Sozoman and Theodoret it forms one of the three histories of the period extant, and was written before the other two, whose writers were evidently familiar with it. While not a history in the accepted sense of the word it is nevertheless a valuable source of information for the period it covers. It is not the work of a man of deep learning, nor of astute knowledge of either church or state, but it is nevertheless of unquestionable honesty and straightforward in character. It was edited by Stephanus (Paris 1544); Reading (Cambridge 1720); Hussey (Oxford 1853; reissued by Bright, 1878); Oxford school edition, after Reading's version (1844). Consult also Geppert, F., 'Die Quellen des Kirchen Historikers Socrates Scholasticus' (1898).

SODA, Commercial Production. Sodium carbonate in the form of soda ash is the principal form in which commercial soda is produced although some of it is immediately transformed into caustic soda. The main source is salt and limestone treated by the Solvay process, but a small amount is made from natural sodium carbonate chiefly from water of Owens Lake in southeastern California. Some is also saved from waste water of pulp and paper mills and a few mills make sodium carbonate by an electrolytic process employing carbon dioxide generated in lime kilns.

Production of soda ash in 1918 was 1,390,628 short tons, valued at \$35,635,520, or about

the same tonnage as in 1917, valued at \$38,028,000. This does not include the soda ash converted by the producers into caustic soda or sodium compounds to an amount estimated at 664,000 short tons in 1918 and 482,000 short tons in 1917. The total value of all sodium compounds produced in the United States in 1917 is estimated at \$74,000,000. In 1917 eight companies made caustic soda from soda ash (358,081 tons), and 28 companies made 137,663 tons by reduction of sodium chloride by electrolysis, in most cases utilizing the chlorine gas liberated. Some of the manufacturers use a part of their product for technical processes of various kinds. Exports of soda ash in 1918 were 119,218 short tons, valued at \$7,805,550, sent mostly to Japan, Canada, Argentina, Brazil, Australia, Cuba and Chile. Considerable soda is imported into the United States, the total value in 1917 being about \$74,000. Soda ash is used for making glass, soap, dyestuff, explosives and as washing materials; sodium compounds have replaced potassium wholly or in part in many technical processes. In 1917 there was sold 174,217 tons of cooking soda or sodium bicarbonate valued at \$5,292,374 and 77,939 tons of washing soda valued at \$1,698,528. Caustic soda is used for making soap, pigments and wood pulp, in purifying oils and fats, in mercerizing cotton, as a general cleanser (lye) and in making dyes and phenol, the latter used for making such explosives as ammonium picrate and lyddite.

N. H. DARTON.

SODA NITRE, native sodium nitrate, NaNO_3 . It is a colorless, deliquescent mineral, crystallizing in the rhombohedral system, but usually massive in beds. It occurs near Lovelock's, Nev., and near Calico, Cal., and in vast beds in Chile, where it is extensively mined. It is one of the most important fertilizers (q.v.), and is also used in the manufacture of nitre.

SODA WATER, a beverage consisting of water charged with carbon-dioxide gas under pressure, so that it appears aerated. It received its name from the fact that in its early manufacture it was generated from sodium bicarbonate with an acid. It is usually flavored with a sweet syrup of fruit or some chemical substitute, and a great variety of "soft" drinks are compounded and sold at soda fountains, which are common adjuncts of drug stores in the United States.

SODALITE, a widely-distributed rock-forming mineral. It is a common constituent of volcanic rocks, especially *elæolite*-syenites, in which it occurs in isometric crystals or in grains or massive veins. A sodalite-trachyte abounds in the island of Ischia, near Naples, while fine, white crystals occur in the bombs of Vesuvius. It is best known, however, as a cleavable-massive mineral of rich azure-blue color. It is found thus at Litchfield, Maine, in Ontario and British Columbia, and is well adapted for use as an ornamental stone. Its hardness is 5.5 to 6; specific gravity 2.14 to 2.34; lustre vitreous or greasy; composition, aluminum and sodium orthosilicate with sodium chloride.

SODALITE GROUP includes sodalite, haunynite, noselite and lazurite, all minerals crystallizing in the isometric system and of

unusual interest chemically because they are isomorphous compounds of an orthosilicate with the salt of another acid or with a haloid. Their relations to the garnet group have been developed by Brögger.

SODDY, Frederick, English chemist: b. Eastbourne, 2 Sept. 1877. He was educated at Eastbourne College, the University College of Wales, at Merton College, Oxford, and studied under Sir Ernest Rutherford at Montreal and under Sir William Ramsay at London. In 1900-02 he was demonstrator in chemistry at McGill University; lecturer in physical chemistry and radioactivity at Glasgow University in 1904-14; and has since been professor of chemistry at the University of Aberdeen. He has specialized in the field of radioactivity. He was elected a Fellow of the Royal Society in 1910; and in 1913 he received the Cannizzaro Prize of the Accademia dei Lincei, Rome. Author of 'Radioactivity, an Elementary Treatise from the Standpoint of the Disintegration Theory' (1904); 'The Interpretation of Radium' (1909); 'Matter and Energy' (1912); 'Chemistry of Radio-elements' (1912-14).

SODEN, Hans Karl Hermann, BARON VON, German Protestant theologian: b. Cincinnati, Ohio, 16 Aug. 1852; d. 1914. He was educated at Esslingen, Urach and at the Theological Institute at Tübingen. He was archdeacon at Chemnitz in 1883-86, and was thereafter pastor at Jerusalemkirche, Berlin. From 1893 he was also associate professor of New Testament exegesis at the University of Berlin. He made a lifework of the collection and comparison of New Testament manuscripts. He wrote 'Der Brief des Apostels Paulus an die Philipper-briefe' (1890); 'Reisebriefe aus Palästina' (1898); 'Die wichtigsten Fragen im Leben Jesu' (1904; 2d ed., 1909); 'Die Schriften des neuen Testaments' (1904); 'Urchristliche Literaturgeschichte' (1905), etc.

SODIUM (from "soda," which word was used in the Middle Ages to designate alkaline substances in general), a metallic element, first prepared by Davy in 1807, by the electrolysis of molten caustic soda, or sodium hydroxide. In 1808 Gay-Lussac and Thénard showed that the metal can be prepared by reducing the hydroxide with finely divided metallic iron. Brunner, about 1823, obtained metallic sodium by reducing sodium carbonate with carbon; and Deville, in 1855, improved Brunner's process so as to make it commercially practicable for the manufacture of sodium on the large scale. Deville's method, as practised in recent times, consists in distilling a mixture of 30 parts of calcined carbonate of sodium, 13 parts of coal and 7 parts of lime; the reduction taking place at a temperature of about 2,500° F., the metal being given off in the form of a vapor, which is then passed into a condenser and allowed to liquefy and solidify. As thus obtained, sodium contains numerous impurities, most of which may be removed by straining the melted metal through linen under rock oil, at a temperature of about 212° F. Deville's process of manufacture was used almost exclusively until about 1886, when the well-known Castner process came into use. Castner reduced sodium hydroxide by a combination of carbon and iron, prepared by coking a mixture of pitch and finely divided iron; the coked mass

having approximately the composition of Fe_3C , and being commonly known as "carbide of iron," although it is doubtful if this name is chemically justifiable. The Castner process possesses many practical advantages over that of Deville, and hence it rapidly came into almost universal favor. A considerable quantity of metallic sodium is now prepared by the direct electrolysis of molten sodium hydroxide, or sodium chloride (common salt). Sodium possesses powerful reducing properties, and the metal is used in the preparation of silicon, boron, aluminum and other elements whose reduction by means of carbon is either difficult or impossible. Deville, in fact, developed his method of preparation with the object of using the sodium that it yielded in the subsequent preparation of metallic aluminum (q.v.); and for many years the commercial supply of aluminum was practically all prepared by reducing aluminum compounds with metallic sodium. Since the development of the Hall process for the manufacture of aluminum by electrolysis, metallic sodium has lost a considerable part of its former great commercial importance.

Sodium is a silvery-white metal, hard at 0°F ., ductile at 32° , wax-like at ordinary temperature and pasty at 120° . It melts at 207°F ., and boils at about $1,700^\circ$. It oxidizes with great facility, and must be kept under benzene, or petroleum, or some other fluid that is devoid of oxygen, or in a neutral atmosphere of hydrogen, coal gas or some other substance for which it has no affinity. It may be prepared in the form of lustrous, octahedral crystals, white in color but with a rosy sheen. Like potassium, it dissolves in anhydrous liquid ammonia (NH_3), forming a blue solution from which the metal may be again obtained by the evaporation of the solvent. Sodium has a specific gravity of about 0.98, a specific heat (in the solid form) of 0.273, and a coefficient of linear expansion (Fahrenheit scale) of 0.000395. At the freezing point of water, the specific electrical resistance of sodium is about one-eighteenth of that of mercury.

Chemically, sodium is a monad. It has the chemical symbol of Na (from "natron," the Spanish name for native carbonate of sodium), and its atomic weight is 23.00 if $\text{O}=16$, or 22.82 if $\text{H}=1$. It forms a multitude of compounds, many of which are of great importance in the arts. The chloride of the metal occurs in great abundance in nature, as common salt. (See SALT). Its formula is NaCl , and it is extensively used as a source of sodium in the preparation of other compounds of the metal. Sodium nitrate, NaNO_3 , commonly known as "Chile saltpetre," occurs native in large quantities in Chile, and as it is much cheaper than the native nitrate of potassium, it is used largely in the manufacture of ordinary nitre; chloride of potassium and nitrate of sodium reacting together to form chloride of sodium and nitrate of potassium. (See NITRE). Sodium bromide, NaBr , which is extensively used in medicine as a sedative, is prepared by adding bromine to a solution of pure sodium hydrate, NaOH , till the liquid becomes slightly yellow. It is then evaporated to dryness, and strongly heated to decompose the bromate, NaBrO_3 , which is formed simultaneously with the

bromide; after which the residue is redissolved and crystallized by evaporation.

Two oxides of sodium are known. Sodium monoxide, Na_2O , may be prepared in several ways, but it is doubtful if it has yet been obtained in a state of absolute purity. It is formed when metallic sodium is oxidized in dry air or dry oxygen, at ordinary temperatures; but it is said that some small trace of moisture must be present, in order for the oxidation to proceed. This monoxide is a grayish solid, having a powerful affinity for water, with which it combines to form sodium hydroxide (NaOH), as indicated by the equation $\text{Na}_2\text{O} + \text{H}_2\text{O} = 2\text{NaOH}$; the combination being attended by the development of a considerable quantity of heat. The monoxide may also be prepared by heating dry sodium hydroxide with metallic sodium, its formation in this case being attended by the liberation of hydrogen. Sodium peroxide, Na_2O_2 (also called the "dioxide"), is of considerable commercial importance, owing to its increasing use as a bleaching agent. It is prepared by passing a stream of dry air slowly over melted sodium at a temperature of about 570°F ., the sodium being thereby converted into a mixture of the monoxide and peroxide. When all the sodium has been oxidized, the air current is replaced by a stream of dry oxygen gas, which transforms the monoxide that is present into peroxide. Sodium peroxide is soluble in water, but the solution readily decomposes with the formation of sodium hydroxide and the liberation of oxygen, as indicated by the equation

The bleaching effect of the peroxide is due to this liberation of oxygen from the aqueous solution.

Sodium carbonate, Na_2CO_3 , commonly known simply as "soda," or, in the impure form, as "soda ash," is one of the most important chemical substances known. It was formerly prepared mainly from the ashes of sea-plants, in the same way that carbonate of potassium is obtained from the ashes of land plants; but at the present time it is prepared almost exclusively by chemical means, from common salt. For many years the only method in use for its manufacture was that invented by Leblanc, during the first French Revolution, in the latter part of the 18th century. In 1838 the "ammonia" process was patented in England, but although this promised to be superior to the method of Leblanc, certain practical difficulties were encountered which proved to be fatal to its success, until they were overcome by E. Solvay, who erected the first commercially successful "ammonia process" plant near Brussels, in 1861, and for whom the process itself has since been named. A certain proportion of the output of sodium carbonate is also manufactured by electrolysis; but the greater part is manufactured by the Solvay process though the Leblanc method is still used to a considerable extent.

Leblanc Process.—In the Leblanc method for the manufacture of sodium carbonate there are two successive operations to be performed. The first of these, which is known as the "salt cake" process, has for its object the transformation of chloride of sodium into sulphate of sodium. For this purpose the salt (sodium chloride) is heated with sulphuric acid in large

covered iron pans; hydrochloric acid being liberated in the course of the reaction, as indicated by the equation

The hydrochloric acid vapors which are thus generated are passed through a "scrubbing tower," which contains coke or brick, over which a stream of water is kept running, the hydrochloric acid dissolving in the water, and constituting an important by-product. The crude sodium sulphate, Na_2SO_4 , is the "salt-cake" from which this part of the process takes its name. Pure crystallized sodium sulphate (containing 10 molecules of water of crystallization) constitutes the familiar substance known as "Glauber's salt," which is used in medicine as a saline purgative. The salt-cake, as obtained by the first operation, is subsequently treated by the "black ash" process, which is so called on account of the color of the immediate product that it yields. Ten parts of the salt-cake are mixed with 10 of limestone (calcium carbonate) and seven and a half of coke, and the mixture is heated in a reverberatory furnace, technically known as a "balling furnace." The carbon of the coal reduces the crude sodium sulphate to the form of sulphide of sodium, Na_2S , in accordance with the equation

while the sulphide, thus produced, is converted into sodium carbonate and calcium sulphide (CaS), by the limestone (CaCO_3), in accordance with the equation

In practice these two reactions go on together, and the final mixture of calcium sulphide, sodium carbonate and such impurities as may be present is the so-called "black-ash," or crude soda. Calcium sulphide is insoluble in water in the presence of lime, and hence it is easy to separate the sodium carbonate from the mass by solution and subsequent crystallization. "Crystallized soda," or "washing crystals," consists of sodium carbonate crystallized with 10 molecules of water.

The Ammonia (or Solvay) Process.—The ammonia process for the manufacture of sodium carbonate depends upon the fact that when bicarbonate of ammonia, $\text{H}(\text{NH}_4)\text{CO}_3$, is added to a solution of common salt (NaCl), bicarbonate of sodium (HNaCO_3) and sal ammoniac (NH_4Cl) are formed, as indicated by the equation

In practice, this operation is carried out by saturating a solution of common salt with ammonia gas (NH_3), and then passing carbon dioxide gas into the solution, under pressure. Bicarbonate of ammonium is formed in the solution, but is immediately broken up with the formation of bicarbonate of sodium, as indicated by the foregoing equation. We may, therefore, regard the reaction as taking place directly in accordance with the equation

$\text{NH}_3 + \text{CO}_2 + \text{NaCl} + \text{H}_2\text{O} = \text{HNaCO}_3 + \text{NH}_4\text{Cl}$. The sal ammoniac, being quite soluble, remains in solution; while the bicarbonate of sodium, being relatively insoluble, is obtained in the solid form. The bicarbonate, when dried and strongly heated, gives off carbon dioxide gas and is converted into the normal carbonate, as indicated by the equation

the carbon dioxide thus freed being again used in the first stage of the process. The sal ammoniac that is formed during the process is recovered from solution by evaporation, and the ammonia that it contains is liberated by the action of lime or magnesia. The reaction in the case of magnesia is

the ammonia being used over again, just as the carbon dioxide is. The magnesium chloride, MgCl_2 , may be thrown away, or it may be resolved, by the action of heat, into magnesia and hydrochloric acid, as indicated by the equation

the hydrochloric acid so obtained constituting a by-product, just as it does in the Leblanc process.

Sodium carbonate is used in the arts for the greatest variety of purposes. When a stream of carbon dioxide is passed through a saturated solution of the carbonate, sodium bicarbonate (or hydrogen sodium carbonate), HNaCO_3 , is formed; and, as has already been stated, the bicarbonate may be again transformed into the carbonate by the action of heat. Sodium bicarbonate is used in the manufacture of baking powders, in the preparation of effervescing drinks, in medicine and for many other purposes.

Sodium hydrate, sodium hydroxide or "caustic soda," may be prepared by boiling lime (calcium hydroxide) with sodium carbonate, the reaction being

The carbonate of calcium that is formed at the same time is practically insoluble, and by allowing it to subside, and evaporating the supernatant liquid to dryness, sodium hydroxide is obtained in the form of a white fibrous mass. The hydroxide melts at a red heat, deliquesces in the air, and absorbs carbon dioxide gas even from the air, passing then into the carbonate. Sodium hydroxide is formed when metallic sodium is thrown upon water, the water being decomposed with the liberation of free hydrogen, according to the equation

The heat developed by this reaction is not in general sufficient to ignite the liberated hydrogen. (Compare POTASSIUM). Sodium hydroxide is intensely alkaline, and large quantities of it are used in the manufacture of soap, in the mercerizing of cotton and for many other purposes.

Of the remaining compounds of sodium, the borate, silicate, phosphate and hyposulphite may be especially mentioned. Borax, or sodium tetraborate, $\text{Na}_2\text{B}_4\text{O}_7 + 10\text{H}_2\text{O}$, occurs native, the chief supply of the United States now coming from California. (See BORAX; BORON). Sodium silicate, Na_2SiO_3 , commonly known as "water glass," is prepared by melting quartz sand with sodium carbonate. It is soluble in water, and is largely used in the manufacture of artificial stone. Three phosphates of sodium are known, phosphoric acid (q.v.) being tribasic. The one which is understood when "sodium phosphate" is mentioned without qualification is the hydrogen di-sodium phosphate, whose formula is HNa_2PO_4 . Hyposulphite (or thiosulphate) of sodium, commonly known as "hypo," has the formula $\text{Na}_2\text{S}_2\text{O}_3 + 5\text{H}_2\text{O}$, and

is prepared by passing a stream of sulphur dioxide gas through a solution of sodium sulphide and sodium hydroxide, and then crystallizing the solution by evaporation. It is extensively used in photography for "fixing" negatives and silver prints; its action depending upon its power of dissolving such parts of the silver salts as have not been reduced by the action of light, or the developer. "Hypo" is also used by paper makers as an antichlor, for neutralizing the last traces of the chlorine that may be left in the pulp, after it has been bleached with "chloride of lime."

In general, the salts of sodium are closely analogous in all respects to those of potassium, so that for most purposes a salt of either of these metals may be substituted for the corresponding salt of the other one. Salts of sodium that are volatile in the flame of the Bunsen burner communicate to that flame an intense orange-yellow color, and when the light from such a flame is examined through the spectroscope, the color is found to be due to a close pair of lines in the orange-yellow region, which coincide with the "D" lines of the solar spectrum. The light from a flame that is colored by volatile sodium salts is nearly monochromatic, and such flames are, therefore, used in numerous physical experiments, in which the production of light of a single wave-length is desired.

A. D. RISTEEN,
Director of Technical Research, The Travelers Insurance Company, Hartford, Conn.

SODIUM, Production of. See ELECTRO-CHEMICAL INDUSTRIES.

SODOM, Apple of. See APPLE OF SODOM.

SODOM AND GOMORRAH, Palestine, the principal of the five cities, Sodom, Gomorrah, Admah, Zeboim and Zoar, described in the book of Genesis as the "cities of the plain" of Jordan. According to Gen. xix, they were overthrown on account of the wickedness of their inhabitants, with the exception of Zoar, which was spared at the supplication of Lot. Modern writers are not agreed as to the site of these cities. They have commonly been placed on the south of the Dead Sea, near the Salt Hill of Usdum; but it appears that this is not in accordance with the Scripture narrative, nor with the other references to these cities in the Bible. The site is supposed to be north of the Dead Sea, and visible on the east from a height between Bethel and Ai. Sodom and Gomorrah are commonly used in the allegorical or denunciatory language of the Scriptures as typical examples of extremely wicked communities; hence the word sodomy. See also DEAD SEA.

SODOMA, II, *el sô-dô-mä*, Italian painter known also as Giovanni Antonio Bazzi: b. Vercelli, 1477; d. Siena, 1549. He was noted for his religious and historical works. His best-known pictures are the famous frescoes in the Villa Farnesina in Rome. Consult Jansen, 'Life of Sodoma' (1870).

SOFIA, *sô-fë'ä*, or **SOPHIA**, Bulgaria, capital of the principality, 310 miles by rail northwest of Constantinople, occupies a plateau of the Balkans. It consists of two distinct sections—the old town and the new town built since 1880. The modern town is suggestive of the French cities; the main streets radiate

from the national palace, and are bordered by stucco-covered houses, and fine government buildings, chief of which are the court of justice, national bank and libraries, war department, city hall, consulates and a capacious theatre; and, in the old town, the cathedral and mausoleum of Alexander of Battenberg. There are extensive bazaars and fine baths. On the highest point in the town stand the ruins of an ancient church (and mosque)—Saint Sophia. There are a university for both sexes, with 2,300 students, several churches, a synagogue and a monument to Alexander II of Russia, military and other schools, and a public park. The gypsy quarter lies between the Lion Bridge and the railway station. There is a brisk trade in hides, liquor, corn and wheat. Sofia stands on the ancient site of Ulpia Serdica, and was occupied by the Bulgarians in 809; in 1382 it was taken by the Turks; in the crusade of 1443 was sacked by the Poles and Hungarians, and in 1878 was captured by the Russians, the Mohammedans fleeing. It has been frequently plundered and bombarded, but remains prosperous, developing rapidly as capital of the Bulgarian principality. Pop. about 105,000; with district, 482,000.

SOFT GRASS, a grass, described as velvet-grass in the article GRASSES IN THE UNITED STATES (q.v.).

SOFT-SHELLED TURTLES. See TURTLE.

SOFTAS, *sôf'taz*, pupils who study Mohammedan law and theology in schools attached to the mosques. They are boarded free of charge, the expense being paid from the revenue of the mosques, or from donations made for the purpose. If too poor to provide their own clothing or bedding, it is found for them by the charitable, the support of the softas in their studies being a favorite and pious object of Mussulman generosity. The softas are a most conservative class, and almost fatal in their adherence to the ancient rules of their religion. They refuse to adopt Western ideas or fashions, and they exert a strong reactionary influence in Turkish affairs. After sufficient study of the Koran, the Sunna, the Arabic language and other Mohammedan learning, they pass an examination which entitles them to be called Khodjas. The term "softas" is also applied generally to the ulemas, imams, and others connected with the mosques. See MOHAMMEDANISM; SUNNA; SUNNITES.

SOFT-SHELL BAPTISTS. See BAPTISTS.

SOHAR, *sô'här*, Arabia, a seaport on the southeastern coast, on the Gulf of Oman, 165 miles northwest of the capital, Muskat. It is a walled town and its chief buildings are a castle and synagogues. There are iron-foundries and other metal-works, also a considerable weaving industry, and the lands of the vicinity are highly cultivated. As early as the 10th century it was an important centre of trade. In the period extending from the 16th to the 17th century, it was occupied by the Portuguese. Pop. 24,000.

SOHN, *zôn*, Karl Ferdinand, German painter: b. Berlin, 10 Dec. 1805; d. Cologne, 25 Nov. 1867. He studied under Schadow; was

appointed professor in the Academy of Düsseldorf in 1832. Among his most celebrated pictures are 'Rinaldo and Armida' (1827); 'Diana and Actæon' (1833); 'The Judgment of Paris' and 'Romeo and Juliet' (1836); 'Tasso and the Two Leonoras' (1838).

SOHRAB AND RUSTUM, by Matthew Arnold (published 1853), is perhaps the most important classical English poem since Wordsworth. Its theme—the combat of a father with his son in ignorance of their kinship—involves central human relations in love and in war, and gives full scope for pathos, tragic irony, and the classical sense of fate. These are conveyed in 891 blank verse lines of clear and measured narrative, with passages of description and dialogue, full of sonorous names after the manner of Milton, and of elaborate similes and other reminiscences of Homer and the Greek tragic poets; so that the focal and universal theme, which even if unembellished would have appealed to all men, is given every means of evoking in instructed readers the peculiarly classical æsthetic effect of modified remembrance and recognition. Yet the poem does not in the least suggest a cento; its action, which, as an "episode" or rather *epyllion*, takes us at once in *medias res*, carries all off with a masterly epic stride; while perhaps the most celebrated passage—that in which, at the end of the poem, the course of the river Oxus is followed to the sea—is modern in its feeling for the resolution of all human discords in nature's serene disregard of them. Comparison of the narrative structure of 'Sohrab and Rustum' with that of the 'Shah Nameh,' the original of the story, will show Arnold's decisive improvements in compactness, in unity, and in economy of means; comparison with other versions of the same theme, such as the fragmentary Old High German 'Hildebrandslied,' and Mr. W. B. Yeats' play 'On Baile's Strand,' will show the equally decisive superiority of Arnold's poem in universality and human significance.

SAMUEL LEE WOLFF.

SOIL, a term used to designate the superficial portion of the earth's surface composed of broken and disintegrated rock mixed with varying proportions of decayed and decaying animal and vegetable matter (humus). For the entire mantle of unconsolidated material covering the earth's surface and including the soil Merrill proposes the expressive name *regolith*, from *ρηγος*, a blanket, and *λιθος*, a stone. The soil proper is the upper portion of the regolith. In humid regions as a rule it is easy to trace the gradation from soil proper at the surface through *subsoil* to the underlying undecomposed rock. The subsoil is distinguished from the surface soil mainly by a smaller percentage of organic matter and greater compactness, the latter being due to the accumulation of finer particles carried down by percolating water (clay subsoil) or to the formation of *hardpan* resulting from the compacting effect of continued cultivation at a uniform depth or to the cementing action of salts formed in the soil (calcerous and alkali hardpan). Hilgard has shown that on account of the absence of the leaching action of water, the soils of arid regions are often uniform to a great depth, there

being little or no distinction between soil and subsoil, although under irrigation and cultivation calcerous and alkali hardpan frequently makes its appearance.

Origin, Formation, and Classification.—Soils have in the main been derived from the solid rock of the earth's crust through the disintegrating (weathering) and transporting action of various agencies, among which are changes of temperature (heat and frost), moving water or ice (glacial action), chemical action of air and water and the influence of animal and vegetable life (including the action of micro-organisms); and since some of these agencies are continually at work the properties of soils are constantly being more or less modified. Soils are grouped according to the method of their formation into two main classes: (1) *Sedentary soils* formed by the weathering of rock *in situ* (residual deposits) or by the extensive accumulation of organic matter as in case of marsh or peat soils (comulose deposits); and (2) *transported soils* composed of materials transported from other localities than that in which the soil is found by water, ice (glaciers) or wind. Under residual soils Merrill includes such as are composed of "those products of rock degeneration which are to-day found occupying the sites of the rock masses from which they were derived, and immediately overlying such portions as have as yet escaped destruction." Such soils occur most extensively in the United States east of the Mississippi River and south of the southern margin of the ice sheets of the Glacial Epoch and are typically exemplified in the usually highly colored brown, red and yellow ferruginous clay soils of the southern Appalachian region. The cumulose deposits are typically illustrated in the United States in the Dismal Swamp lands or the muck soil of Florida.

The more important examples of transported soils are *alluvial soils*, familiarly typified in the river bottom lands and deltas like those of the Nile and Mississippi; *æolian soils* composed of materials transported by the wind and typified by the sand dunes of seacoast regions and the characteristic loess of China and other countries; and *glacial drift soils* due to glacial action. Such drift soils cover a large portion of the northeastern and north central United States and are composed of the debris of disintegrated rocks of various kinds brought down from the north during the glacial period. Besides these main types of soils there are several others of more or less importance in the United States, including the soils composed of fine *volcanic ash* found in considerable areas in Kansas, Nebraska, Colorado, Montana and other Western States; *adobe*, a stiff clayey soil distributed in circumscribed areas over a large portion of the arid region of the United States; *gumbo soil*, a compact fine silty soil; and a so-called loess supposed to be of alluvial origin. In practice soils are, as a rule, described simply as gravelly, sandy, loamy, clayey, calcareous, humous or peaty, etc., according to the fineness of the soil particles and the proportions of sand, clay, lime and humus. They are also distinguished as light or heavy, but as so used these terms do not refer to the actual weight of the soil, but rather to the ease with which it is cultivated. Thus sandy soils, which are termed "light" in an

agricultural sense, are actually heavier than clay soils, which are considered "heavy" from an agricultural standpoint.

There are almost innumerable gradations of soil types as regards chemical and physical characteristics, so that a satisfactory classification on this basis is very difficult. The Bureau of Soils of the United States Department of Agriculture, therefore, maps and classifies the typical soils of the areas it surveys on the basis of the differences in agricultural value as determined by field observations on "the character of the soil and its relation to crops and vegetation," supplemented, however, by physical and chemical examinations. Considering the soil mainly as a medium into which plants send their roots and from which they draw a part of their food, it is evident that its agricultural value will depend largely upon the character of the original rocks from which the soil was derived, the degree of fineness to which the material has been reduced, the amount and character of the organic admixture, as well as upon the treatment to which the soil has been subjected and the changes it undergoes under cultivation. The fertility of a soil is, therefore, determined not only by the store of plant food which it contains, but depends to a large extent upon the chemical, physical and biological processes by which this plant food is rendered available to plants. The soil is not only a storehouse of plant food, but a workshop or laboratory in which this food is being constantly prepared for the use of plants, and it is the object of cultivation to promote the processes by which this is brought about. Chemical, physical and biological properties and processes are so intimately associated in soil that it is not always possible clearly to distinguish between them. For convenience of discussion, however, it is desirable to consider them separately.

Chemical Composition and Properties of Soils.—Plants derive all of their ash or mineral constituents and a large part of their nitrogen from the soil, and in order that a soil may produce plants it must contain these constituents in proper proportion and in assimilable condition. Nitrogen is one of the largest and most important constituents of plants. The ash constituents are taken up in comparatively small amounts by plants, but they are none the less essential to their growth. The more important mineral elements of plant food include sulphur, phosphorus, potassium, calcium, magnesium and iron. Apparently sodium, silicon and manganese are also needed by plants. Since the rocks from which soils are derived contain more or less of all the mineral elements it is not likely that any soil will be entirely lacking in any of those required. Their proportion and availability for assimilation by the plant may, however, vary so widely as to cause wide differences in productiveness. The constituents of soils may be divided into three classes: (1) Active, that is, soluble in water or the root secretions of plants and hence readily available; (2) latent, that is, not soluble in water or root secretions, and hence not readily available, but becoming so in time through natural agencies, by the application of fertilizers or soil amendments, such as lime, marl, etc., or as a result of tillage; and (3) mechanical. The last is by far the largest class, constituting usually from 90 to 95 per cent of the entire mass of the soil,

and chemical analysis shows it to be as a rule mainly silica or sand. Hilgard gives the average composition of soils of arid, semiarid and humid regions as determined by ordinary methods of chemical analysis (treatment with strong acids) as follows:

AVERAGE CHEMICAL COMPOSITION OF SOIL.

CONSTITUENTS	Humid region	Semiarid (transi- tion) region	Arid region
	Per cent	Per cent	Per cent
Insoluble matter	84.17	75.04	69.16
Soluble silica	4.04	8.46	6.71
Potash	.21	.33	.67
Soda	.14	.32	.35
Lime	.13	.70	1.43
Magnesia	.29	.47	1.27
Iron oxide	3.88	2.08	5.48
Alumina	3.66	4.57	7.21
Manganese oxide	.13		.11
Phosphoric acid	.12	.21	.16
Sulphuric acid	.05	.02	.06
Humus	1.22	3.24	1.13
Nitrogen in soil	(.12)	.22	.13

It will be observed that the proportions of actual fertilizing constituents—nitrogen, phosphoric acid, potash, lime, etc.—are relatively small. When, however, the amounts per acre are taken into consideration they assume greater importance. An acre of sandy soil to a depth of one foot may be assumed to weigh about 4,000,000 pounds, of loam soil 3,500,000 pounds, of clay soil 3,250,000 pounds. An acre-foot of loam soil of the humid region, having the average composition given above, would, therefore, contain 7,350 pounds of potash, 4,550 pounds of lime, 4,200 pounds of phosphoric acid and 4,200 pounds of nitrogen, amounts sufficient to supply the needs of many crops. It should be borne in mind, however, that these are average figures from which there may be wide departures even in soils of the same type, and that productiveness of a soil as determined by chemical composition depends, as already stated, not so much upon the total amounts of the constituents present as upon their availability for the uses of plants. Ordinarily chemical analysis may show the presence of large amounts of all the necessary fertilizing constituents and still the soil may be unproductive if these constituents are not in a form in which they may be readily appropriated by the plant. Chemical analysis is capable of showing the presence, absence or marked deficiency of any necessary constituent or the presence of harmful substances, but it has not yet reached such a stage of perfection that it can show with absolute certainty the amount of available plant food which a soil contains.

The methods most commonly used for determining the availability of plant food in soils involve the treatment of the soil with a weak solvent, such as 1 per cent citric acid, fifth-normal nitric acid, carbonated water or ammonia chloride solution, which it is assumed approximates the power of plants to utilize the soil constituents. Schloesing, among others, has called attention to the importance of studying the availability of plant food in the soil by means of water extracts, but the Bureau of Soils of the United States Department of Agri-

culture applying a method based upon the solubility of the soil constituents in water to a large number of productive and unproductive soils of the United States, reached the conclusion that "practically all cultivable soils contain naturally a nutrient solution which varies within comparatively narrow limits with regard either to composition or concentration and which is usually sufficient for plant growth" and that, therefore, there is no obvious relation between the chemical composition of the soil and solution and the yield of crops. The work of others, however, indicate that the growth of plants in the water extracts of soil closely parallel their growth in the soil from which the extracts are made. The recent development of centrifugal, displacement, or pressure methods of obtaining unaltered or but little changed soil solutions in quantity permits of important investigations on this point not heretofore possible.

The availability of the soil constituents depends largely upon the extent to which disintegration has proceeded and the amount of leaching to which the soil has been subjected. Thus in the soils of arid regions in which disintegration has been going on uninterruptedly for ages with no leaching, the soluble salts are always found in large and often in excessive amounts, as, for example, in the so-called *alkali soils*, which are simply soils containing an excess of soluble salts accumulated at or near the surface, and which when this excess is removed, dispersed or otherwise rendered innocuous, are among the most fertile known.

Chemical analysis shows soils to be very variable in composition, and since the processes by which soils are formed and plant food rendered available are continually going on, frequent examinations are necessary if accurate knowledge of the chemical properties of a soil at any given time or of the amounts of plant food becoming available during the period of growth of a plant is to be had. While, as already intimated, chemical analysis must not be taken as an absolute guide to the fertilizer deficiencies and requirements of soils, certain general deductions have been drawn from soil analyses which may be of practical value if applied with discrimination. For example, German authorities classify soils on the basis of their chemical analysis as follows: Soils containing less than 0.05 per cent of either nitrogen or phosphoric acid are considered as poor, those containing from 0.05 to 0.1 per cent moderately rich, 0.1 per cent average or normal, from 0.10 to 0.15 per cent good, and above 0.15 per cent rich; soils containing less than 0.05 per cent of potash are classified as poor, from 0.05 to 0.15 per cent moderately rich, from 0.15 to 0.25 per cent average or normal, and over 0.25 per cent rich; loam soils containing less than 0.1 per cent of lime are classified as poor, from 0.1 to 0.25 per cent moderately rich, from 0.25 to 0.5 per cent average or normal, from 0.5 to 1 per cent good, and over 1 per cent rich; sandy soils containing less than 0.05 per cent of lime are classified as poor, from 0.5 to 0.1 per cent moderately rich, from 0.1 to 0.2 per cent average or normal. Over 0.2 per cent of lime is not often found in sandy soils.

The minimum percentages of the different mineral elements in the soils of the United

States which, according to Hilgard, chemical analysis has found to be necessary to the thrifty growth of general crops, may be summarized as follows: Potash may vary widely without material effect but should not as a rule be less than 0.25 per cent. One-tenth per cent of phosphoric acid is adequate and there should not be less than 0.05 per cent of it. The greater the proportions of lime and humus and the less the amount of iron in the soil the smaller the percentage of phosphoric acid required. One-tenth per cent of nitrogen is adequate. Lime should not fall below 0.1 per cent in sandy soils nor 0.6 per cent in heavy clay soils. As a general rule the larger the proportion of lime present the lower the percentages of potash, phosphoric acid and nitrogen required. Magnesia is seldom deficient.* Iron is usually present in abundance. Humus, which modern investigation has shown to be a variable complex of many substances and not a definite compound, may vary widely in amount and nitrogen content. The humus of humid soils usually contains a smaller percentage of nitrogen than that of soils of arid regions. Humus is not only important as a source of supply of nitrogen, but also of other plant food constituents—potash, phosphoric acid, lime, etc. According to Snyder, the proportion of these constituents combined with humus represents to a large extent the amounts available in the soil.

An important property of soils, which is partly chemical and partly physical, is their absorptive power for fertilizing constituents, which prevents these constituents from being lost in the drainage or dissipated in other ways before the plant can utilize them. Of the more important fertilizing constituents soils apparently have the least retentive power for nitrogen (especially in the form of nitrates) and the greatest for phosphoric acid. Soils apparently hold lime less tenaciously than potash, since it has been shown that when potassium chloride is added to a soil the potash is retained by the soil and the lime of the soil passes into the drainage in combination with the chlorine.

Physical Properties and Processes.—The physical properties of soils which are of special importance are color, weight, fineness of division or texture, arrangement of particles or structure, adhesiveness, and relations to heat, gases, water and dissolved solids. The physical properties of soils are to such a large extent inherent that the common practice of selecting soils with special reference to the suitability of their physical properties to the crop to be grown is usually a wise one. Nevertheless good tilth with good water conditions, aeration and temperature, as well as an adequate supply of plant food, which are so essential to productiveness, may be modified and improved to a considerable extent by proper management, culture and fertilizing, and with the improved physical conditions the chemical and biological processes of the soil come effectively into play.

The physical properties of soils depend largely upon the relative proportions of stones, gravel, sand, clay, lime, and organic matter present. Sandy soils are as a rule light colored, dry, warm, of low adhesive power, have little

* According to Loew magnesium salts unaccompanied by a certain proportion of lime exert a toxic effect on plant growth.

absorptive capacity for moisture and fertilizing matter, and are generally poor. Clayey soils are more adhesive and have a stronger absorptive power for water and fertilizing matter. They are as a rule wetter, cooler and more difficult to work than sandy soils, but are naturally more fertile. Soils containing a considerable amount of humus are dark colored and light in weight and have a strong absorptive power. Hence, humus soils are frequently wet soils. Lime improves the structure of both sandy and clayey soils, hastens the decay of organic matter, corrects acidity and promotes nitrification and other beneficial bacterial activities.

The color of soils is determined in most cases by the proportions of organic matter and oxide of iron they contain and is of little importance except that it probably affects in some degree the temperature of the soil (see below).

Soils vary widely in weight, as already intimated. Hall gives the following figures:

WEIGHTS PER CUBIC FOOT OF DIFFERENT KINDS OF SOIL.

	Weight per cubic foot Pounds
Heavy clay.....	66.4
Sandy clay.....	80.0
Light loam.....	76.4
Sandy loam.....	76.7
Sandy peat.....	49.0
Light sand.....	79.2

Texture and Structure of Soils.—The productiveness of a soil depends to a considerable extent upon its texture (fineness of particles) and structure (arrangement of particles). These properties determine largely the circulation of water and gases, the solution and retention of plant food and the growth of roots of plants. Good texture and structure thus enable a poor soil to produce better crops than a more fertile soil of which the texture and structure are not so good. One of the main objects of tillage is to promote better soil texture and structure. These properties are affected to a considerable extent by various fertilizers. For instance, lime has the power of flocculating the soil particles and thus renders soils more porous, while sodium nitrate and many other substances have a tendency to puddle the soil, that is, to keep the particles separate and thus prevent the open floccular structure. Soils containing large amounts of clay and other fine particles are most injured by puddling and hence most benefited by flocculating by means of lime.

Relation of Soils to Heat.—The temperature of the surface soil is subject to the same changes as that of the air, but these changes occur more slowly. The variations decrease as the depth increases until they finally disappear. There are several modifying influences affecting the temperature of the soil. The first of these is color. A dark colored soil is usually warmer than a light colored soil. A soil containing much sand or gravel is as a rule warmer than one containing much clay or humus, as already intimated. Soils exposed so as to receive a large amount of the direct rays of the sun are warmer than those not having such exposure. Probably the most important factor determining the temperature of a soil is its water content. A wet soil is cold. Evaporation is a cooling process, and the heat necessary to carry it on

is drawn from the soil, thus lowering its temperature.

Relation of Soils to Water.—The development of plants is impossible without a sufficient supply of water in the soil at all periods of growth. Water is not only an important constituent of plant tissue, but it is of the greatest importance as a solvent and carrier of food in the soil and in the plant. A comparatively small part of that taken into the plant is used to build tissue, the larger part passing out through the leaves by transpiration, which is, however, essential to the healthy growth of the plant. It is estimated that for each pound of dry matter produced in the crop from 250 to 500 pounds of water is drawn from the soil. All soils are capable of absorbing and retaining moisture, but the extent to which they do so varies widely, a fact which is of great importance in determining the mutual adaptability of crops and soils. As a rule the capacity of soils to hold water is proportional to the size of the soil particles, the finer the particles the larger the total surface area of the particles and the greater the capacity for water, although this is not invariably true. King has computed the pore space and surface area of the particles of different kinds of soils as follows:

PORE SPACE AND SURFACE AREA OF PARTICLES IN DIFFERENT KINDS OF SOIL.

KIND OF SOIL	Pore space	Area of surface per cubic foot of soil
	Per cent	Sq. ft.
Finest clay soil.....	52.9	173,700
Fine clay soil.....	48.0	110,500
Loamy clay soil.....	49.2	70,500
Loam.....	44.1	46,500
Sandy loam.....	38.8	36,880
Sandy soil.....	32.5	11,000

Coarse sand allows water to run through freely, retaining relatively little, while fine clay absorbs and retains a large amount. The proportion of organic matter is also an important factor in determining the water-holding capacity of soils, the larger the proportion of organic matter the greater the capacity of the soil for holding water. Healthy root development is not possible in a soil saturated with moisture. The most favorable amount of water for plant growth is stated to be from 40 to 75 per cent of that which the soil is capable of holding when completely saturated. Another important factor to be taken into consideration is that soils vary in the readiness with which they give up water to growing plants when the amount becomes limited. Crops can utilize a larger proportion of the water in open, coarse-grained sandy soils than of that in compact fine-grained clay soils. In other words, plants will suffer from drought on compact clay soils containing a proportion of moisture which would be entirely sufficient for their needs on sandy soils. Thus, while sandy soils have a much smaller total storage capacity for water than clay soils, the available water is more nearly equal in the two cases than would at first be supposed. Sachs found that tobacco plants began to wilt when the water content of sandy soil was reduced to 1.5 per cent, of clay

soils to 8 per cent and of sand and humus to 12.3 per cent.

Water exists in soils in three different states, which may be termed hydrostatic, capillary and hygroscopic. Hydrostatic water is that which fills the soil spaces and would drain away if given opportunity. Its upper surface stands at a certain level, which is known as the water table. Capillary (or film) water is that which is capable of rising in the soil or of moving from a more moist to a less moist part of the soil under the influence of surface tension without regard to the force of gravity. Hygroscopic water is that which closely surrounds the soil particles, but is not affected by gravity and does not move through the soil under the influence of surface tension. Capillary water is often drawn from the hydrostatic supply and is the most important from the standpoint of plant growth. Hygroscopic water is not of great value to vegetation. Heinrich found that plants begin to wilt before the water content of soils is reduced to the hygroscopic limit.

Soil water when present in sufficient amount is constantly in motion. In case of rainfall, irrigation or the melting of snows, the moisture sinks into the soil, carrying along with it oxygen, carbonic acid, nitric acid, ammonia, etc., and rendering plant food available, a part of which may be lost in the drainage if the water supply is excessive. This downward movement or percolation of water due to gravity is most rapid in soils of small retentive power, that is, coarse-grained open soils. Agencies like lime, which flocculate the soil particles and loosen the soil, promote percolation, and those like alkali salts, which tend to compact the soil and puddle its particles, retard it. When the supply of water ceases evaporation commences, and the soil water begins to rise by capillarity, carrying along with it dissolved plant food which accumulates in the surface soil within easy reach of the roots of plants. A harmful accumulation of soluble salts (alkali), however, is thus sometimes brought about in regions of deficient or irregular rainfall.

The capillary properties of soils are of great importance since they determine largely the available water supply of soils. Different soils vary widely as regards the amount of capillary water they retain. Schübler has shown that the water content of a soil is a function of its structure. Coarse sand sometimes retains as little as 15 per cent, while heavy clay loam and soils containing a large amount of humus often retain as much as 50 to 60 per cent. Ordinary loams retain about 40 per cent. As King has pointed out, however, the amount of capillary water actually found in soils in the field are as a rule smaller than the theoretical amounts that the soils are capable of holding, and are controlled to a large extent by the depth of the water table, which is constantly fluctuating. The capillary movement of water has been observed to extend to a depth of seven feet, but declines as the depth of the water table increases. As a rule the amount of capillary water in the soil decreases from the water table upward toward the surface. In the finer soils the moisture as a rule rises more slowly, but to a greater height than in the coarser. The force, surface tension, which causes water to rise in a soil also produces a lateral movement,

but this is much slower than the other. All movements of water become more rapid as the soil approaches saturation.

Under ordinary conditions moisture is constantly escaping from the soil by evaporation. Evaporation may be reduced by tillage and mulching which interfere with the capillary rise of moisture in the soil, and by the use of wind-breaks which lessen the drying effect of winds. The belief is common that the moisture conditions of soils may be materially modified by the use of fertilizers, more especially by the application of common salt, but careful observations and experiments on this point have failed to show any decided effect in increasing the water content of soils by ordinary applications of salt and similar substances.

Colloidal substances, in humus, clay and the like, appear to play an important part in soils, influencing especially their absorptive properties. Unfortunately exact knowledge on this point is comparatively limited and not yet sufficient for generalization of much practical significance.

Biological Action in the Soil.—A large and very important part of the changes which go on in soils is due to biological processes, that is, to the actions of living organisms, including the roots of plants, earthworms and other living agencies, but especially the micro-organisms, generally grouped under the term bacteria. These play an important part in fixing the free nitrogen of the air in the soil for the use of plants, in converting the organic nitrogen of soils into readily available forms by the process of nitrification, or in causing a loss of the soil nitrogen by denitrification. They are also active agents in the disintegration of rocks and the formation of soils; and in the formation of acids from organic matter in the soil, thus rendering the application of lime or other neutralizing agents necessary. It is the object of good soil management to so control the conditions of moisture, aëration, temperatures, etc., that the beneficial biological processes are promoted and the harmful restrained.

Bacterial life is suspended or may be destroyed in very dry soils. Hence the number of bacteria in soils is low after drought and high after rain. Excessive moisture, however, produces conditions (reduced aëration, acidity, etc.) unfavorable to beneficial organisms but favorable to harmful organisms, such as denitrifying bacteria, which cause loss of nitrogen or its conversion into less assimilable forms, and protozoa and similar organisms, which feed on and hence reduce the number of beneficial organisms. Hence it is very important for bacteriological as well as other reasons that soils should be well drained. Bacterial action is more intense and long-continued in warm soils. Bacteria live but are not active in frozen soils. Like the higher plants they are dormant in winter but awaken with renewed life and activity in the spring. The promptness and vigor with which they awake depends upon and in a measure determines whether a soil is "early" or "late." About 25° C. is considered the optimum temperature for the growth of the more important soil organisms. Beneficial organisms do not as a rule thrive in acid soils, hence such soils should be limed to correct the acidity. Excessive alkali

is also harmful. Soils must be well supplied with organic matter (humus) to furnish the food (energy) required by bacteria, and with a certain amount of phosphate, which is also a necessary food. The activity of soil organisms is influenced not only by soil conditions but also by the character of the plants grown on the soil. For example, nitrification appears to be more active under corn than under timothy and mixed grasses, and similar differences have been noted with other crops.

Among the more active and important classes of soil organisms are *molds* which fix nitrogen, produce ammonia and decompose cellulose; *mycorrhiza*, which probably fix nitrogen; *actinomyces*, which decompose organic matter; *algæ*, which manufacture food for *azotobacter*; *protozoa*, which prey upon beneficial organisms; *bacteria*, which oxidize carbon, fix and transform nitrogen and make mineral constituents of the soil available. Many organisms which cause plant diseases also live in the soil and play an important part in determining its productiveness. The destruction of these organisms as well as those that interfere with the growth of beneficial bacteria is of great practical importance from the standpoint of soil sanitation and productiveness. So-called "exhausted," "tired" or "sick" soils are very often simply those in which harmful organisms predominate and their productiveness is readily restored by partial sterilization by means of heat, as in the case of the steaming of greenhouse beds, or by the use of volatile antiseptics like carbon bisulphide, toluol and others.

Soil Toxins.—The theory has been advanced that soils are rendered unproductive by the presence of toxic substances excreted by the roots of plants, produced by bacteria or derived from the decomposition of organic matter. According to Russell "there is no evidence of the presence of soluble toxins in normally aerated soils sufficiently supplied with plant food and with calcium carbonate, but toxins may occur on 'sour' soils badly aerated and lacking in calcium carbonate, or on other exhausted soils. There is no evidence of any plant excretions conferring toxic properties on the soil, but . . . a growing plant may poison its neighbour. . . . Soluble bacterio-toxins are not normal constituents of soils, but must represent unusual conditions wherever they occur. But the possibility of the existence of toxins insoluble in water still remains." Schreiner in his exhaustive study of the organic matter of the soil has isolated a great variety of compounds some of which have toxic properties.

Exhaustion, Improvement and Reclamation of Soils.—Soils are said to be exhausted when they no longer yield profitable crops, but strictly speaking there is no such thing as absolute exhaustion of soils. However, soils decline in productiveness both as a result of loss of fertilizing constituents from the soil and of deterioration in its physical and biological condition.

Among the principal causes of loss of soil fertility are (1) the growth and removal of crops without restoring the equivalent of the fertilizing constituents they contain; (2) surface washing, and (3) leaching. All crops contain a considerable amount of fertilizing mat-

ter drawn from the soil, and it is held that if these crops are grown continuously and sold away from the farm without return of an equivalent in manure or fertilizers the soil will in time show a decline in fertility. The harmful effects of surface washing is a matter of common observation and needs no further discussion here. The loss of fertility in the drainage water is generally supposed to be very considerable, and under certain circumstances this is true, depending upon the character of the soil and the treatment to which it is subjected and the fertilizers applied. "Leachy" soils part very quickly with the fertilizing materials applied to them unless covered with crops which utilize the fertilizers promptly, and, as already shown, certain fertilizers have a tendency to set some of the soil constituents free and throw them into the drainage water.

While these are all possible sources of loss, it is probably safe to say that under ordinary conditions the chances of loss of any considerable amount of lime, potash or phosphoric acid in the drainage water of soils are very small. As regards the loss of the important and expensive fertilizing constituent, nitrogen, however, the case is very different. The soil appears to have very little affinity for one of the forms of this element most commonly used as a fertilizer, namely, nitrate of soda, and if it is not quickly taken up by the crop it is likely to pass into the drainage and be lost. Moreover, other less soluble forms of nitrogen are under favorable conditions rapidly converted into nitrates by the process of nitrification, and so may also be lost in the drainage. Dehérain has reported experiments in which the loss of nitric nitrogen in the drainage from a bare soil in the course of a year was nearly 180 pounds per acre, while the loss from a soil which was kept covered by a crop was almost insignificant, although fully as large an amount of nitrates was formed in the latter case as in the former. Under unfavorable soil conditions there may be considerable loss of nitrogen through denitrification.

Unproductiveness due to physical condition may be corrected by a variety of means, including drainage, irrigation, tillage and by a judicious system of cropping and the proper use of manures and fertilizers.

There are large areas of swamp, marsh or muck soils which prove highly productive when reclaimed. In reclaiming such soils the first essential is thorough drainage. This is not only necessary for the purpose of removing the excess of water, but to allow the free circulation of air in the soil, in order that the poisonous compounds which are usually present may be oxidized and thus rendered harmless, and that the processes of decomposition and nitrification so necessary to render plant food available in this class of soil may be set up. Paring and burning to a depth of 12 to 16 inches as practised in Ireland and in European countries, and the liberal use of manures and fertilizers may often be necessary in addition to drainage, since such soils are as a rule deficient in phosphoric acid and potash, and although composed almost entirely of organic matter they are often deficient in available nitrogen. Lime and the bulky manures often exert a beneficial effect on the texture of the soils, rendering them more porous, and thus improving drainage and

increasing aëration and nitrification. Liberal applications of wood ashes also improve the texture of the soil, correct acidity and favor nitrification, and at the same time furnish potash and phosphoric acid. An application of a mixture of kainit or muriate of potash with some cheap phosphate, such as fine-ground Florida phosphate, may be substituted for the ashes. The untreated mineral phosphates have been used with advantage on muck soils, the decomposing organic matter assisting in rendering the phosphoric acid available.

There are large areas of sandy lands in different parts of the United States which are extremely deficient in plant food, but which prove very valuable for a variety of purposes, but especially for early crops, when they are properly managed. One of the first requirements of such soils is an increase of humus to improve their water-holding capacity. The most effective means which has been found for increasing the humus supply in such soils is the growing and turning under of green crops, preferably leguminous plants, which are nitrogen collectors. Moderate liming has also been found beneficial in many cases.

Methods of Investigation.—Three principal methods are employed in studying the characteristics and requirements of soils, namely, (1) mechanical and chemical analysis; (2) experiments in lysimeters, pits, pots or boxes, and (3) field experiments. The nature of the methods pursued in the chemical investigation of soils has already been indicated. The object of mechanical analysis is to separate the soil into particles of different degrees of fineness so that a basis may be secured for judging of the physical properties of the soil. Mechanical analysis as ordinarily practised separates a soil into what is termed skeleton (consisting of coarse particles like gravel and coarse sand larger than 0.5 millimeter in size) and fine earth, which includes all particles passing a sieve with meshes 0.5 millimeter in diameter. The fine earth is further separated into some six different grades, ranging from medium sand with particles 0.25 to 0.5 millimeter in diameter, through fine sand, silt, to clay, the particles of which are less than 0.005 millimeter in diameter. The methods of mechanical analysis which have been employed are of three classes: (1) hydraulic (Hilgard, Schöne, Nöbel); (2) sedimentation (Osborne, Schloesing, Knop), and (3) centrifugal. The methods which have been most commonly used in the United States are modifications either of Osborne's beaker (sedimentation) method or Hilgard's elutriator (hydraulic) method. The physical examination of a soil also involves determinations of water-holding capacity, rate of percolation, capillary rise, hygroscopicity, adhesive power, etc., for all of which ingenious methods have been devised.

Soil Surveys.—The soils of the United States have been studied to a considerable extent by the agricultural experiment stations, but while the work of the stations on soils has been quite varied and extensive it has not been systematic. The need for systematic and concerted study of soils has, however, been met by the organization and development of the work of the Bureau of Soils of the United States Department of Agriculture, which under-

takes the survey, mapping and study of soils on a scale never before attempted. In the inauguration of this work "it was recognized that differences of commercial value could be seen in the field from the character of the soil and from its relation to crops and vegetation; that it was quite possible to map these soil areas independently of the geology of the area or the exact chemical or physical character of the soil; that the proper course was to construct maps in the field, showing the area and distribution of the soil types; to explain as fully as possible from geological considerations the origin of the soil, and to have the soil chemist and physicist study the differences in the soil types." Note is also made of climatic and economic conditions which may significantly affect the cropping practice. Extensive laboratory investigations supplemental to the field operations are conducted with a view to determining the chemical and physical properties of soils, improving methods and working out a more clearly defined classification.

In Germany elaborate soil surveys with reference to physical and chemical properties and productive and taxable value of the land have been made under government auspices by the "Laboratorium für Bodenkunde" at Berlin. A systematic chemical survey of the soils of Belgium was undertaken under the direction of the Gembloux Station. In France soil surveys have been undertaken by several of the departments, the soils being mapped with reference to their crop adaptations and fertilizer requirements. In Russia soil surveys have been successfully prosecuted in several of the governments, and Japan has made considerable progress in work of this character.

SOIL, Physical Properties of. See **SOIL SURVEY.** See **SOIL.**

SOILING, the system of feeding grazing animals, especially cattle, in barns and other enclosures, with freshly cut green crops grown for the purpose, instead of turning them out to pasture. The practice has its most important application in intensive farming and on small farms as in Europe, but is also practised in other regions where the agricultural resources are undergoing development from extensive to intensive methods. In many parts of Europe the animals are soiled during the whole year, never being allowed to graze at all. In the older parts of America and Australia this is also true to some extent; but generally in these newer countries the practice is combined with pasturing, the animals being usually kept in the barns during the day to reduce annoyance from flies, and turned out to graze at night fall. It is also true in America that the animals are more seldom fed in barns even during summer than in Europe. However, dairy cattle, especially in the vicinity of cities, are frequently kept in the stables and fed there the year around with soiling crops, supplemented with hay, grain and other dry feeds. This practice appears to be growing in popularity.

In America soiling first began to attract attention about 100 years ago, though not until the middle of the past century did it begin to gain ground rapidly, due mainly to the growth of population and the consequent increase in the values of land, more especially in the north-eastern quarter of the United States and adjacent Canada. Agricultural literature shows that at that time the plants most favored were the taller growing fodder crops such as timothy, red clover, oats, cabbage and various roots, especially mangels, turnips and carrots. While all these are more or less popular at the present time millet, rape, sorghum, Kaffin corn, crimson clover, cow peas, soy beans, and alfalfa and combinations of Canada field peas with oats, or barley, and winter vetch with rye have more than supplemented, well nigh supplanted, them in general favor. This is mainly because these crops cover the whole season more completely than the former list and also yield larger quantities of fodder on given areas. Especially is this the case with alfalfa which not only may be cut several times, thus yielding heavily, but the green material is notably rich in muscle and milk-forming compounds.

In the Middle West where areas are less restricted than in the East and where natural grasses are abundant, pasturing rather than soiling is the vogue. But even here the newer practice is gaining headway in the vicinity of cities because of its economy and expediency. There as elsewhere a larger number of animals may be sustained by an equal area in pasturage. When the animals are confined the expense of erecting and maintaining fences is eliminated, except for small paddocks. The waste of food due to trampling and defiling with manure is avoided. The animals may always be assured of abundant food. The manure may be evenly distributed, especially when mechanical spreaders are used, thus preventing the too abundant deposits in some parts of the field, the almost entire lack in others and the irregular distribution between these two extremes. Except for the increased labor of handling the food and the manure the system has no serious disad-

vantage, though it is claimed that animals thrive best where they are allowed exercise; but this may be secured in summer at least by the freedom of a paddock, preferably at night. For this last reason soiling and pasturing are commonly combined in the United States, the pasture being kept as remote as convenient from the crop fields so the animals may not become restive and be tempted to break through the fences.

Experiments have been tried in soiling and bulletins published by various experiment stations, more especially those of the East. The Bureau of Animal Industry of the United States Department of Agriculture has also issued information on this subject.

M. G. KAINS,
Horticultural Consultant.

SOISSONS, swā-sōn, France, a city in the department of Aisne, 51 miles northeast of Paris on the Aisne River. It is an episcopal see and the old cathedral (12th century) contains a library, with a valuable collection of manuscripts. Here stands the venerable abbey of Saint Jean des Vignes (1076), where Thomas à Becket sought refuge when exiled; the Romanesque church, Saint Peter (12th century); Notre Dame and Saint Léger. The chief secular buildings are a museum of antiquities and a public library, with 30,000 volumes; besides a college and two seminaries and a hospital. There are interesting Roman antiquities, including the ruins of a large amphitheatre, coins, mosaics, sculptures and vases. Near the suburb of Saint Vaast lies the village of Saint Médard, the site of a revered abbey with seven churches, a famous place of pilgrimage. Soissons has oil-mills, stocking factories and tanneries and a large trade in grain, flour and beans. The town has been the scene of many important historical events, the battle ground of fierce armies and was largely devastated in the great World War. See WAR, EUROPEAN.

SOJOURNER TRUTH, American abolitionist: b. Ulster County, N. Y., about 1775; d. Battle Creek, Mich., 26 Nov. 1883. She was born a slave and received the name of Isabella Hardenberg. That of Sojourner Truth she claimed to have been revealed to her by God as designating her mission in the world. By the act of the New York legislature of 1827 abolishing slavery in that State she became free and, having gone to New York, was brought to the attention of Susan B. Anthony and other well-known abolitionists and reformers. Encouraged by them, she began her career as a public lecturer, at first upon the slave question and, after the emancipation of her people, as an advocate of women's rights and in the cause of temperance. For many years she endeavored to secure from the government of the United States a grant of public lands for the establishment of a negro colony.

SOKOLOW, Nahum, Russian Hebrew journalist: b. Wishograd, government of Plock, Russian Poland, 10 Jan. 1859. He early displayed remarkable intellectual gifts and in 1884 after receiving a careful education he became assistant editor of *Ha-Zefirah* at Warsaw. The publication was later changed to a daily and he became editor and manager. After the death of the owner, Slonimski, in 1904, he was owner as

well as editor. He was a prolific writer for the Hebrew press and after 1896 was also editor of the Polish weekly *Israelita*. He is generally regarded as the foremost Hebrew journalist in Russia. He founded the yearbook 'Ha-Asif' and its successor, 'Sefer ha-Shanah' (1899-1902). After long hesitation he joined the Jewish Nationalist movement. During the European War he made his home temporarily in London. Author of numerous works, among which may be mentioned 'Le-Maranan we-Rabanan' (1900); 'Tochen ha-Ziyonat' (1912), etc. In 1919 he was engaged in completing his only work in English, 'History of Zionism' (2 vols.), of which one volume has been published.

SOKOTO, sô-kô'tô, Nigeria, Central Africa, (1) the former a capital of the government of the same name, situated on a long ridge, 18 miles east of Warnu, which forms a joint capital. It is surrounded by a wall and is well built in Moorish style. There were at one time important manufactures of muslin, shoes, iron-work, etc., and a population of 80,000, but this has now dwindled to 1,500. (2) A semi-dependent native government, bounded by Sudan on the north, the river Benue on the south and on the east and west by the native kingdoms of Bornu and Gandu, respectively. Its area is about 100,000 square miles. The general relief is flat, but in the province of Adamawa rises to an altitude of 10,000 feet. It is well watered and there are large deposits of excellent iron ore. The ruling race is the Fulah. Their subjects—the Hausa and various negro tribes—form the population. In 1885 the sultan of Sokoto put his kingdom under the protectorate of Great Britain and granted to the Royal Niger Company the monopoly of trade. In 1902 the British assumed control, and suppressed a rebellion. The principal town is now Kano.

SOL-FA, TONIC SOL-FA, or MOVABLE DOH, SYSTEM, a modern scientific method of classifying, explaining and teaching the facts of music, of especial value in the acquisition of the art of sight-singing. The system proceeds on the principle of giving the chief prominence to the fact that there is in reality but one scale in music, which is raised or lowered according to the pitch of the key. The seven notes of the diatonic scale are represented by the solfeggio (q.v.) syllables, or rather modifications of them — DOH, RAY, ME, FAH, SOH, LAH, TE; DOH standing for the keynote in whatever key the music is written. In the early exercises the pupils are accustomed to a scale or diagram, called the Modulator, representing pictorially the exact intervals of a key, with the semitones in their proper places. In written music only the initial letters of the solfeggio syllables are used—

f
m'
r'
d'
te
lah
se
soh
fe
fah
me
ray
doh
t
l
a
f
m

Modulator.

d, r, m, f, s, l, t; the higher octaves of a given note being distinguished by a¹ above, as d¹, r¹; and the lower by a₁ or s₁ below, m₁, m₂. The name of the key is prefixed to a tune as its signature, as "Key A," "Key B flat"—the keynote being, in all the major keys, DOH. To indicate rhythm a per-

pendicular line | precedes the stronger or

louder accent, a colon: the softer accent and, where necessary, a shorter perpendicular

line | the accent of medium force. A note

immediately following an accent mark is supposed to occupy the time from that accent to the next. A horizontal line indicates the continuance of the previous note through another pulse or beat. A dot divides a pulse into equal subdivisions. A dot after a mark of continuance indicates that previous note is to be continued through half that pulse. A comma indicates that the note preceding it fills a quarter of the time from one accent to the next; a dot and comma together three-quarters. An inverted comma ' is used to denote that the note preceding it fills one-third of the time from one accent to the next. An unfilled space indicates a rest or pause of the voice. A line below two or more notes signifies that they are to be sung to the same syllable. The following example of the tonic sol-fa shown alongside of the ordinary notation, illustrates most of the features named.

In modulating into a new key the note through which the transition is taken is indicated by a combination of the syllabic name which it has in the old key with that which it has in the new—me lah, for example, being conjoined into m'lah, and in writing this note (termed a bridge note) the initial letter of its syllable, as a member of the old key, is placed in small size before and above the initial of the syllable of the new, as m^l 'a. In the case, however, of an accidental, where the transition is but momentary, a sharpened note changes its syllabic vowel into e, and a flattened note into aw, spelled a, as fah, fe, soh, se, te, ta. In the minor mode lah is the keynote; the sharp sixth is called bay and the sharp seventh se. The signature of the key of A minor is "Key C"; lah is A.

The method of teaching is of equal importance with the notation itself. For a full explanation of this system, consult Curwen, 'Course of Lessons and Exercises in Tonic Sol-fa.' Its advocates maintain that it possesses advantages over the common system in the facility of its acquisition; the distinctness with which it indicates the keynote and the position of the semitones; the cheapness with which it is printed; and the manner in which, they say, it explains the proper mental effects of notes in harmony and key-relationship and em-

plays them in teaching. It has, however, been objected to by others, from its withdrawal of the direct indication of both absolute and relative pitch to the eye which exists in the common notation, from its limited applicability to instrumental music and from its acquirement not being, like that of the ordinary notation, an introduction to the world of musical literature. It presents, however, no barrier, but rather a road to the acquisition of the older notation; and its widespread use and the testimony of the general body of practical teachers are eloquent arguments in its favor.

In the history of music various attempts have been made to introduce a musical notation in which the staff with its lines and spaces is dispensed with. Jean Jacques Rousseau suggested, but afterward discarded, a notation where the notes of the scale were indicated by the Arabic numerals—a principle which is the chief feature of the Chev  system, largely used in France, the time-names of which have been adopted by the Tonic Sol-fa system. The latter system, similar to Rousseau's in its leading features, has been promoted chiefly by the Rev. John Curwen (q.v.), who obtained his main principles about 1840 from Miss Glover, a teacher at Norwich. It was brought into almost general use in the singing schools of Great Britain and her colonies and later into the United States with moderate success. The London Tonic Sol-fa College was founded in 1869.

SOLAN GOOSE, the common gannet (q.v.).

SOLANACEÆ, the nightshade family, an order of plants containing about 1,500 species arranged in 70 genera, mostly herbs and shrubs widely distributed in warm climates, and especially in tropical America. They are usually malodorous and are characterized by alternate, lobed or undivided leaves, monopetalous flowers of various colors and sizes arranged in various ways—fascicles, cymes, solitary and followed by two- to many-celled fruits with numerous seeds. The order is of wide economic importance, since it contains several leading food-plants, such as the potato, tomato, tobacco, cayenne, red or garden pepper and various weeds and garden plants, as the petunia, jimson-weed, mandrake and others. The typical and foremost genus is *Solanum*, of which more than 500 species have been described, mostly natives of tropical America. They are smooth, downy or spiny plants with white or blue axillary flowers borne singly, in cymes, or in fascicles, followed by roundish two-celled berries containing many kidney-shaped seeds. The principal species is *S. tuberosum*, the common potato (q.v.), in which, as in many other members, is found an alkaloid, solanin, reputed to produce unpleasant physiological effects when the plants are eaten to excess. *S. melongena*, the egg-plant, is another leading food-species. It was formerly regarded as noxious; on which account Girarde (1597) entreates his countrymen to eschew it. *S. aviculare* or *laciniatum* is the kangaroo apple of Australia and New Zealand, where its fruits are eaten. *S. muricatum*, the pepino, melon-pear or melon-shrub, yields an edible fruit suggesting an acid-flavored egg-plant fruit. It is grown to a small extent in the United States. The fruits of several East

Indian species are eaten either alone or in curries, etc. Two European species, *S. nigrum*, the common nightshade, and *S. dulcamara*, the bitter-sweet, are common weeds in the United States. The horse nettle (*S. carolinense*) and *S. rostratum* are native, spiny weeds. Several species were formerly used in medicine and still are in the Orient. *S. saponaceum* yields berries which are used as a substitute for soap. Several species, particularly *S. jasminoides*, the potato vine, and *S. seaforthianum*, are popular greenhouse plants of easy culture.

SOLANINE ($C_{27}H_{45}NO_8$), a substance obtained from the *Solanum mammosum* of the Antilles. It is also found in the berries of the *S. nigrum*, as well as in the leaves and stems of bittersweet (*S. dulcamara*). To obtain it ammonia is poured into the filtered juice of the berries, when a grayish matter falls down, which is collected on a filter, washed and treated with boiling alcohol. The solanine precipitates from this by evaporation. It is an opaque, white, somewhat pearly-looking powder; without smell; very bitter; fusible below 100° C.; decomposable at a higher temperature; insoluble in water, ether, oil of olives and essence of turpentine; but very soluble in hot alcohol, from which it crystallizes in slender, silky needles. It combines with acids, forming salts. It is eminently emetic, and even in small doses is poisonous.

SOLAR CORONA, in astronomy, the portion of the aurora observed during total eclipses of the sun, which lies outside the region of colored prominences. The region of colored prominences is called the chromosphere. See SUN.

SOLAR CYCLE. See CHRONOLOGY.

SOLAR ENGINE. See SOLAR MOTOR.

SOLAR MICROSCOPE, an instrument by means of which a magnified image of a small transparent object is projected on a screen, the light employed being sunlight. The solar microscope is really a magic lantern, in which the microscopic object is affixed to a clear plate, and the light employed bright sunlight reflected into the instrument. The reflector being adjusted throws the sun's rays into a tube set in a window shutter, closed to exclude the light. A double lens focuses the image on a second system of lenses, which throw it upon the screen. See MICROSCOPE, SOLAR.

SOLAR MOTOR, a mechanism for securing motive power from the sun. For many years the attention of inventors has been directed to the question of utilizing the direct rays of the sun as a substitute for coal, wood or other fuel; large burning-glasses or reflectors being the general form of the various machines. A so-called "burning mirror," made in France by Villette, was four feet in diameter, and produced so intense a heat that, according to the report, it melted cast iron in 16 seconds, probably an exaggeration. It was for a long time difficult to build a concave mirror of very large size, but this was finally overcome by having the surface of the concave mirror covered with small pieces of glass, or mirrors, each of which is so placed that the light or reflection from each side is thrown upon the same spot, the sum total, or the amount of heat centralized, being equivalent to the amount reflected by

each glass, multiplied by the number of mirrors. In Europe the early solar glasses were generally of two kinds; that is, the heat was concentrated in two ways — by reflection from polished concave mirrors and by refraction through a convex lens. The earliest use, centuries ago, of such a contrivance was theoretically to dazzle or blind an enemy, metal discs being employed; but nearly all such devices failed to be of any practical value. Sir William Herschel experimented with the sun's heat in Africa; and Captain Ericsson made a number of studies in this direction and exhibited a solar motor in New York in 1884.

Within recent years a successful sun motor has been built at South Pasadena, Cal., and here is an automatic engine run by the heat of the sun. In appearance the motor resembles a huge dish of glass, with a central aperture, and at a distance might be taken for a windmill; but the dish is a reflector 33 feet in diameter. The inner surface is made up of 1,788 small mirrors, arranged so that they concentrate the sun upon the central or focal point. Here is suspended the boiler, which is of tubular form and 13 feet long, holding 100 gallons of water, leaving eight cubic feet for steam. The motor is attractive in appearance; built lightly, supported by seeming delicate shafts, though in reality strong enough to resist a wind pressure of 100 miles an hour. The reflector must face the sun exactly, and as heavy as it is, weighing tons, it can be easily moved. It stands, after the fashion of the telescope, upon an equatorial mounting, the axis being north and south; the reflector follows the sun, regulated by a clock, the work being automatic, as, in fact, is everything about it. The true focus is shown by an indicator, and in about an hour after it is adjusted in bright sunlight the steam gauge will register 150 pounds. The steam is carried from the suspended boiler to the engine in a flexible tube and returns again from the condenser to the boiler in the form of water, so that the boiler is kept automatically full. The engine is oiled automatically, and when the dish is once turned, facing the sun, it runs all day independent of an engineer as does a windmill, developing about 12 horse power. While the motor is most interesting to engineers, it has not demonstrated the practicability of the system in competition with the ordinary steam engine or electric power brought from a distance.

SOLAR PARALLAX. See PARALLAX.

SOLAR STAR. See STARS.

SOLAR SYSTEM. that collection of bodies of which the earth on which we dwell is one, and which are distinguished from all other bodies in the universe by having the sun as the centre of their motions. The bodies of this system may be classified as follows:

1. **The Sun.**—The great central body, shedding its light and heat on all the other bodies and by its powerful attraction, keeping them in their several orbits. It is the fountain-head of all life on the earth. It is about 750 times as massive as all the other bodies of the system put together; hence its attractive power on all these bodies. For a full description of this great luminary, see SUN.

2. **The Planets.**—Bodies which revolve round the sun in elliptic orbits, generally differing

little from circles. The planets are opaque and are, therefore, visible to us only by reflecting the light of the sun. They are divided into two classes, *major* and *minor planets*.

The major planets are eight in number; their names, distances and many other particulars respecting them will be found in the table appended to this article. It will be seen that the most distant, Neptune, is more than 70 times as far from the sun as the nearest, Mercury. An idea of the arrangement of the planets will be gathered from the accompanying plate.

It will be noticed by the plate that there is a gap between the orbits of Mars and Jupiter. This is filled by the second class of planets, called *minor planets* or *asteroids*. These bodies are much smaller than the major planets and generally revolve in more eccentric orbits. It is impossible to say exactly how numerous they may be; more than 800 are now known, new ones constantly being discovered, and there may be hundreds, or even thousands, so small that they have not been discovered, and may never be separately recognized. See ASTEROIDS.

3. **The Satellites of the Planets.**—All the major planets, with the exception of the two inner ones, have one or more smaller bodies revolving round them and accompanying them in their courses round the sun. In this respect each of the planets having satellites may be said to form a solar system in miniature, since the motion of the satellites round the planet is quite similar to that of the latter round the sun. The number of satellites is as follows:

	Satellites
The Earth	1
Mars	2
Jupiter	9
Saturn	10
Uranus	4
Neptune	1

There are, therefore, 27 satellites now known. The system formed by a planet and its satellites is designated by the name of the planet. Thus we have the Martian System, the Jovian System, the Saturnian System, etc.

4. **Comets.**—Comets generally revolve in orbits so eccentric that, during the greater part of their course, they are entirely invisible, even to telescopic vision. A few are known to revolve within the orbit of Jupiter, and all that we can observe must have their perihelion not more than two or three times as far as the earth's orbit — otherwise they would be forever invisible. Their times of revolution vary all the way from three years to unknown thousands of years. Those having long periods go far beyond the orbit of Neptune during their course. No limit can be set to their number. Kepler's remark that the heavens may be as full of comets as the sea of fish, though probably an exaggeration, is well fitted to give an idea of the possible number of these bodies. It is certain that only an insignificant fraction of the total number has ever been seen by human eye. See COMETS.

5. **Meteorites or Meteors,** which must be countless millions of millions in number, are so minute that we never see them individually except when they strike our atmosphere and form a shooting star. (See SHOOTING STARS). They may be classed with comets, because the latter are probably of meteoric constitution; perhaps made up of meteors.

6. **The Zodiacal Light**, which is a great lens-shaped cloud of small particles surrounding the sun and extending nearly to the orbit of the planet Mars. This cloud is thickest at the sun, but has a region of reversed curvature within the orbit of Mercury. Its form may be quite closely represented by two ellipsoids of revolution, having the centre of the sun for their common centre, the eccentricity of the inner being about 0.25, and the outer having the form of a thin, ellipsoidal sheet, within which the innermost planets are immersed.

A remarkable feature of the solar system is the clear separation of the eight major planets into two groups, equal in numbers, each comprising four planets with distinctive characteristics. The inner four, of which our earth is one, are dense and highly compressed solid bodies. The four planets of the outer group are many times more massive than the inner ones, the least massive of all, Uranus, being seven or eight times as weighty as the four inner ones put together. As compared with the inner group, the planets of the outer group are also distinguished by being larger in a yet greater proportion than they are massive. Any one of the inner group would be a small object alongside the smallest of the outer group. A similarity of constitution also seems to mark the outer planets; it is highly probable that all are surrounded by dense atmospheres—in fact, that each consists of a comparatively small nucleus surrounded by a gaseous envelope with clouds floating in it as they do in our atmosphere.

Possible Unknown Planets.—The excessive motion of the perihelion of Mercury, as well as smaller, but well-defined motions in the node of Venus and the perihelion of Mars, none of which could be accounted for by the disturbances caused by the attractions of the known bodies of the solar system, long ago led to the suspicion that there might be one, or even a ring of, undiscovered planets revolving about the sun within the orbit of Mercury. Should such planets exist they ought, from time to time, to pass between us and the sun, so as to be visible on the disc of the latter. Several observers, studying the sun, have supposed that they saw such objects. But there is no doubt that they were mistaken. For 20 years past the sun has been photographed almost every day, as well as constantly scanned by the telescope, in Europe and in America. No photograph has ever shown, and no really experienced observer has ever seen anything of the sort. Another way of detecting such bodies would be by scanning the neighborhood of the sun during total eclipses. This has been done at almost every such eclipse, during the last 30 years. Moreover, in recent times, photography has been called to the aid of the search, especially by the Lick Observatory, in California. In one of the attempts, stars were photographed down to nearly the eighth magnitude; but nothing was ever found except known stars. We may, therefore, regard the non-existence of any visible planet between Mercury and the sun as well proved.

In addition to this, the most interesting discovery was made by Seeliger in 1906 that the outstanding discrepancies in the motions of the planets can be fully accounted for by the disturbing pull of the zodiacal light, provided that

we ascribe to this only an almost inconceivable tenuity. It is sufficient to assume that the densest portion has but 2.52 by 10^{-21} times the density of the sun in order that its mass may be great enough to produce the disturbances observed. Moreover, it is found that on this assumption no new disturbances are introduced into the perturbations of any of the planetary elements of a size great enough to be evident to observation.

The question whether there may be a planet beyond Neptune is not so easily settled. The probable existence of such a body has been inferred on three grounds: (1) Outstanding discrepancies in the computed motion of Uranus; (2) the existence of certain comets, the aphelia of whose orbits lie outside the orbit of Neptune; and (3) the inference, based on the planetesimal theory of the development of the solar system, that the orbit of the outermost planet will not be a nearly circular one. Of these, the first furnishes the most reliable evidence and it alone can serve as a basis for predicting the planet's position and so leading to its discovery, if, indeed, it has an existence. In the course of a century, accurate observations of Uranus will have accumulated throughout the entire circuit of its orbit, and by this time also the motion of Neptune will have been sufficient to indicate the position of the planet. As yet, however, an accurate indication is not possible, and careful search for the body has met with no success. It is inferred that it is from the 12th to the 13th magnitude, with an apparent diameter of perhaps 1"; as it is so far distant from the sun, its motion among the stars is certainly very slow, and all of the circumstances contribute to render its discovery extremely difficult.

The planets are all so distant from us that, to the naked eye, they appear like stars. For the most part the five nearest to us would be classed among the brightest of the stars, Venus and Jupiter being generally brighter than any fixed star. They are also distinguished from the stars by their apparent motions, which may be seen by watching them from night to night. Their apparent situations relatively to the sun are called *aspects*. The latter are different according to whether the orbit of the planet is inside or outside that of the earth; that is, whether it is an inferior or superior one. A glance at the arrangement of the system will show that the inferior planets, Mercury and Venus, can never be seen in the opposite direction from the sun, but only seem to swing back and forth on each side of the sun as they perform their revolutions around this luminary. Their apparent distance east or west from the sun at any time is called their elongation. At the greatest elongation, Venus is about 45 degrees from the sun, and Mercury at different distances, generally ranging between 20 and 30 degrees, according to its position in its very eccentric orbit. But the superior planets seem to course relatively to the sun all the way round the sky in performing their revolution. When in the opposite direction from the sun they are said to be in *opposition*. This is the most favorable time for observing them, because they are then nearest to the earth, and their visible hemisphere is fully illuminated. They then rise about the time of sunset, and cross the meridian about midnight.

2000

The inferior planets pass by the sun during their apparent swinging from one side to the other. When they pass on our side of the sun they are said to be in *inferior conjunction*; when beyond the sun, in *superior conjunction*. These conjunctions take place at fairly regular intervals. The best time to see an inferior planet is in the evening, some time before inferior conjunction; or in the early morning twilight, some time after it.

The plate shows the most important relations existing among the elements of the planets. The elements of the planets are given in the following tables:

PLANET	Distance from the Sun			Distance from the Earth		Time of revolution round the Sun	Synodic revolution
	Mean	Greatest	Least	Greatest	Least		
	Miles	Miles	Miles	Miles	Miles	Mean solar days	Mean solar Days
Mercury.....	36,000,000	43,400,000	28,600,000	134,800,000	50,900,000	87.9693	115.887
Venus.....	67,200,000	67,700,000	66,700,000	161,200,000	24,500,000	224.7008	583.920
The Earth.....	92,900,000	94,500,000	91,300,000			365.2564

SIMON NEWCOMB.

SOLAR TIME. See DIAL; SUN.

SOLARIO, sô-lă-rê-ô, **Andrea da**, Italian painter: b. about 1460; d. 1515. He lived in Venice (1490-93) with a brother, Cristoforo, who was an architect and sculptor. His work was modeled after Leonardo da Vinci, and in 1507 he was called to Normandy to execute work offered Da Vinci. His best known works are 'Ecce Homo'; 'Repose in Egypt' (1515); 'Crucifixion' (1503); a 'Madonna' and 'John the Baptist.'

SOLARIO, Antonio, Italian painter: b. at Civitâ, about 1380; d. 1455. He studied in Bologna, Venice, Florence and Rome, but practised his art mainly in Naples. His chief work consists of 20 large frescoes in the monastery of Saint Severino. His backgrounds are said to have been superior to his figures.

SOLBERG, Thorvald, American writer: b. Manitowoc, Wis., 22 April 1852. As a member of the staff of the Library of Congress in 1876-89 he became interested in the question of international copyright and was a delegate

to the several European congresses. His most notable works are 'International Copyright in the Congress of the United States' (1886), and 'The Copyright Law in Force in the United States in 1900' (1900).

SOLDANELLA, in botany, a genus of plants of the order *Primulacea*. They are small herbs, inhabiting the alpine districts of southern Europe, corola sub-campanulate, of one cleft and fringed on the margin. *Soldanella alpina* having blue flowers, frequenting the hills of Switzerland, is an object of extensive culture in England.

SOLDER, sôd'er, a fusible alloy of metals employed to join or unite metals. The principle involved is that the molten alloy applied shall partly fuse the metal surfaces, thus creating a metallic union. As a rule, the solder should be easier of fusion than the metal to which it is applied. The solder should also be of or near the same color as the metal. For fine steel, copper and brass work gold or silver may be employed. But, broadly speaking, iron is soldered with copper, and copper and brass with tin. The most usual solders are the compound, which are distinguished into two principal classes, hard and soft. Any solder that requires a red heat for melting is termed a hard solder; these are ductile, will bear hammering and are commonly prepared of the same metal as that which is to be soldered, with the addition of some other, by which a greater degree of fusibility is obtained, though the addition is not always required to be itself easier of fusion. Under this head comes the hard solder for gold, which is prepared from gold and silver, or gold and copper, or gold, silver and copper. The hard solder for silver is prepared from equal parts of silver and brass, but

is made better for fusion by the admixture of 1-16 of zinc. The hard solder for brass is obtained from brass mixed with a sixth or an eighth, or even one-half of zinc, which may also be used for the hard solder of copper. The soft solders, melting below a red heat, are much used in plumbing and tinning; they melt easily, but are usually brittle and, therefore, cannot be hammered. Tin and lead in equal parts make a good soft solder. Of easier fusion is that consisting of bismuth, tin and lead in equal parts. In the operation of soldering, the surfaces of the metal to be joined must be made very clean and applied to each other. It is usual to secure them by a ligature of wire or other device. The solder is laid upon the joint, together with sal-ammoniac and borax or common glass, according to the degrees of heat intended. These additions defend the metal from oxidation. Glaziers use resin, and pitch is sometimes employed. Tin-foil, applied between the joints of fine brass work, first moistened with a strong solution of sal-ammoniac, makes an excellent juncture, care being taken to avoid too much heat. It was at first found very difficult to solder aluminum, but a satisfactory solder was found in an alloy of gold, silver and copper, to which some add a little zinc. Soft solder is applied with a soldering iron, or in some cases with a machine as in closing fruit cans. The regular soldering iron has a pointed copper head and a wooden handle. In use the copper head is heated almost to redness and having been carefully cleaned and scraped, it is used to pick up some of the molten solder and apply it to the work. The surface or edges to be soldered must be quite clean and bright and the process is assisted by a flux, as of resin or chloride of zinc. Hard solder is essential for joining steel, iron gun metal, brass, etc., and permits a much stronger joint than soft solder. The process of applying hard solder is often called brazing, from the similarity of the alloy used to brass. Common mixtures are copper 60 and zinc 40, for soldering iron; copper 40 and zinc 60, for copper and hard brass; silver 30, copper 50 and zinc 20, for soldering silver, brass, gold and some irons. See ALLOYS; WELDING.

SOLDIERS OF FORTUNE. See MERCENARIES.

SOLDIER BEETLE, the name given to the beetle of the tribe *Telephoridi*, family *Malacodermidae*. The larvæ generally feed upon plant-lice, caterpillars or other soft-bodied insects. The most common species in the eastern part of the United States is the *Chauliognathus pennsylvanicus*, a native of Pennsylvania, which are specially valuable as cross-fertilizers of plants.

SOLDIERS' HOMES, the general name of various institutions in the United States, under national or State control, for the care of sick and disabled soldiers and sailors. These homes were the direct outcome of the Civil War. The Federal institution is known as the National Home for Disabled Volunteer Soldiers and has branches at Dayton, Ohio; Milwaukee, Wis.; Togus, Me.; Hampton, Va.; Leavenworth, Kan.; Santa Monica, Cal.; Marion, Ind.; Danville, Ill.; Johnson City, Tenn., and Hot Springs, S. D. In 1903 the aggregate number of

inmates was about 27,000; in 1917 it was 32,000. The total number cared for up to and including 1917 is about 200,000.

The requirements for admission are: (1) An honorable discharge from the United States service. (2) Disability which prevents the applicant from earning his living by labor. (3) Applicants for admission will be required to stipulate and agree to abide by all the rules and regulations made by the board of managers or by its order; to perform all duties required of them and to obey all the lawful orders of the officers of the Home. Attention is called to the fact that by the law establishing the Home the members are made subject to the Rules and Articles of War and will be governed thereby in the same manner as if they were in the army of the United States. (4) A soldier or sailor must forward with his application for admission his discharge paper and when he is a pensioner, his pension certificate and if he has been a member of a State home, his discharge from that home, before his application will be considered; which papers will be retained at the branch to which the applicant is admitted, to be kept there for him and returned to him when he is discharged. The rule is adopted to prevent the loss of such papers and certificates and to hinder fraudulent practices, and no application will be considered unless these papers are sent with it. If the original discharge does not exist, a copy of discharge, certified by the War or Navy Department, or by the adjutant-general of the State, must accompany the application.

The United States Soldiers' Home at Washington, D. C., receives and maintains discharged soldiers of the regular army. All soldiers who have served 20 years as enlisted men in the army (including volunteer service, if any) and all soldiers of less than 20 years' service who have incurred such disability, by wounds, disease or injuries in the line of duty while in the regular army, as unfits them for further service, are entitled to the benefits of the Home. A pensioner who enters the Home may assign his pension, or any part of it, to his child, wife or parent, by filing written notice with the agent who pays him. If not so assigned it is drawn by the treasurer of the Home and held in trust for the pensioner. The board of commissioners consists of the general-in-chief commanding the army, the surgeon-general, the commissary-general, the adjutant-general, the quartermaster-general, the judge-advocate-general and the governor-general of the Home. About 1,500 old soldiers occupied the Home in 1917.

There are State homes for disabled volunteer soldiers provided by 27 of the States and New York, New Jersey, Washington and Nebraska each maintain two such homes.

Confederate soldiers' homes have been established in Atlanta, Ga.; Austin, Tex.; Beauvoir, Miss.; Columbia, S. C.; Hermitage, Tenn.; Higginsville, Mo.; Jacksonville, Fla.; Little Rock, Ark.; Mountain Creek, Ala.; New Orleans, La.; Pewee Valley, Ky.; Pikesville, Md.; Raleigh, N. C.; Richmond, Va.; Washington, D. C. There are of course very few veterans remaining to occupy them.

SOLDIERS THREE, by Rudyard Kipling, is thus well described in the title-page of the

original edition, printed in 1888 in Allahabad by the Pioneer Press as Number 1 of A. H. Wheeler and Company's Indian Railway Library: 'Soldiers Three.' A Collection of Stories. Setting forth Certain Passages in the Lives and Adventures of Privates Terence Mulvaney, Stanley Ortheris and John Learoyd. Done into type and edited by Rudyard Kipling.

We be Soldiers Three
Pardonnez moy, je vous en prie.

Most of these tales are told in the inimitable language of the Irish member of the tri-partnership, Terence Mulvaney, whose humor, philosophy, strength and tenderness immediately endeared him to the reading public, and those stories in which the big Irishman plays the leading rôle, such the 'The Taking of Lungtungpen,' 'The Incarnation of Krishna Mulvaney' and 'The Courting of Dinah Shadd,' are unquestioned favorites; yet Mulvaney's associates, the little cockney, Ortheris, and the gigantic Welshman, Learoyd, are by no means to be slighted and much of the charm of the tales lies in the close friendship that binds the incongruous trio. In his 'Views and Reviews,' Henry James declares, "Mulvaney is a creation to be proud of and his two comrades stand as firm on their legs. In spite of Mulvaney's social possibilities, they are all three finished brutes; but it is precisely in the finish that we delight." And the *Edinburgh Review* says, "Mr. Kipling paints the real man, with his natural blackguardism, softened and redeemed by a rough chivalry, by unexpected gleams of tenderness and by a strong feeling of comradeship toward his brothers in arms." The revised editions, under the title 'Soldiers Three and Military Tales,' contain additional accounts of the adventures of the famous trio, together with other episodes relating to the British army in India, notably 'The Man Who Was' and 'The Drums of the Fore and Aft.'

ARTHUR GUTTERMAN.

SOLE, a European flatfish (*Solea vulgaris*), one of the most familiar of British food-fishes. The average length is about 12 inches and the weight about 18 ounces and the flesh is very palatable and nutritious. These fishes are usually captured by the trawl-net and sometimes by the line. They inhabit the shallow waters of sandy coasts and sometimes ascend rivers to spawn. Other species of soles are the lemon sole (*S. pegasus*), the variegated sole (*S. variegata*), which has a reddish-brown color marked with darker brown bands, and the solenette or little sole (*S. linguatulus*), the average length of which is about five inches. The transparent sole (*Achirus pellucidus*) of the Pacific Ocean, which wants the pectoral fins, and the zebra sole (*S. zebrina*) of Japan, are also well-known species. The nearest American representative is a small, closely allied fish, called hog-choker (*Achirus fasciatus*), common along the Eastern coast, but not regarded as worth eating.

SOLEMN LEAGUE AND COVENANT, The. A compact entered into in 1643 between England and Scotland for the "extirpation of popery and prelacy and the preservation of religious liberty" in the two countries. Two years later it was once more ratified in Scotland. Charles I refused his approval to the

League; but Charles II thought it the better part of discretion to yield to the pressure brought upon him by the Protestant faction, which had already shown itself all powerful; so he took a solemn oath to observe all the provisions of the international covenant, a compromise he had no intention of keeping, and he succeeded in having the Scottish Parliament, in 1661, annul the "Solemn League and Covenant" and absolve the lieges from their obligations to it. Consult Hetherington, 'History of Church of Scotland'; McCrie, 'Sketches of Church History.'

SOLENHOFEN. See SOLNHOFEN.

SOLENOID, a primary form of electrical magnet, consisting of a filament, which, when enclosed by a spiral-conducting wire properly positioned with its ends brought to the middle, may become a magnet when engaged by a current; also called solenoid magnet.

SOLENT, England, the western part of the strait of the English Channel separating the Isle of Wight from the mainland. It is 15 miles long and almost three miles wide and forms a safe roadstead. A few miles north of the Neches the navigable channel narrows to three-quarters of a mile. It has been the scene of many famous yacht races.

SOLEY, sô'li, James Russell, American naval historian: b. Roxbury, Mass., 1 Oct. 1850; d. New York, 11 Sept. 1911. He was graduated from Harvard in 1870 and in the following year was appointed professor in the Department of English at the United States Naval Academy at Annapolis. He was commissioned a commander in 1882 and stationed at Washington, D. C., in charge of the naval library there. From 1885 to 1889 he lectured upon naval history and international law in various Eastern colleges and in 1890 was appointed Assistant Secretary of the Navy. In 1893 he resigned this office and took up the practice of law in New York. He edited and conducted the publication of the naval history of the Civil War and is the author of 'The Campaigns of the Navy in the Civil War' (1883); 'The Naval Wars of the United States'; 'Maritime Industries of America,' etc.

SOLF, Wilhelm, German linguist, economist and statesman: b. Berlin, 5 Oct. 1862. After completing his gymnasium course, he attended the universities of Berlin and Kiel (where he studied Sanskrit and Comparative Philology), returning in 1887 to Berlin to pursue courses in Hindu, Urdu and Persian, at the Berlin Seminary for Oriental Languages, taking his Ph.D. degree in this field. He later took up the study of law at the University of Jena. He has seen much of the world, chiefly in the service of the German foreign office and colonial office in Calcutta and elsewhere. In 1900 he became governor of Samoa, and late in 1911 was made Secretary of State for the colonies (*Staatssekretär des Kolonialamts*). Under the Provisional German government which arose at Berlin after the signing of the armistice of 11 Nov. 1918, Solf became Minister for Foreign Affairs, an appointment which was strongly criticized by the more radical sections of the Socialist party by reason of the fact that it was wrong to retain any of the officials of the former German government un-

der the new "Socialistic" government. A Berlin message dated 26 Aug. 1919 announced the appointment of Dr. Solf as Ambassador of the German Republic to Great Britain. He is the author, in the philological field, of 'Die Kaçnür-Rezenzen der Pañcāgikā' (1886).

SOLFAING, söl-fā-īng (from sol, fa, in the musical scale), the exercising of the voice upon the syllables do, re, mi, fa, sol, la, si (solmization) used to designate the notes of the diatonic scale. Pieces without text intended for this sort of exercise are called *solfeggi*. Sometimes this word is applied also to instrumental music, referring to exercises, merely intended to improve the learner in reading notes and hitting intervals. See SOL-FA SYSTEM; SOLFEGGIO.

SOLFATARA, the Italian name for a kind of volcanic vent found in various parts of the earth, which, though not in a state of actual eruption, gives out sulphurous gases and vapors. The most notable are found in Italy, in the Antilles, in Mexico, in the interior of Asia and in Java. Probably the best known are those between Rome and Tivoli and that at Pozzuoli, near Naples. This last is an irregular plain almost surrounded by the walls of an ancient crater. From the crevices rise steam and gases, chiefly sulphuretted hydrogen, mixed with minute quantities of muriatic acid and muriate of ammonia. The cracks and fissures of the rocks abound with sulphur, alum and sulphate of iron. Solfataric action is an important source of commercial sulphur deposits.

SOLFEGGIO, söl-fěj'i-ō, in music, a vocal exercise, in which the syllables ut (or do), re, mi, fa, sol, la, si—corresponding to C, D, E, F, G, A, B—are used instead of words. Their use as a method of nomenclature originated, as far as the first six are concerned, in the 11th century with Guido Aretinus, who substituted his hexachord system for the old Greek tetrachords. Observing in the melody of an ancient hymn for the festival of Saint John the Baptist, beginning

*Ut queant laxis Rēonare fibrīs
Mīra gestorum Fāmuli tuorum
Solve polluti Labīi reatum
Sancte Iōannes,*

that the notes on which the successive phrases began were identical in order with the sounds of the hexachord, he adopted the syllables to which they were allied in the above stanza as names to represent the degrees of his new scale. When early in the 17th century, the octave was completed by the seventh or "leading note," the syllable Si, formed of the initials of "Sancte Iōannes," was added; while Do generally took the place of Ut, as being more easily sung. This illustration of the construction of the musical scale by the use of the syllables is called solmization.

SOLFERINO, söl-fě-rē'nō, Italy, in the province of Mantua and 18 miles northwest of the town of that name. From its commanding position of the Plain of Lombardy, its tower has acquired the title of "Spy of Italy." On 24 June 1859 the battle fought here between the Austrians on the one hand and the allied French and Sardinian troops, under Napoleon III, on the other, resulted in the defeat of the

former. In this bloody conflict the Austrians lost 20,000 men, their adversaries 18,000. The population of the village is about 1,500.

SOLICITOR. See ATTORNEY; BARRISTER.

SOLICITOR-GENERAL, (1) an officer of the British Crown, next in rank to the attorney-general, with whom he is in fact associated in the management of the legal business of the Crown and public offices. The solicitor-general of Scotland is one of the Crown-counsel, next in dignity and importance to the lord advocate. (2) In the United States, a Federal official subordinate to the Attorney-General, whose duty it is to fill the latter's place in his absence. He is an appointee of the President, handles the business of the United States government with the Supreme Court and State courts and receives \$10,000 annual salary.

SOLID, in geometry, a magnitude having three dimensions—length, breadth and thickness. A solid in physics is a body characterized by permanency of form; so much so, that the motion of one of its parts produces motion in the whole. As no materials have been proved absolutely permanent, adhering interminably to one form, there are no solids in the strictest sense; but the term is used of all things that normally retain their shape for a considerable time. We call cold butter solid, but it easily softens and melts. A ball of lead will flow under considerable pressure or with heat. A watch's mainspring is a solid, yet yields to a tiny force. When a solid piece of metal is strained beyond its limit of elasticity it fractures. The 13 geometrical forms of Archimedes, including the cube, octahedron, tetrahedron, dodecahedron, etc., are also technically termed solids. Hence a sphere, prism or other regular geometrical figure having magnitude is a solid. See ELASTICITY; LIQUID; MATTER.

SOLID-SHOT. See PROJECTILES.

SOLIDAGO. See GOLDEN-ROD.

SOLIDIFICATION, the passage of a substance into the solid state, either from a state of solution or fusion, or directly from the gaseous state. The term is usually applied, however, to the transition from the melted state into the solid form, and it is only in this sense that it will be here discussed. Some substances which are stable in the solid form cannot be melted without undergoing decomposition, either partial or complete; but many others can be converted into the liquid form by simple heating, passing back into the solid form again when the heat is abstracted. In general, fusion implies an addition of heat energy, and solidification implies its abstraction. Thus, to freeze one pound of water it is necessary to abstract from it an amount of heat energy that would be sufficient to raise the temperature of a pound of liquid water by about 140 degrees of the Fahrenheit scale; and in order to melt the pound of ice a precisely equal quantity of heat energy must be added to it again. All liquids may be divided into two general classes, whose laws of solidification are apparently very different. The first class includes bodies such as wax and glass, which, when they are cooled, pass into the solid state by a transition so gradual that it is impossible to assign any definite temperature at which the transformation can be considered to take place. The other class includes substances

which, like water, do not begin to solidify until they have been cooled to a certain definite temperature peculiar to each substance. Solidification then begins at once, and it progresses continually, as the heat is abstracted, the temperature of the mass remaining unchanged until all of the liquid has been transformed into the solid form. In some cases the solid body that is obtained is crystalline in structure, and in other cases it is amorphous. In general, the temperature of solidification of a substance is identical with the melting point of the same substance; but in some cases the molten condition persists until the mass has been cooled to a temperature materially lower than the temperature of fusion. The rare metal known as gallium, for example, melts at 86° F.; but when once melted it may be cooled to about 36° F. before it solidifies. This phenomenon—the persistence of the molten condition after the substance has been cooled below the normal melting point—is called surfusion, and it may be regarded as analogous to the supersaturation that is sometimes observed in solutions (q.v.). If a small fragment of solid gallium be added to the molten metal at a temperature below 86° F., solidification at once ensues; and in general it may be said that in any fluid substance in a state of surfusion solidification is at once induced by the addition of a fragment of the same substance in a solid form. Some substances increase in volume when they pass from the molten to the solid state and others decrease. For example, when water solidifies it increases in volume so that the bulk of the ice that is formed is about one-eleventh greater than that of the original water. Bismuth, bronze and a few other metals which give good sharp castings also maintain an increase in volume upon solidification. Lead, iron and most metals, on the other hand, decrease in volume when fusing from the liquid to the solid state.

Pressure has a marked influence upon the temperature of solidification; and Dr. James Thomson showed, from theoretical principles, that under great pressures the temperature of solidification is lowered in bodies which expand upon solidification, and raised in those in which solidification is accompanied by contraction; this theoretical prediction having been subsequently verified by direct experiment.

SOLIDUNGULA, or **PERISSODACTYLA**, a division of the mammalian order *Ungulata* (q.v.), represented by the horses, asses, zebras, etc., distinguished primarily by the fact that the feet have each a single well-developed toe only, encased in a broad "hoof."

SOLIDUS, a Roman coin originally called aureus (q.v.).

SOLINGEN, zō'ling-ën, Germany, in Prussia, in the Rhine province, stands on a hill bordering the Wupper River, 20 miles northeast of Cologne. It has Catholic and Protestant churches, a synagogue, schools of various grades, hospital, electricity and all the conveniences of a modern town. It is a centre of steel and iron industry in Germany. The municipality was established in 1374 and the town became famous for its sword-blades. There are numerous metal manufactories which turn out fine cutlery, copper and brass-ware, surgical instruments, etc., while several thousand workmen make small articles of cutlery at

home. There are besides paper, linen, cotton, silk, soap and other factories. Solingen cutlery has been famous since mediæval times and is supposed to have been introduced by crusaders from Damascus. Pop. 50,000.

SOLIS, Juan Diaz de, hoo-än' dē'äth, dā sō-lēs', Spanish navigator: b. probably at Lebrija, Spain, about 1470; d. 1516. In 1506 he accompanied the navigator Pinzon in his expedition in search of a western passage to India, and upon this voyage touched the shores of Central America and explored the Caribbean Sea as far south as Honduras. In 1508 they reached lat: 40° S. and explored the Bay of Rio de Janeiro. In 1515 he sailed from Spain in command of three vessels with the expectation of making further progress in his quest of the Eastern world, and upon this voyage discovered the Plata, which was originally named for him. He was killed by the Indians upon this voyage.

SOLIS Y RIBADENEIRA, sō-lēs' ē rē'-va-dā-nē'ē-ra, Antonio de, Spanish dramatist and historian: b. Alcala de Henares, 18 July 1610; d. 1686. Educated at the University of Salamanca, he there imbibed a strong love for literature and more especially for the stage; and already, at the age of 17, he had written a drama. At 22 he made a success with his play 'Gitanilla,' which is still frequently seen in revivals of the Spanish stage. From this time on he continued to produce dramas, most of which met with popular favor. His reputation gained for him the position of royal secretary. This brought him into close connection with the royal family and, in a sense, shaped his life, making him one of the favorite dramatic writers of the private court theatre, and consequently of the theatres of the capital. Solis was a master of intricate plot and characterization, and as such was deservedly popular in his day, and some of the best of his dramas are still played in Spain. His Spanish is excellent and free from the exaggerated style of his age and his versification is very harmonious. He wrote many dramas, but his greatest work and the one by which he will probably be longest remembered is his 'Conquest of Mexico,' which is one of the greatest histories ever written if it be judged from its literary and artistic excellence. Here his Spanish is almost perfect; his style rich, harmonious and beautiful and his handling of his subject is masterly. Yet his work has one great fault; he sees his whole story through the eyes of the Spanish adventurers and fails to comprehend that the exploited Aztecs had any rights, since Spain was Christian and they heathen. He is, therefore, out of sympathy with the great tragedy of his story, which is probably not strange when the age in which he lived is taken into consideration. Yet this one fault makes it fall short of being as really great a history as it is a literary work. The latter years of his life Solis, who never could successfully manage his pecuniary affairs and who was constantly in debt, retired to a monastery and ceased to write for the stage. Consult any good history of either Spanish or Mexican literature. A fair appreciation of his work is to be found in Ticknor's 'History of Spanish Literature' (New York 1854).

SOLITAIRE, söl-i-tär', (1) a flightless bird (*Pezophaps solitarius*), which has be-

come extinct within comparatively recent times. It inhabited the islands of Bourbon and Rodriguez until about 1760. It was related to the dodo (q.v.), and was described by Leguat, a French voyager, who dwelt in the islands in 1691, and who says that the males were of a "brown-gray color," the feet and beak being like a turkey's, but "more crooked." He notes that the tail was inconspicuous in size, the hinder parts being rounded; the neck was straight and the eye black and lively. "They never fly," says Leguat; "their wings are too little to support the weight of their bodies; they serve only to beat themselves and to flutter when they call one another." Some of the males were said to weigh 45 pounds. (2) In America a myadestive bird, the fly-catching thrush, so called because of its shy habits. They are common in the West Indies and the Rocky Mountains. Consult Newton, 'Dictionary of Birds' (New York 1896); Rothschild, W., 'Extinct Birds' (London 1907).

SOLITAIRE, a game played by one person on a board indented with 33 or 37 hemispherical hollows, with an equal number of balls. One ball is removed from the board and the empty hollow thus left enables pieces to be captured singly as in draughts. The object of the player is to take all the pieces except one without moving diagonally or over more than two spaces at a time. The name is also applied to several card-games played by one person. They depend usually upon a system of "building" upward in piles, a "marriage" or bringing together of king and queen freeing the lower cards of a pile for rebuilding. See CARDS.

SOLLY, Samuel Edwin, American physician: b. London, England, 5 May 1845. He studied medicine in London and practised there until 1874, at which time he came to America and settled in Colorado. He has published 'Handbook of Medical Climatology'; 'Tubercular Laryngitis'; 'The Influence of Altitude upon the Blood,' etc.

SOLMIZATION. See SOLFEGGIO.

SOLNHOFEN (zōln'hō-fēn) **BEDS** (SOLENHOFEN incorrectly), deposits of a peculiar character in the Jurassic strata of Bavaria and deriving their name from the town of Solenhofen, near which and Mönshelm, Eichstädt and Hofstetten in the valley of the Altmühl, they are obtained. They have acquired a world-wide use as lithographic stone. The rock varies from a nearly pure carbonate of lime (over 99 per cent) to one in which a moderate amount of silica is present. These latter portions are very thin-bedded, often appearing to have a slaty structure. All are exceedingly fine and uniform in grain, representing the deposits of an impalpable lime-flour or lime-mud in quiet though shallow lagoons surrounded by growing coral reefs. These fine lime-mud rocks (Calcilutites) are often rendered impure by the admixture of dust blown by the winds from the distant land and settling in the waters of the shallow lagoons. In these layers were imbedded dragon-flies and other insects, which were brought from the lands and whose remains, beautifully preserved, are found to-day in these thinner bedded and more impure layers, together with those of marine as well as other aerial animals. Most note-

worthy among these latter are the flying reptiles, Rhamphorhynchus and Pterodactylus, and the primitive bird Archaeopteryx, whose skeleton shows so many reptilian characters as to constitute this animal a veritable connecting link between reptiles and birds. See LITHOGRAPHY.

SOLOGUB, sōl ō-goob, **Feodor**, the nom-de-plume of Theodore Kuzmitch Teternikov, Russian poet, novelist and playwright: b. 1863. He was educated at the Teachers' Institute of Petrograd and for several years followed the profession of teaching. In 1894 his story, 'Shadows,' published in the *Severny Vestnik*, proved so popular that he turned to the career of a man of letters. Poems, novels, fables, plays and short stories flowed in rapid succession from his pen for over 12 years before he attained his first large measure of success in 1907 with the novel, 'The Little Demon.' His creative genius has found its best literary vehicle in the short story; as a stylist he has had few peers, but his scenes are usually laid in the unpromising milieu of the smaller provincial towns of Russia. His 'Sweet-Scented Name and Other Stories' has been published in English (1915).

SOLOMON: b. probably between 1033 and 993 B.C.; d. between 980 and 920 B.C.; the son of David, king of Israel, by Bathsheba, formerly the wife of Uriah, was appointed by David to be his successor in preference to his elder brothers. He ascended the throne between 12 and 14 years of age and reigned 40 years. His age is usually given as 53 at death. By his remarkable judicial decisions, and his completion of the political institutions of David, Solomon gained the respect and admiration of his people; while by the building of the temple, which gave the Hebrew worship a magnificence it had not hitherto possessed, he bound the nations still more strongly to his throne. He put to death Adonijah, Joab, Shimei and others whom he deemed enemies and married a daughter of Pharaoh besides women of nearly all the neighboring principalities to increase his influence and prestige. He built up a foreign commerce previously unknown. The wealth of Solomon, accumulated by a prudent use of the treasures inherited from his father; by successful commerce; by a careful administration of the royal revenues, and by an increase of taxes, — enabled him to meet the expense of erecting the temple, building palaces, cities and fortifications and of supporting the extravagance of a luxurious court. He extended his dominions from the Euphrates to the Philistine and Egyptian borders. He had a trading agreement with King Hiram of Tyre and received rare wood and other articles for the temple. Solomon chose influential men as his advisers, and himself attained a reputation of being one of the wisest of mankind. His fame was so great that the queen of Sheba traveled 1,500 miles to interview him. Many biblical and profane stories are told of his miraculous powers and prophetic ability. He knew better than to engage in war, but he maintained a considerable standing army, including 1,200 cavalry and 4,000 armed chariots.

Fortune long seemed to favor this great king, and Israel, in the fulness of its prosperity, scarcely perceived that he was continually be-

coming more despotic. Contrary to the laws of Moses, he admitted foreign women into his harem; and from love of them he was weak enough in his old age to permit the free practice of their idolatrous worship, and even to take part in it himself. Toward the close of his reign troubles arose in consequence of these delinquencies, and the growing discontent, coming to a head after his death, resulted in the division of the kingdom, which his feeble son Rehoboam could not prevent. The 40 years' reign of Solomon is still celebrated among the Jews for its splendor and its happy tranquillity, as one of the brightest periods of their history. The writings attributed to Solomon are the Book of Proverbs, Ecclesiastes and the Song of Solomon, with the apocryphal book the Wisdom of Solomon; but modern criticism has decided that only a portion of the Book of Proverbs can be referred to Solomon.

Students of Hebrew and Arabic works appear to agree that Solomon is much overrated by the biblical narrative, and that there was nothing in his career to deserve his being placed among the world's great men. Consult Alexander, 'King Solomon' (1897); Farrar, 'Solomon'; Hallock, 'Child's History of King Solomon'; Hirsh, E. G., 'Solomon' (in 'Jewish Encyclopedia,' New York 1907); Winterbotham, 'Life and Reign of Solomon.'

SOLOMON, Solomon Joseph, English painter: b. London, 16 Sept. 1860. He studied art at the Royal Academy schools, Munich Academy and the Ecole des Beaux Arts, Paris, and subsequently did much work during his travels in Italy, Spain and Morocco. Among his pictures are 'Cassandra' (1886); 'Sampson' (1887); 'Niobe' (1888); 'The Judgment of Paris' (1890); 'Echo and Narcissus' (1894); and many portraits.

SOLOMON, Odes of, a collection of 42 hymns by an unknown author, "Solomon" being a pseudonym. They were probably written toward the end of the 1st century, and possibly are the work of several writers. They are quoted in the gnostic book of the 3d century, 'Pistis Sophia' and in the 'Institutes' of Lactantius. They were discovered by Dr. J. Rendel Harris in 1908 in a 16th century Syriac manuscript in his possession, which contained also the 'Psalms of Solomon' (q.v.). The manuscript was made from the Greek and was mutilated so that the series begins with a fragment of the third ode. The first ode, however, has been restored from 'Pristis Sophia.' While they are undoubtedly of Christian origin they resemble the New Testament only slightly. Many of them are of Jewish atmosphere, which induced Harnack's theory that they were of Jewish origin and were revised early in the Christian era. Opinion generally admits them to be purely Christian, Harris placing most of them between 75 and 100 A.D. In the 'Pistis Sophia' they are assumed to be almost wholly derived from the canons of Scripture. Consult Harris, J. R., 'The Odes and Psalms of Solomon' (1909); Fleming, J., and Harnack, A., 'Ein Jüdischchristliches Psalmbuch' (1910); Conybeare, F. C., 'The Odes of Solomon Montanist' (1911).

SOLOMON, Psalms of, a collection of 18 hymns of Pharisee authorship and unwarrantably credited to Solomon. They were un-

doubtedly first written in Hebrew, but they are now extant only in Greek manuscripts and in a Syriac transcript from the Greek discovered by Dr. J. R. Harris in 1908. The period of their authorship is fixed at 70-40 B.C. Apparently they were written by two authors, the psalms dealing with the hopes for a Messiah being dissimilar in type to the others in which the Hasmoneans are charged with usurping the throne of David and unrightfully occupying the high-priesthood. The psalms are practically ignored by early Christian writers, but were in good standing in the Jewish Church and were used in the synagogues. Consult Ryle, E. H., and James, A., 'Psalms of the Pharisees, commonly called the Psalms of Solomon' (1891); Von Gebbart, O., 'Die Psalmon Salomos' (1895); Harris, J. R., 'Odes and Psalms of Solomon' (2d ed., 1911).

SOLOMON, Wisdom of. See WISDOM, BOOK OF.

SOLOMON ISLANDS, Melanesia, a group of islands in the Pacific Ocean, belonging to Great Britain and situated between lat. 5° and 11° S., and between long. 154° and 162° 30' E. It is an irregular chain stretching in a southeast direction from New Pomerania toward the New Hebrides, 1,000 miles off the northeast coast of Australia. The group consists of the large islands of Bougainville, Choiseul, Ysabal, Malaita, New Georgia, Guadalcanar and San Cristoval, arranged in two parallel rows and a large number of small islands. Bougainville, the largest, is 120 miles long and 35 miles wide and the other islands named above are but little smaller. The total area of the group is about 16,950 square miles. Bougainville, Buka and some contiguous islands were governed by Germany up to 1914, when they were captured by an Australian force. The islands are all elongated from northwest to southeast, and mountainous, rising in Bougainville to a height of 7,760 feet. There are two active volcanoes and numerous extinct craters and active hot springs. The surrounding waters are beset with coral reefs which make navigation dangerous. All the islands are heavily forested, and vegetation is very luxuriant. The inhabitants are Melanesians. They have had but little communication with Europeans and are still savages, practising cannibalism and polygamy. They cultivate the soil and are very skilful in boat-building and wood carving. Their number is estimated at 200,000, while the European population is less than 100, mostly missionaries. The chief products of the islands are copra, trepang, pearl, tortoise-shell and sandal wood. The islands were discovered by Mendaña in 1564. By the Anglo-German conventions of 1886 and 1899 the protectorate of the islands was divided so that Germany retained Bougainville and its neighboring islets, while the remaining islands came under the protection of Great Britain. By the Peace Treaty promulgated 28 June 1919 Germany was deprived of her portion of the islands, amounting in area to 4,200 square miles, which was placed under Australian administration. Consult Guppy, H. B., 'The Solomon Islands' (1887); Woodford, C. M., 'A Naturalist Among the Head Hunters' (London 1890).

SOLOMON'S SEAL, common liliaceous plants (*Polygonatum*) arising in copses from

thick, white, fleshy rootstocks. These bear circular scars left by each annual stem, upon its decay; by some, these are said to be the "seals," while others state that the name refers to the seal-like markings seen when the stem is cut across. The European *Polygonatum multiflorum*, and the American *P. biflorum* are much alike, and *P. commutatum* chiefly differs by being more glabrate and smaller. The Solomon's seals are now cultivated especially in wild gardens. They are apt to grow in colonies and have slender, tough stems, bending until nearly horizontal under the weight of the numerous, sessile, broadly lanceolate leaves, which are arranged closely, alternately and flatly on either side of the top of the stem. Under this protecting roof hang bell-like, three-parted flowers, generally in pairs on forked axillary peduncles. They are small, greenish in hue and succeeded by globose berries, very dark blue, with a bloom.

False Solomon's seals or wild spikenard (*Vagnera racemosa* and *V. stellata*) are similar liliaceous but less graceful plants. They do not have seals on the roots, are likely to be larger, with pubescent and longer leaves; and the starry white flowers are gathered in panicles or racemes at the end of the drooping stems. The berries are either red speckled with purple, or green striped with black. *V. racemosa* is sold by city florists in its season.

SOLON, sō'lōn, Athenian law-giver: b. Athens, about 640 B.C.; d. about 559. He was of a noble family and some of its members were ancestors of Codrus. Solon in early life became a trader, gathering by travel a fund of observation and experience, and thus became enrolled among the Seven Wise Men of Greece. His first appearance in public life was during the contest between Athens and Megara, for the possession of Salamis, a question he decided by quoting a passage of Homer in which Ajax is described as belonging to the Athenian armament. He appeared again as a promoter of hostilities against Cirrha in behalf of Delphi, and moved the Amphictyons to declare war. He was made archon about 592 or 594, at a time when the laws, too favorable to the rich, had overburdened the poorer classes to a critical point inviting revolution. His preliminary measures consisted of a "disburdening ordinance" intended to alleviate the burdens of the debtor class without doing injustice to the creditor; a rearrangement of the monetary system, and a measure to control the rate of interest and the acquisition of land. So successful did these reforms prove that he was charged with the remodeling of the constitution. He began by abolishing all the laws of Draco, except those relating to homicide, and established the right to citizenship on a basis of property qualification. He divided the people into four classes: (1) Pentacosiomedimni, those having a yearly income of at least 500 *medimni* (750 bushels) of corn, or *metretæ* of wine or oil; (2) Hippeis, Knights, those having 300 *medimni*; (3) Zeugitæ, those possessing a yoke of oxen with 150 *medimni*; (4) Thetes, workers for wages, those with less than 150 *medimni* as yearly income. The archons could only be chosen from the first class. Members of the first three classes were alone eligible for responsible offices and with them lay the

election to such offices. The Thetes were ineligible to office, but could vote in the general public assemblies. Solon among other things regulated the levying of taxes and the military service of the citizens. He also established the Council of the Four Hundred. His system tended to reduce debts and give greater opportunity to those in the lower classes; his code of laws regulated public and private life. He also reformed the calendar and the system of weights and measures. He regulated and reduced dowries, restricted prostitution, compelled fathers to teach trades to their sons and ordered that at stated periods each citizen must report how he earned his living. The laws he made were inscribed on wooden cylinders and triangular tables and set up in public. He acknowledged, however, that these laws were not the best conceivable, but the best that the Athenians could be made to accept.

The remainder of his history belongs to the borderland of legend. He is said to have exacted a pledge from the Athenians that they would not change his laws for 10 years and to have left the state for Egypt, Cyprus and Lydia. He returned to find the old dissensions renewed in a state which was destined in a short time to fall under the tyranny of Pisistratus. Consult Gilliard, 'Queues Reformes de Solon' (Paris 1907); Lehmann-Haupt, 'Solon of Athens' (Liverpool 1912). See **ATHENS**.

SOLOVIEV, sō-lō-vyēf, Vladimir Sergeievitch, Russian philosopher and religious writer: b. Moscow, 16 Jan. 1853; d. 31 July 1900. He was the son of the historian Sergei Soloviev and naturally grew up with the companionship of books. A born mystic, he in early youth passed through the stages of scepticism into a profound belief into a creed not clearly defined, but sufficient for himself. He was graduated from the University of Moscow in 1874 with a dissertation on 'The Crisis of Philosophy in Western Europe,' and shortly after visited France, Italy, England and Egypt. He was appointed to an associate professorship in the University of Saint Petersburg in 1877, which he held till 1881, when his plea for pardon on behalf of the assassin of Alexander II led to his dismissal and brought him into collision with the Holy Synod and its procurator, Pobiedonostseff. For the rest of his life Soloviev engaged in religious and philosophical writing, pouring out a vast variety of volumes with amazing fecundity. He acquired a deep knowledge of Hebrew and defended the Russian Jews against official persecution. Some of his works have long been translated and circulated in France and Germany, where they aroused considerable interest, but English readers have as yet been unable to learn much about a remarkable man who for a generation exerted a profound religious influence over his countrymen. His works hardly reveal a master philosophical thinker; his speculations rather leave the impression of being assimilated, taking over systems imported from the West and restating them in some extreme form, daring but not always original. At the age of 24 he wrote the 'Philosophical Principles of Integral Science'; the 'Critique of Exclusive Principle' and 'The Justification of Good' are obscure, fragmentary and discursive — displaying a disability of dissociating religion and morality from truth.

Like Newman, his spiritual pilgrimage led him to embrace the Roman Catholic Church, but there the resemblance ends. Newman was faced with the alternatives of blind belief or limitless unbelief; to Soloviev, belief was a necessity; convinced at the outset of the truth of Christianity, it only remained for him to choose the form. His admirers have referred to him as "the Russian Newman," "the Russian John the Baptist" and "the William James of Russia." None of these descriptions is accurate. Soloviev was not a dialectician; his conclusions do not conform to logical rule; he was truly Slavic in his spiritual mobility or instability; quickly receptive even of inconsistent doctrine, and aspiring after things that were hard or impossible to reconcile. The philosopher became absorbed in the religious teacher and reformer. He labored not only for a reunion between the Orthodox and the Roman Catholic churches, but for a general religious unity. His encyclopedic variety of literary productions and multifarious propaganda have recently begun to find their way into English; only his brilliant dialogue on 'War and Progress' and 'The Justification of the Good' (1919) have been translated. Consult d'Herbigny, M., 'Vladimir Soloviev' (London 1918).

SOLSTICE, in astronomy, either of the points in the ecliptic, midway between the equinoxes, at which the sun appears to stop or cease to recede from the equator, either north in summer or south in winter (considered from a northern hemisphere viewpoint). There are two solstices—the summer solstice, the first degree of Cancer, where the sun is about 21 June; and the winter solstice, the first degree of Capricorn, where the sun is about the 22 December. The time at which the sun is at either of these points also receives the same name.

SOLUTIONS. In chemistry and physics a solution is usually defined as a homogeneous liquid in which two or more chemically distinct substances are simultaneously present. Many authorities, however, restrict the term to such homogeneous liquid mixtures as exhibit a definite osmotic pressure (see below). Others extend it so as to make it include gaseous mixtures, and even solid mixtures such as alloys. In the present article we shall adopt the former course, using the term to signify a homogeneous liquid mixture, which is capable of exerting a definite osmotic pressure.

When a solid substance is dissolved in a liquid, the liquid is called the "solvent," and the solid is called the "solute." When a solution is prepared by mixing two liquids, either one of the liquids may be regarded as the "solvent," the other then being called the "solute"; but it is customary to consider the one which is present in largest amount as the "solvent." By way of illustrating these terms, let us suppose that approximately equal masses of water and of anhydrous liquid carbolic acid are shaken up together. The two will not mix freely at ordinary temperatures, but the water will take up a small quantity of the acid, and the acid will similarly take up a small quantity of the water; the mixture subsiding, when the agitation ceases, into two distinct layers, carbolic acid preponderating in the lower one, and water in the upper one. The upper layer may then be

regarded as a solution of carbolic acid in water, and the lower as a solution of water in carbolic acid; carbolic acid being the "solute" in the upper layer, and the "solvent" in the lower one. This distinction is evidently an arbitrary one, however, and many cases could be cited in which it would be impossible to assign any reason for regarding either constituent as the "solvent," in preference to the other one. For example, carbolic acid and water dissolve in each other more and more freely as the temperature rises, until, at temperatures above 183° F., they mix readily in all proportions. If equal masses of these substances were mixed at 185° F., therefore, we could regard either as the solvent, and either as the solute.

When a solid substance is dissolved in a liquid, it sometimes happens that there is no marked evidence of chemical change. In other cases, however, there is a very obvious chemical change. When ordinary cane sugar is dissolved in water, a syrupy liquid results, from which the sugar may be again obtained in the same chemical condition as at first, by allowing the water to evaporate at a sufficiently low temperature. If sodium hydroxide, on the other hand, is added to a given mass of hydrochloric acid until the acid is just neutralized, it is impossible to obtain either the acid or the sodium hydroxide by mere evaporation of the solution. Nothing but water passes away in the vapor, and the solid substance that remains behind when the water is all gone is found to be common salt. If we choose to do so, we may regard the mixture of sodium hydroxide and hydrochloric acid as a solution of the hydroxide in the acid; but since we may prepare identically the same ultimate mixture by adding common salt to pure water, it is perhaps more convenient to regard it as a solution of common salt in water. For the present we shall take the latter view, confining our attention solely to those cases of solution in which a solid dissolves in a liquid without any obvious chemical change.

When a solid is added to a liquid for which it has no chemical affinity, it may remain entirely unaffected. In this case, the solid is said to be "insoluble" in the liquid, and no solution is obtained. If the solid is not insoluble in the given liquid, it gradually disappears when the two are brought together, the part which ceases to be visible passing into the liquid in the dissolved state. In some cases the change is rapid and in others it is slow. It is always accelerated by agitating the solvent. Some solids appear to mix with certain solvents in all proportions; but in general it will be found that if the supply of the solid is sufficient there will come a time when, under the conditions of the experiment, no more of the solid will dissolve. The solution is then said to be "saturated." The quantity of a given solute that will dissolve in a given solvent depends upon several circumstances, but most notably upon the temperature of the solvent, nearly all substances being more soluble at high temperatures than at lower ones. If a saturated solution of a substance that is more soluble at high temperatures than at lower ones is warmed, it becomes capable of taking up more of the solute; and if such a saturated solution is cooled, it usually deposits some of the solute, until its degree of concentration becomes reduced to that corresponding to satura-

tion at the lower temperature. It is sometimes possible, however, to cause a solution to retain more of the dissolved solid than corresponds to saturation at a given temperature; though this "supersaturated" condition is quite unstable. Glauber's salt (that is, sulphate of sodium crystallized with 10 molecules of water), exhibits supersaturation in a marked manner. If a saturated solution of this salt be prepared at a certain definite temperature, and then removed from contact with any particle of the free, undissolved salt, its temperature may be lowered by a considerable amount before crystallization sets in. If the smallest fragment of the solid salt is placed in such a supersaturated solution, crystallization at once begins, proceeding rapidly until the concentration is reduced to that corresponding to normal saturation at the temperature at which the experiment is performed. Pressure appears to influence the solubility of a substance to a measurable extent, but the effect of a change of temperature is, in general, far more marked.

A solution which is far from being saturated, by reason of the solvent being present in great excess, is said to be "dilute." The physical phenomena manifested by dilute solutions are much more simple than those of solutions that are nearly saturated, in precisely the same way that the phenomena exhibited by an attenuated gas are simpler than those exhibited by the same gas in a strongly compressed state.

A solution which is not homogeneous throughout with respect to concentration, but which is dilute in some places and approximates to saturation in others, tends to become of uniform concentration throughout, by a process known as "diffusion." This consists in the gradual passage of the dissolved solid away from those regions in which the concentration is greatest and toward those in which it is least. This tendency was first discovered by Parrot, in 1815. It was experimentally investigated by Graham (1850), so far as concerns its manifestation in solutions whose internal motions are not restricted in any way; and Fick, in 1855, gave the fundamental mathematical theory of the process. In Fick's theory it was assumed that the quantity of dissolved salt which diffuses across a given sectional area of the solution in a given time is proportional to the rate of variation of the concentration of the solution per unit of length of the straight line that is perpendicular to the sectional area under consideration. This is entirely analogous to the assumption made by Fourier with regard to the conduction of heat through a solid; and, therefore, Fick was able to apply the results of Fourier's powerful analysis directly to the problem of diffusion in liquids. The subject being essentially mathematical in nature, reference must be made, for further particulars, to the works cited at the end of this article.

It was known in the 18th century that if a glass vessel is filled with alcohol and the opening is tightly covered with a bladder, and the whole is then immersed in water, the contents of the vessel increase so that the bladder is distended and sometimes bursts. This is evidently due to the fact that water enters the closed vessel by passing through the more or less porous bladder. In other words, it is a diffusion phenomenon, which takes place between two parts of a non-homogeneous fluid system,

which are separated from each other by means of a partially permeable partition. The systematic study of diffusion phenomena of this kind has led to many interesting and important results. Pfeffer (1877), by improving upon a suggestion due to Traube (1867), prepared diaphragms that were far superior to the bladders used by earlier experimenters; his method consisting in forming a precipitate of ferrocyanide of copper within the pores of a cell of porous earthenware. The earthenware, as thus prepared, was rendered "semi-permeable," inasmuch as it would allow of the passage of water through itself, while it would not permit of the passage of any dissolved substance that the water might contain. The porous cell, as thus prepared, was filled with a solution of some substance such as sugar or nitre, and was then carefully sealed up, save for one small opening to which a delicate mercury manometer was attached. The prepared cell being then immersed in a vessel of pure water, it was found that water will enter the cell, until the mercury manometer registers a very considerable pressure;—a pressure of three atmospheres being observed in the case of a $1\frac{1}{2}$ per cent solution of nitre. The passage of a liquid in this manner through a membrane or other porous septum is called osmosis (q.v.), and the maximum or limiting pressure that is attained when the system arrives at its ultimate condition of equilibrium is called the "osmotic pressure" of the solution. The osmotic pressure produced by any given solution is found to be proportional to the concentration of the solution, this relation being surprisingly accurate so long as the solution does not approach too closely to saturation. The osmotic pressure is further found to vary with the temperature of the solution; and the remarkable fact has been brought to light, partly by experiment and partly by theory, that for any given solution of constant concentration, the osmotic pressure is approximately proportional to the absolute temperature. De Vries has also shown that for non-electrolytes (such as solutions of sugar or glycerine in pure water), solutions of different substances possess the same osmotic pressures, provided their temperatures are the same, and they contain the same number of gram-molecules of dissolved substance per unit mass of the solvent. (A "gram-molecule" of any substance is a quantity such that its weight, in grams, is numerically equal to the molecular weight of the substance). It is evident, therefore, that the osmotic pressure of a dilute solution follows laws that are closely analogous to those that hold true for attenuated gases. Much of the modern theory of solutions has been built up on this fact; and while some of the reasoning by which students of physical chemistry draw upon the known facts of gaseous thermodynamics for information concerning solutions appears to be more or less imperfect, it must be admitted that the known analogies between attenuated gases and dilute, non-electrolytic solutions are highly interesting and suggestive.

Blagden, in 1788, showed that the freezing point of a salt solution is lower than that of pure water by an amount which is nearly proportional to the concentration of the solution, so long as the solution does not approach too nearly to saturation. Other investigators have

examined this subject from time to time, and especially Raoult (1882), who worked with many different solutes, and with several solvents. Raoult's general conclusion was, that in any given solvent the freezing point is lowered by the same amount, by the presence of one gram-molecule of any dissolved substance whatever. This law is somewhat too general, as it has exceptions which cannot be here discussed; but it is sufficiently general and sufficiently accurate to be of material service in the determination of the molecular weights of substances whose percentage compositions are known by other methods. Raoult found also that the boiling point of a solvent is raised by the presence of a dissolved substance, the elevation being here also proportional to the concentration of the solution, and being, for any one solvent, independent of the nature of the solute, so long as the same number of gram-molecules of the solute are present in every case. This law is also subject to exceptions; but, like the freezing point law, it is very useful. In the determination of molecular weights by either of these methods, it must be remembered that the molecular weight of a substance may be (and indeed often is) different when the substance is considered in different physical states. Beckmann, for example, found that the boiling point of carbon disulphide is raised by sulphur by an amount which indicates that the molecule of sulphur contains eight atoms, when that element is dissolved in carbon disulphide; previous experiments on the vapor density of sulphur indicating that in the vaporous condition its molecule contains six atoms.

In a general way, the ultimate nature of the process of solution is explained by the molecular theory of matter (see MOLECULAR THEORY); but the molecular theory still leaves much to be desired on this score. We are to think of the solid solute as composed of a system of molecules, held together by the inter-molecular attractive forces that cause the parts of solids to cohere to one another. When the solute is placed in the solvent, the external attractive force of the solvent upon the superficial molecular layers of the solute partially neutralizes the internal forces by which these molecules are held in position, and more or less of the molecules of the solid escape into the solvent. As the concentration of the solution increases, an increasing number of the dissolved molecules will again come within the range of attraction of the undissolved portion of the solute, in such a way as to be caught by the solute, and temporarily retained as a part of it. Saturation occurs when the number of molecules regained by the solute in this way in any given time becomes equal to the number lost by it in the same time. Saturation being thus determined by the equality of the molecular exchanges that take place in a given time at the surface of the undissolved solute, it is evident that when no free solid is present there can be no such equality of exchanges. Hence the possibility of a "supersaturated" solution. Indefinite supersaturation cannot be experimentally realized, however, for in the ceaseless rearrangement of molecules that takes place in a liquid, it occasionally happens that a certain number of molecules of the dissolved substance fortuitously come together in such a way as to serve as a nucleus for the deposition of the solid; and

when this occurs, the supersaturated solution spontaneously deposits the excess of solute that it contains.

The molecular condition of the dissolved portion of the solute has been made the subject of much study. When a solute dissolves, its dissolution is almost invariably accompanied by thermal changes, the solution becoming either cooled or heated. By reason of these thermal changes, the phenomena of solutions may be discussed by the aid of the general laws of thermodynamics (q.v.), without making any special hypotheses as to the ultimate molecular nature of the solution. This plan was carried out with great power by Gibbs, in his celebrated paper entitled 'On the Equilibrium of Heterogeneous Substances' (Transactions of the Connecticut Academy of Sciences, October 1875). His paper is so exceedingly general, and so entirely mathematical, that it is very difficult to read; and hence his methods are not understood, even yet, as widely as they should be. Van't Hoff and Arrhenius, attracted more to the purely physical side of the question, and desiring to form (if possible) some sort of a mental image of the actual processes that are going on, have developed a theory regarding the nature of the dissolved solute, which is known as the "ionic theory," or as the "electrolytic dissociation theory"; and it is this theory which is most widely accepted at the present time. It has at least the merit of being suggestive, as well as fruitful in its practical results. There is also a so-called "hydrate theory" of solutions, in which the solute, in aqueous solutions, is supposed to form a series of definite hydrates with the solvent; analogous compounds being also formed in non-aqueous solutions. This theory has had many distinguished supporters, among whom the great Russian chemist Mendeléeff may be specially mentioned. In recent years its most devoted apostle is perhaps S. U. Pickering, who has defended it with ingenuity and power. The literature of the hydrate theory is not extensive, however, when compared with that of the ionic theory; and the ionic theory has the decided preference among physical chemists at the present time. A general presentation of the hydrate theory, written by Mr. Pickering, will be found in Watts' 'Dictionary of Chemistry,' article "Solutions II."

According to the ionic theory of Van't Hoff and Arrhenius, the solute, in a solution, is dissociated more or less completely into little bodies called "ions"; the dissociation being slight or even zero in some cases, and very extensive in others. In a solution (such as that of sugar in water) which does not conduct electricity electrolytically, there is little or no "ionization," or dissociation of the solute molecules into ions; while in a salt solution, which does conduct electrolytically, the dissociation is large, and may even be almost complete, when the solution is very dilute. The ions are not necessarily identical with the atoms, although they may be so in certain cases. When sulphuric acid and water compose the solution, the sulphuric acid is supposed to be partially dissociated into hydrogen and "sulphion" (SO_2); sulphion being a hypothetical "ion," supposed to be present in the solution, but being admittedly incapable of existence in the free state. In the same way, sodium chloride, NaCl , when dissolved, is supposed to be more or less com-

pletely dissociated into the ions Na and Cl. It will be observed, however, that the ions are here *atoms* of sodium and chlorine, and not *molecules*; the molecules of these substances having the respective formulæ Na_2 and Cl_2 , and being, therefore, composed, in each case, of two ions joined together. Here, as in the case of sulphur, the ions are seen to be incapable of free existence; because when the sodium and the chlorine are set free, by electrolysis or otherwise, it is a *molecular* aggregate that is obtained, and not a collection of the free ions. The completeness of the ionization of a solute is affected by various circumstances, but most notably by the degree of concentration of the solution; and the proportion of the solute molecules that are dissociated in any given solution may be numerically determined by various methods, for which the special works on solutions must be consulted. It is important to observe that ions are entirely different things from "electrons," the electrons being the ultimate particles of which the atoms are supposed to be built up, while the ions are either the atoms themselves, or else larger systems composed of the atoms. (See ELECTRON THEORY). The dissociated ions in a solution are supposed to be endowed with electric charges, the two ions into which any given molecule is separated being charged oppositely. In the case of sodium chloride, for example, the sodium ion is charged positively and the chlorine ion negatively. Upon the evaporation of the solvent, these ions recombine, their electric charges then neutralizing each other, so that the molecule, as a whole, is not electrified. There is no immediate evidence, in a solution, of the existence, within it, of electrified particles, or "ions"; but if an electrical stress is excited across the solution, by inserting the electrodes of a galvanic battery at opposite sides of the containing vessel, the positively electrified ions are urged one way, and the negatively electrified ones the other way. Eventually the ions, thus urged along, come in contact with the electrodes themselves, and here the ions discharge their electricities, becoming thereby capable of existing in the free state again, and being, in fact, deposited upon the electrodes, unless prevented by some secondary action within the cell. It will be observed that electrical conduction through an electrolyte is entirely different (according to the ionic theory) from conduction through solid conductors like metallic wires. The ions in a solution transport their charges bodily and pour them out upon the electrodes. The charge of an ion is supposed to be perfectly definite in magnitude; and hence Faraday's law, that electrolytic decomposition is accurately proportional to the total quantity of electricity passing through the electrolyte, is easily understood. It might be even better to state it in the inverse form; namely, that the quantity of electricity conveyed across an electrolytic solution, under a given electric stress, is accurately proportional to the total quantity of matter set free upon the electrodes. In a solution which does not conduct electricity, the reason that it does not conduct is supposed to be, that the molecules of the solute are not dissociated into ions to any important extent, so that they are incapable of being electrically charged, and are, therefore, incapable of acting as conveyors of electricity.

A single example may be given of the appli-

cation of the molecular theory of solutions to the explanation of chemical equilibrium and mass action. Suppose that m gram-molecules of ethyl alcohol, one gram-molecule of acetic acid and n gram-molecules of water are mixed and the solution is allowed to stand indefinitely. The acetic acid $\text{H.C}_2\text{H}_3\text{O}_2$, combines with the alcohol, $\text{C}_2\text{H}_5\text{OH}$, to form ethyl acetate, $\text{C}_2\text{H}_5\text{C}_2\text{H}_3\text{O}_2$, and water, H_2O , in accordance with the equation: $\text{H.C}_2\text{H}_3\text{O}_2 + \text{C}_2\text{H}_5\text{OH} = \text{C}_2\text{H}_5\text{C}_2\text{H}_3\text{O}_2 + \text{H}_2\text{O}$. But the reaction proceeds very slowly, so that several days elapse before a state of approximate equilibrium is attained; and even then the solution will contain free acetic acid and free alcohol, the amounts of these that remain uncombined depending upon the relative quantities of the several constituents that were present in the original solution; — that is, upon m and n . (It is this dependence upon the relative quantities of the reacting substances that is understood when we speak of the "effect of mass" in chemical reactions; or, more briefly, of "mass action"). Suppose, now, that after a certain time, there have been x gram-molecules of ethyl acetate formed in the course of the reaction. This implies that there have also been x gram-molecules of water formed at the same time, and x gram-molecules, each, of acetic acid and of alcohol destroyed. At the instant contemplated, the number of gram-molecules of each of the several substances present in the solution will, therefore, be as follows: Of alcohol, $(m-x)$; of acetic acid, $(1-x)$; of ethyl acetate, x ; and of water, $(n+x)$. The number of actual molecules of alcohol and of acetic acid present in the solution at this time will, therefore, be proportional to $(m-x)$ and to $(1-x)$, respectively; and hence the number of chance encounters, during one second, between a molecule of acetic acid and one of alcohol will be proportional to the product of these quantities, or to $(m-x)(1-x)$. We may assume that the number of actual combinations taking place under these circumstances will be proportional to this number of encounters, and to a certain (as yet unknown) coefficient of "affinity" between the two substances, which coefficient we will denote by k . The total number of gram-molecules of ethyl acetate formed during the next following second may, therefore, be taken as $k(m-x)(1-x)$. Now if we had started our experiment by mixing ethyl acetate with pure water, we should have found that the water and the ethyl acetate would combine to form alcohol and free acetic acid, as indicated by reading the foregoing chemical equation from right to left; the reaction, in that case also, proceeding only to a definite point, and then ceasing. In the actual case we must conceive of both of these reactions as going on simultaneously. There being x gram-molecules of ethyl acetate present at the proposed instant, and $(n+x)$ gram-molecules of water, and the "chemical affinity" of water for ethyl acetate being supposed to be measured by a new coefficient, k' , we conclude, by a process of reasoning entirely analogous to that just explained, that in the next following second the number of gram-molecules of ethyl acetate that will be decomposed will be $k'(n+x)x$. When equilibrium is finally established, so that ethyl acetate is no longer formed or decomposed (that is, when it is formed and decomposed with equal rapidity),

we have the equation $k(m-x)(1-x) = k'(n+x)x$. By trying the experiment with known initial quantities of acetic acid, alcohol and water, we could ascertain, directly, the value of x , which now represents the number of gram-molecules of ethyl acetate present when equilibrium is attained; and substitution in the foregoing equation would then give us the ratio of k to k' ,—that is, it would give us the ratio of the actual chemical affinities that are involved in this reaction. It has been found, in this way, that if we make (initially) $m=1$ and $n=0$, then when equilibrium is attained, the resulting value of x is $\frac{2}{3}$. Substituting this for x , and putting 1 for m and 0 for n , we easily find that $k/k'=4$. With this value of the ratio of k to k' , we may write the foregoing equation in the form $3x^2 - (4+4m+n)x + 4m = 0$. This is a quadratic equation, and in order to find the final state of equilibrium for any proportion of alcohol and water to acetic acid in the original solution, we have merely to substitute for m and n their values as given for the primitive solution, and then solve for x . The equation, being a quadratic, has two roots; but no trouble need be had on that account, since it is plain that we must accept that root which would give $x=0$ when we set $m=0$. The results obtained from this equation by calculation have been compared with the direct results of experiment, and the agreement has been found to be quite satisfactory. Many other similar problems have also been worked out from theoretical principles and the results verified by direct observation, and by the introduction of the methods of the differential and integral calculus it has even been found to be possible to follow the course of such reactions from stage to stage, so that the composition of the solution can be known at every instant, and not merely for the state of final equilibrium.

ALLAN D. RISTEEN.

SOLVAY, Ernest, Belgian manufacturer: b. Rabeck, near Brussels, 16 April 1838. He was educated at Liège and early engaged in the manufacture of chemicals. He developed the ammonia process for manufacturing soda, established it commercially, and after first manufacturing at Couillet, Belgium, which plant he established in 1863, he extended the industry throughout Europe and America. By 1913 he owned a practical monopoly of the production of the world's supply of soda. He has given liberally of his great fortune to educational and charitable purposes and while suffering material losses through the European War greatly assisted his countrymen during the German invasion. He served in the Belgian Senate in 1893-1900; founded the Ecole de Commerce and the Ecole des Sciences Politiques et Sociales, as well as international institutes of chemistry and sociology, and is president of the Bureau of the International Institute of Bibliography at Brussels. He is a grand officer of the Order of Leopold, honorary member of the Royal Institute of Great Britain and was

awarded the Lavoisier medal of the Institute of France and the grand medal of the University of Paris.

SOLWAY FIRTH, söl'wā fērth, Great Britain, an arm of the Irish Sea separating the county of Cumberland, England, from the southwestern part of Scotland. It extends nearly 40 miles inland, narrowing gradually from a breadth of 20 miles. Its upper part forms the estuary of the Esk. Large areas are left dry at low tide, while the high tide rushes in as a violent bore.

SOLYMAN I, El Kanouni (THE MAGNIFICENT), emperor of Turkey, son of Selim I: b. 1493; d. Szigeth, Hungary, 1566. He succeeded his father in 1520, crushed a rebellion in Syria in 1521, concluded a treaty of peace with Venice and then inaugurated the first of a long series of wars against Europe. He captured Belgrade in 1521, Rhodes in 1522, defeated the Hungarians with fearful loss at Mohács in 1526 and mastered Buda in 1529. He then laid siege to Vienna, but met with disastrous defeat. He took Bagdad in 1534, and on condition of an enormous yearly tribute concluded a peace with Venice in 1539 and with Austria in 1547. He made successful war against Kurdistan, conquered Van and Tebriz and part of Georgia in 1548, but in the next year met with continued losses at the hands of Austria, and in 1552 he was defeated with enormous loss in the siege of Erlau. His wars with Persia in 1554-55 were disastrous as were also his Hungarian wars of 1558. He attempted to break Spain's naval power, but met with defeat at Malta in 1565, though he took the Isle of Chios in 1566. He was engaged in a war with Austria when he fell at the siege of Szigeth. His reign saw the zenith and the decline of Ottoman power. He remodeled the code of laws, introduced reforms in the judiciary and in taxation and erected mosques and public buildings which are marvels of Ottoman architecture. He was also a poet and a patron of literature and art. In addition to his own superior abilities he was aided by statesmen, generals and naval commanders of unquestionable greatness. His successes came principally in the early years of his reign and though he left his empire with greatly extended boundaries it had been much weakened by his long continued wars.

SOLYMAN II, Turkish emperor, son of Sultan Ibrahim: b. 1642; d. Constantinople, Turkey, 1691. He succeeded to the throne on the disposition of his brother, Mahomet IV, in 1687. His life had been spent in the seraglio in the study of the Koran and feeling his incapacity to reign he entrusted the administration of the government principally to his grand vizier, Kupruli Zadek Mustapha Pasha, the Virtuous. His reign saw the defeat of Turkish arms in Hungary and in Serbia, the grand vizier meeting death at the disastrous defeat of Selankemen two months after the death of his master.

SOMA, a sacred plant of India and an intoxicating drink prepared from it, the latter being a libation of great importance in the ancient religion of India. The draught is not only an offering to Indra, but in the form haoma is poured upon the ground, at the beginning of a meal, or at the reception of guests, as a drink-offering to the earth. Soma is also a lunar di-

vinity, allied to Indra, the plant having been deified before the separation of the Indo-Iranians, on account of its moon-like swelling and color and because of the maddening effects of its juice. It is, moreover, identified with the Hindus' mythical tree of life that grew in paradise, the juice of which imparted immortality and which was guarded by spirits. The Rig-Veda refers to this in a hymn:

"We've quaffed the soma bright
And are immortal grown
We've entered into light,
And all the gods have known."

According to John Fiske, the soma is a plant, connected mythically with lightning. Although several plants have been called soma, it is generally supposed that *Sarcostemma brevistigma* is the plant indicated. It is a climbing plant, also called moon-plant, of the milk-weed family, with slender jointed stems and succulent pendulous branches, terminated by small umbel-like cymes of whitish fragrant blossoms. It has a milky juice. Soma is picked by moonlight, taken to a place of sacrifice and crushed between stones; the juice is then strained and allowed to ferment. It is then offered to the gods and afterward drunk by the priests.

SOMALILAND, sō-mā'lē-lānd, Africa, a general name applied to the coast region to the southeast of Abyssinia and bordering on the Gulf of Aden and the Indian Ocean as far south as the equator. The region is divided between France, Great Britain and Italy. See FRENCH SOMALILAND; ITALIAN SOMALILAND; BRITISH EMPIRE.

SOMALILAND PROTECTORATE, a territory on the west coast of Africa under the protection of Great Britain, lying along the Gulf of Aden from about long. 43° to 49° E., and extending from about lat. 11° to 8° N. On the east and southeast it is bounded by Italian Somaliland, on the south and west by Abyssinia and on the northwest by French Somaliland. It has an area estimated at nearly 70,000 square miles, lacking in fertility largely on account of a need of natural irrigation. The surface is in great part mountainous. The climate is more healthful in the interior than along the coast where there is more humidity. Among the chief products are sheep, cattle, skins, ostrich feathers, myrrh and incense. The principal ports are Bulhar, Zeila and Berbera, connected by telegraph lines and having wireless telegraph stations. Berbera, the capital, pop. 30,000, has a good harbor and is in winter the scene of considerable commercial activity. The combined imports and exports are valued at about \$2,500,000. The protectorate, created in 1884, is administered by a commissioner and commander-in-chief appointed by the colonial office since 1 April 1905. In 1894 the boundary between this protectorate and Italian Somaliland was defined. In the spring of 1903 an agitation in this region in favor of the Mad Mullah (q.v.) led to a considerable loss among the British troops and their concentration on the coast. Since 1912 a camel constabulary corps has been effective in checking intertribal fighting. The inhabitants are related to the Abyssinians and Gallas and on account of their nomadic habits there are no accurate statistics of population, which is estimated at about 300,000. Consult Drake-Brockman, R. E.,

'British Somaliland' (London 1912); Hamilton, A., 'Somaliland' (London 1911); Swayne, H. G. C., 'Seventeen Trips through Somaliland' (London 1900).

SOMBRETERE, sōm-brā-rā'tē, Mexico, in the state of Zacatecas, 65 miles northwest of the town of that name, in a mountainous district (2,570 metres), rich in silver. Its mines are said to have once contained the richest veins ever known, but are now nearly exhausted. Pop. 11,954.

SOMBRERO (sōm-brā'rō) **ISLAND**, West Indies, a small rocky island of the Leeward Group, about midway between the Virgin Group and Anguilla, resembling in form the Mexican hat or sombrero, whence the name. Its staple products are sugar and molasses, besides pineapples and cocoa. It exported formerly large quantities of phosphate of lime, the deposits of which have been exhausted. Administratively it is attached to the Virgin Islands. The Board of Trade supports a lighthouse on the island.

SOMERS, Sir George, English navigator: b. Lyme Regis, Dorset, 1554; d. Bermuda Islands, 9 Nov. 1611. He took part in a number of voyages, notably in those of Sir Walter Raleigh, upon the Spanish seas, and in 1606 entered into organization of the London or South-Virginia Company for the colonization of the western continent and was afterward created admiral of the fleet bound for Virginia which sailed from Plymouth, 2 June 1609. His ship, the *Sea Venture*, was separated from the rest of the fleet by a hurricane when half way across the Atlantic, and on 25 July landed at the Bermuda Islands, which were immediately claimed by him as English possessions and named Virgineola and later the Somers Islands. They were afterward colonized from Virginia. Consult Neill, E. D., 'Virginia Company of London' (Albany, N. Y., 1869); Doyle, J. A., 'English Colonies in America' (New York 1882-1907); Lefroy, 'History of the Bermudaes or Summer Islands' (Hakluyt Society 1882).

SOMERS, John, LORD, English statesman: b. Worcester, 4 March 1652; d. London, 26 April 1716. He was graduated from Oxford and admitted to the bar in 1676. As a prominent member of the Whig or Country party he was active in the political life of the revolutionary period. He was chairman of the committee which drafted the Bill of Rights and was the defender of that bill in Parliament. He was engaged as counsel for the Seven Bishops in 1688 and occupied a number of important offices during the reigns of James II and William III, being Solicitor-General (1689); Attorney-General (1692); Lord Keeper (1693) and speaker of the House of Lords in the same year. In 1697 he became Lord Chancellor of England and was raised to the peerage. Papers for his impeachment were begun in 1700, when he was removed from the chancellorship. His valuable papers were collected and edited by Sir Walter Scott in 1809-15. Consult Maddock, Henry, 'An Account of the Life and Writings of Lord Chancellor Somers' (London 1812).

SOMERS, Richard, American naval officer: b. Egg Harbor, N. J., 1778; d. 4 Sept. 1804. He

entered the navy in 1798 and was assigned to the frigate *United States*. In the war with Tripoli he was placed in command of the *Nautilus* and for gallant service rendered in that campaign was made commander. He was killed in a heroic attempt to destroy the Turkish fleet by blowing up his own ship, the *Intrepid*, in its midst.

SOMERS ISLANDS. See BERMUDA ISLANDS.

SOMERSET, Lady Henry (Isabel), English temperance reformer, daughter of the Earl of Somers: b. 1850. She was married to Lord Henry Somerset in 1873; is actively interested in various industrial institutions and local missions; founded the industrial farm colony for inebriate women at Duxhurst, Surrey, and established and conducted for 15 years a home for training workhouse children and a home for children from the Society for the Prevention of Cruelty to Children. She is president of the National British Women's Temperance Association and in 1889 was elected president of the World's Women's Christian Temperance Union. She is editor of the *Women's Signal* and has written 'Studies in Black and White'; 'Our Village Life' and 'Beauty and Ashes,' a book on reform for women. She has frequently visited and lectured in the United States.

SOMERSET, Ky., city and county-seat of Pulaski County, 68 miles south of Lexington, on the Cincinnati, New Orleans and Texas Pacific Railroad. There are railroad shops and manufactures of knit goods, lumber, spokes and staves. Pop. 4,491.

SOMERSET, Mass., town and village in Bristol County, on the Taunton River, 42 miles south of Boston, and on the New York, New Haven and Hartford Railroad. It has iron works and a stove manufacturing industry. Pop. 3,377.

SOMERSET (Ky.), Engagement at. In March 1863, Gen. John Pegram, with 1,550 cavalry and three guns, started from East Tennessee on an expedition into eastern Kentucky to seize beef cattle for the Confederate army. On 22 March he crossed to the north bank of the Cumberland River, by Stigall's Ferry, and making a forced march reached and attacked Danville, on the 24th, driving out Wolford's Union cavalry and pursuing them nearly to the Kentucky River. He then began to collect his cattle in the counties of Lincoln, Boyle and Garrard. On the 26th General Burnside ordered Generals Gillmore and Manson, who were north of the Kentucky River, to concentrate their forces and attack Pegram, then in the vicinity of Danville. Gillmore crossed the Kentucky River at Hickman's bridge on the 28th and drove Pegram across Dick's River, Pegram burning the bridges to check pursuit. On the same day Manson occupied Danville and moved to co-operate with Gillmore, who was following Pegram toward the Cumberland. Pegram had called in and concentrated his command, and falling back skirmishing, made a stand in a strong position on Dutton's Hill, three miles north of Somerset, in order to check the Union pursuit until he could get all his captured cattle across the river, six miles in his rear. Gillmore, with 1,250 mounted

men and six guns, advanced on Pegram's position at daybreak of the 30th and drove his rear-guard back upon his main line, which he found strongly posted and resisting firmly. An effort by Pegram to turn Gillmore's right failed and Gillmore, dismounting his men and forming in line, the action began at noon by artillery firing on both sides, which was continued two hours, when Gillmore's men charged to within 30 yards of the Confederate line and it gave way from right to left and could not be rallied until near the town, when order was restored and another position taken and slight works thrown up, about three miles south of Somerset. As night was setting in, no attack was made on this position, Gillmore contenting himself with throwing a few shells and advancing his skirmishers. During the night Pegram recrossed the Cumberland at Stigall's Ferry with 537 of the 750 cattle he had collected. The Union loss in the engagement was about 30 killed and wounded. Pegram reports a loss during his raid of over 200 men. Consult 'Official Records' (Vol. XXIII).

SOMERSWORTH, N. H., city in Strafford County, on Salmon Falls River, 18 miles northwest of Manchester, on the Boston and Maine Railroad. There are manufactures of cotton goods, yarns, boots, shoes and boxes and also bleaching and dye works. The place was settled in 1729. Pop. 6,704.

SOMERVILLE, Alexander, Canadian journalist: b. Springfield, East Lothian, Scotland, 15 March 1811; d. Toronto, Canada, 17 June 1885. He enlisted in the Scots Grays at Birmingham on the eve of the Reform riots of 1832. He protested against the orders to the soldiers to rough sharpen their swords in expectations of a conflict with the rioters, and later, on another pretext, but in his opinion because of his former action, he was given 100 lashes. He obtained an inquiry, the principals in the affair were reprimanded and a Parliamentary discussion of army discipline followed with the result of a modification of certain harsh practices in the army. He served with the British Legion in Spain in 1835 and in 1837 he resigned from the army. In 1839 he was asked to lead an insurrection in Wales, but instead he set to work to prevent it. He was later engaged in journalism and in 1858 he removed to Canada, where he was for a time editor of the *Canadian Illustrated News* and he was a contributor to the *Spectator* and other periodicals. He died in extreme poverty, refusing to the last the assistance of his friends. Author of 'Autobiography of a Workingman' (1848); 'Financial Reform Catechism' (1849); 'The Conservation Science of Nations,' containing an account of his army experience (1860); 'A Narrative of the Fenian Invasion of Canada' (1860), etc.

SOMERVILLE, Mary Fairfax, English mathematician: b. Jedburgh, Scotland, 26 Dec. 1780; d. Naples, Italy, 29 Nov. 1872. She was the daughter of Admiral Fairfax and in 1804 was married to Samuel Grey (d. 1807). It was not, however, until after her 30th year and her marriage to her cousin, William Somerville, that she began to publish the results of her studies. In 1827 she began the translation of Laplace's 'Mécanique Céleste' and four

years later popularized in England the great work of the astronomer under the title, 'The Mechanism of the Heavens' (1831). The book was immediately adopted by the English universities and brought her prominently before the scientific world. Her fame, however, did not rest upon this great undertaking alone. In 1834 she published 'The Connection of the Physical Sciences,' a work which was also widely read and in 1848 a treatise upon physical geography. The latter half of her life was spent in Italy, where she lived with her children after the death of her husband and where her efforts were devoted to the revision of her earlier books and the writing of her 'Molecular and Microscopic Sciences' (1869). The story of her life contained in an autobiographical account entitled 'Personal Recollections of Mary Somerville,' compiled and edited by her daughter, is a valuable history of her long and useful career.

SOMERVILLE, William, English poet: b. Edstone, Warwickshire, 1677; d. 19 July 1742. His most celebrated poem, 'The Chase,' an epic, written in blank verse and published in two volumes in 1734, made a place for him among the 18th century poets. He wrote also a burlesque of rural games entitled 'Hobbinol' (1740) and 'Field Sports' (1742). His poems with a biography are in the collections of Johnson and Chambers; a collective edition of his works appearing in 1801. 'The Chase' has been edited separately by G. Gilfillan (Edinburgh 1859).

SOMERVILLE, Mass., city in Middlesex County, on the Mystic River and on the Fitchburg and the Boston and Maine railroads. The Mystic separates the city from Chelsea on the east, Boston is on the southeast boundary and Cambridge on the southwest and west. Several steam railroads and electric lines connect the city with Boston, Cambridge, Chelsea, Newton and all the nearby towns and cities. It is largely a residential suburb of Boston and has many fine private and public dwellings. Somerville was settled in 1629 and was a part of Charleston until 1842 when it was set off as an independent town. In 1872 it was incorporated as a city. It is built on seven hills, all of which exist, although street grading has lowered some of them. In 1631 the first vessel built in Massachusetts was launched from Governor Winthrop's "Ten Hill" farm on the Mystic. On Quarry Hill, in the centre of one of the public parks, is an old building, once a powder-house, which was built in 1703. During the Revolutionary period several fortifications were built on the hills of Somerville. On Cobble Hill was General Putnam's fortress, another fortification was on Winter Hill, and the "citadel" on Prospect Hill, was where, on 1 Jan. 1776, Washington raised the first colonial union flag. The city has a large amount of manufacturing interests, including slaughtering and meat-packing, cloth bleaching and dyeing, distilling and the manufacture of desks, pictures and frames and metal tubing. There are three public parks, a hospital, a home for the aged, in charge of the Little Sisters of the Poor, an insane asylum and a number of other charitable organizations. There are 31 churches and 28 school buildings. The educational in-

stitutions are English and Latin high schools, public and parish schools, several private business schools and a public library. In educational and industrial life Somerville is identified with Boston in many ways. The government of Somerville is vested in a mayor elected annually and a unicameral council. Pop. 77,236. Consult Samuels, 'Somerville, Past and Present' (Boston 1897), and Hurd, 'History of Middlesex County' (Philadelphia 1890).

SOMERVILLE, N. J., borough and county-seat of Somerset County, on the Raritan River and on the main line of the Central Railroad of New Jersey, 36 miles southwest of New York, 37 miles from Easton and 64 miles from Philadelphia. It is the trading centre for a large population, has a public library, hospital, two theatres, a courthouse, three banks, a high school, two public schools, eight churches and three weekly papers. It has manufactures of clothing, woollens, iron pipe, stoves, etc. The assessed valuation is \$4,820,130. Electric railroads afford easy access to surrounding districts and to neighboring towns. Pop. 6,038.

SOMME, sòm, France, (1) a river rising in the department of Aisne, seven miles northeast of Saint Quentin, flowing from southeast to northwest and falling into the English Channel. Its chief affluents are the Avre and Celle. It is 135 miles long and navigable from Amiens as far as Abbeville (q.v.) for vessels of 300 tons. It has canal connection with the Oise and the Scheldt. (2) The department of Somme in northern France has an area of 2,378 square miles. It consists of highly-cultivated and large, fertile plains and its highest point is at the southwest. Considerable land beyond the sand dunes of the coast has been reclaimed. The river Somme is the principal stream and on it is situated Amiens, the chief town. There are numerous industrial works—foundries, mills for textiles, paper, chemical, soap, lock, beet-sugar and other factories; important fisheries, etc. The exports include raw materials for manufacture, cider, timber, dyes, coal, horses and cattle. It is traversed by several railways. For the account of the engagements at the Somme during the European War, see WAR, EUROPEAN.

SOMMERVILLE, Maxwell, American archæologist: b. Philadelphia, 1 May 1829; d. Paris, France, 6 May 1904. Having spent many years in the collection of precious stones and historical gems, he became an authority upon glyptography and allied subjects and in 1894 was appointed professor of glyptology in the University of Pennsylvania. He is the author of 'Engraved Gems'; 'Sands of Sahara' (1901); a monograph entitled 'A Buddhist Temple' (1900), and other works.

SOMNAMBULISM (sleep-walking, sometimes called noctambulism), pathologically considered, is caused by persistent, strong, unconscious wishes of the individual which cannot be inhibited but which must be carried out without conscious knowledge of the sleeper. The acts are usually clothed in symbolism which mostly veils their real meaning events from the conscious onlooker. It is analogous to the hypnotic or mesmeric state. It is similar to somniloquy or sleep-talking. Hippocrates,

Aristotle and other ancient authors wrote upon it, and Galen is said to have been a victim to it. "The mind acts automatically under the dominance of some single idea. Sight, hearing and nearly all the avenues of sense are closed. The sleep-walker avoids obstacles and performs ordinary acts automatically, like an absent-minded man, which in reality he is." His train of thought is in accordance with his single idea, continuous and logical. Portions of the brain usually involved in the physiological conditions peculiar to sleep seem to be exempt. The sleeper exerts powers which sleep usually annuls; the direction of voluntary movements in most trying circumstances is marvelous; he may be quite deaf to all ordinary auditory impressions; his eyes are usually insensible to light; they may be closed, partly closed or wide open; the pupils may be widely dilated, contracted or normal. The somnambulist has been known to walk from one part of the house to another, to climb steep roofs or walk along their ridges with ease, to solve intricate mathematical problems, to write letters or work upon pictures, to attempt murder or suicide, etc. He is roused from this state with difficulty, when he remembers nothing of what has occurred.

Somnambulism very frequently is found in certain highly neurotic families. This is probably due to imitation from parent to child. It often occurs at about the age of puberty where strong sexual wishes under strong repression, seek symbolic outlets. Usually the somnambulist should not be awakened until he is safely back in bed. To remedy the condition an adequate psychoanalysis should be carried out. It will tend not only to cure the condition, but also aid the individual in the neurosis which is almost an invariable accompaniment or in the making. Consult Jelliffe, 'Technique of Psychoanalysis' (1918).

SOMNATH, sōm-nāt', or **PATAN**, a town on a bay of the Arabian Sea, in Gujarat, 210 miles northwest of Bombay, almost enclosed by a massive wall, flanked by 38 towers. Magnificent ruins, of which the great temple may be seen at a long distance, mark its former wealth and prosperity. It was one of the original seats of Siva worship in India and has recently again become a favorite place of pilgrimage. The town contains many memorials of Krishna, but most of the inhabitants are Moslems, who have erected many mosques. The port of the town is Verāwal. Pop. 10,000.

SOMNUS, in Greek mythology, the god of sleep, son of Nox (Night) and twin brother of Mors (Death). He dwelt at the western extremity of the world, where the imagination of early poets placed all awful beings. Some of the poets describe him as a handsome youth, some as a dull and lazy god, whose dark abode no ray of Phœbus enters. He is sometimes represented with a wreath of poppies; sometimes with a horn, in which he carries dreams.

SON OF GIBOYER, The. Émile Augier, the upholder of bourgeois virtues upon the French stage, produced in 1862 his excellent satirical comedy of manners 'The Son of Giboyer' ('Le Fils de Giboyer'). A year earlier, in 'Les Effrontés,' he had introduced Giboyer as a hack writer ready to sell his pen

to the highest bidder. In this sequel he made the character of his literary Bohemian more sympathetic, and, instead of attacking financial speculation and money-lust, assailed social corruption due to political influence and the attempts of the middle class to assume the titles of the nobility. Giboyer has been engaged to write a speech for Marechal, the spokesman of the aristocratic party, but no sooner has Marechal got his lesson by heart than the party leaders select another orator. Nothing daunted, Marechal now declaims a radical republican speech prepared by the same facile hand and reflecting Giboyer's true sentiments. The address creates a sensation, and Marechal, supposing it to be the composition of his young secretary, consents in gratitude to the latter's marriage with his daughter. It emerges, however, that the secretary is a natural son and that his father is the disreputable Giboyer, who has taken this means of assisting the youth in secret. Marechal is so far converted to democracy, however, that he interposes no objection to this match which he would earlier have disapproved. Even the Marquis d'Auberive, who has schemed to win pretty Fernande Marechal and her fortune for his nephew, abandons that ambition, and, blessing the lovers, offers to lend the protection of his name to the son of Giboyer. Although the comedy is old-fashioned in its easy conclusion and its reliance upon coincidences and asides, it sparkles with wit, and, in spite of much that is politically out of date, still lives, thanks to the universality of its satire. It has been translated into English by Benedict Papot (in *Drama*, November 1911) and receives full discussion in the French essays upon Augier by Morillot (1901) and Gaillard (1910).

FRANK W. CHANDLER.

SONATA, sō-nā'ta, a piece of instrumental music intended to express various feelings in different passages, according to the variety of expression of which the instrument is susceptible. The sonata usually begins with an allegro or lively passage, followed by an andante or adagio; then a minuet with a trio, or a scherzo, and lastly a rondo or presto. Instead of the second, third or last division, variations are also made use of. The older forms of sonata, the word signifying an instrumental composition as distinguished from cantata, were written in two or more divisions and like the modern sonata constituted a complete musical piece—the passages connected by a common character—and exposition, development and restatement with a conclusion artistically worked out. The sonata was originally designed for one instrument only, principally for the violin; afterward for the piano almost exclusively. Subsequently sonatas or double sonatas were composed in which the piano or harpsichord is accompanied by other instruments; for instance, the violin or flute, horn, clarinet. The expression of the sonata is to be determined by the character of the instrument—a circumstance which modern composers have not sufficiently observed. In sonatas for several instruments the principal instrument is either only assisted (as is the case, for instance, with many sonatas for the pianoforte accompanied by the violincello), or the instruments alternate, so as to make the

sonata a dialogue of instruments. An easy or short sonata is called sonatina. The most distinguished composers of sonatas are Haydn, Beethoven, Mozart, Mendelssohn, Clementi, Cramer, Hummel, Weber, Moscheles, Kalkbrenner, Field and Brahms.

SONDERBUND, zōn'dēr-boont, a league formed in 1846 by seven Roman Catholic cantons of Switzerland against the Federal Diet, which had decreed the expulsion of the Jesuits. The Diet voted the Sonderbund illegal 20 July 1847. Freiburg, their stronghold, was captured 13 November, Lucerne 24 November and the Sonderbund was dissolved.

SONG, a little poem intended to be sung; a lyric. The term is applied to either a short poetical or musical composition, but most frequently to both in union. As a poetical composition a song may be defined as a short poem divided into portions of returning measure and turning upon some single thought or feeling.

SONG OF BIRDS. The voice or song of birds results, like that of all higher vertebrates, from the vibration of vocal chords and of a column of air passing through the trachea or windpipe. In birds, however, the organ of voice is double and consists of an upper and a lower larynx or syrinx, the latter being the organ in which the voice or song is actually produced. The upper larynx is partly bony and partly cartilaginous, is situated at the glottis or opening of the trachea into the mouth and is of much simpler structure than the larynx of mammals, lacking the vocal chords. Except in the ostrich, American vultures and a few other birds, the syrinx is always developed. It presents great variety in size, form and disposition of parts. Its bony elements consist essentially of modifications of the lower rings of the trachea at the point of its bifurcation to form the bronchi and may be tracheal alone, or bronchial alone, or combine elements of both bronchi and trachea. The structure of the upper larynx, apart from experimental demonstration, proves that it is incompetent to produce the song-notes; and its chief office must, therefore, be that of modifying the song. The syrinx of the bird may be compared to "a reed prefixed to a tube." Its characteristic structure is the semi-lunar membrane, which is attached to the upper part of the bony structure known as the transversale or pessulus, which bounds the lower end of the windpipe.

This semi-lunar membrane is in fact one of the vocal chords, but a pair of others are formed from folds of the mucous membrane projecting into the interior from the upper bronchial rings and bounding the pair of syringeal glottis laterally. The great distinction existing between the syrinx of singing and of non-singing birds lies in the mobility of these parts and the arrangement of the muscles. In the true singing birds the latter are numerous, distinct and so attached as to produce the tensions or laxness of the vocal chords upon which the variety of notes depends.

The song of birds, like the notes of most, if not of all, other animals, is in a minor key. Usually the range of song-notes may be comprised within a single octave, but of course these limits may be, and frequently are, greatly

exceeded. The parrots, with a great range of voice and possessing great vocal capabilities, possess an inferior larynx, which differs from that of most other birds in being single in its nature. In the production of the peculiar shrill whistling of parrots the glottis is probably passive or silent — the column of air vibrating as in a flute, where a vibration is communicated by the air and traverses the elastic walls of the tube. Nearly all singing birds belong to the group *Oscines* and stand at the head of the class in perfection of general organization.

While much has been written in description of the songs of various species of birds and literature teems with tributes to the ability of feathered songsters and, although many songs have been reduced to words and others written in music, the philosophical side of the subject has been much neglected and a thoroughly comprehensive work is still a desideratum. One fact stands out very clearly, namely, that the vocal efforts of birds bear a close relation to sexual excitement. With many birds true song is confined to the period of mating and incubation and is replaced by the ordinary calls of alarm, etc., very soon after the young have hatched. In almost all it reaches its highest expression during that period and its effect is then heightened by various accompaniments of gesture, peculiar modes of flight, etc. Among true song-birds great vocal powers are almost confined to the males and are generally supposed to be the expression of greater vitality or to have resulted through selection by the females for their partners of those most gifted. A view which is gaining ground among zoologists is that the distinctive songs of birds are mimetic in origin and some consider that bird language, like human language, is not hereditary, but is learned anew from their parents by the young of each generation. Given an original exclamatory power of expression this has been given direction and augmented by the imitation of the various sounds of inanimate and animate nature, by which various species of birds were surrounded in their particular environment, just as the same elemental influences have been invoked to explain the origin of human language. In sexual selection, in the pleasure derived by a bird from its own music and in the needs for fuller power of expression are supposed to lie the forces effective in its further development.

Besides general works on ornithology, in which are included detailed descriptions of the songs of particular birds, consult Darwin, 'The Descent of Man' (Vol. II, New York 1871), and 'Expression of the Emotions' (New York 1873); Witchell, 'Evolution of Bird Song' (New York 1896); Rhoads, 'American Naturalist' (1899); Jones, 'Songs of the Warblers' (Oberlin 1900); Burroughs, *Century Magazine* (1898-99); 'Music of the Wild' (1910).

SONG TO DAVID, a notable lyrical poem, in 86 stanzas of six lines each, written by Christopher Smart (q.v.), apparently in lucid intervals during his mild madness and published shortly afterward in 1763. It was comparatively neglected in its day, but since its resuscitation in 1819 it has been highly praised, and it caused Browning to introduce Smart into his "Parleyings." The tradition that it

was written in charcoal on the walls and scratched with a key on the wainscot of its author's cell can contain but a nucleus of truth. That it is one of the noblest apostrophic poems of the language, full of Smart's piety, to which Dr. Johnson paid tribute, steeped in the sublimity of the Scriptural style and an extraordinary phenomenon both in the poet's works and in his conventional century is scarcely to-day subject for dispute. Some of the stanzas have a swift carrying or snatching power that makes Browning's reference to Keats and Milton seem a bit awry. Smart is himself, whether or not he was beside himself when he wrote his song to the "servant of God's holiest charge." And he was himself in a sense little perceived by his critics. There are poetic, especially lyrical, elements in his other works that make the 'Song to David' a little less inexplicable as the production of "Kit" Smart than many have found it to be. There is, for example, a stanza in 'The Judgment of Midas,' which, with the change of "Jove" to "God," would fit into the 'Song' in such a way that few readers would notice the intrusion. This reminds one of what is practically the only serious fault to be discovered in the poem—one not surprising when we consider Smart's mental condition—that its order of evolution is not always clear and that it might have been made longer or shorter without obvious loss. A convenient source for the text is G. W. Cooke's 'Guide-Book to the Works of Robert Browning' (1901, pp. 87-98).

WILLIAM P. TRENT.

SONG OF HIAWATHA, The. 'The Song of Hiawatha,' which Longfellow published in 1855, is the most notable of the many responses to the demand—very strong during the first half of the 19th century—that the myths and legends of the aborigines be made into a truly American poem. Characteristically, he took his measure from a European epic, the Finnish 'Kalevala,' but the substance was from actual Indian traditions as Longfellow found them in such writers as Catlin, Heckewelder and especially Schoolcraft, whose 'Algic Researches' (1839) contains an interesting prose version of much of Longfellow's material. The scene of the poem is the southern shore of Lake Superior, among the Ojibways. The action concerns itself with the life of a famous legendary prophet called Manabozho by the Ojibways, and by the Iroquois, Hiawatha ("he makes rivers"), who was said to have taught his people the beneficent arts of peace. Such a personage was of course more congenial to Longfellow than a mere fighter would have been. Hiawatha, though strong and valiant, fights only against the dangerous forces of nature. He clears the river channels, finds out how to cultivate maize, invents picture-writing; he is a gentleman and a true lover. Longfellow therefore had good reasons for selecting the gentler elements of Indian life and thought for his narrative, and it is partly beside the mark to say that 'Hiawatha' lacks its proper measure of savagery. Realistic its setting and personages are not, but the naive Indian legends, appealing in their barest form, have been kept fresh by Longfellow's tender sympathy and clear and cheerful, though somewhat facile, style. Fenimore Cooper had given the Indian

once for all his reputation as a crafty warrior. Longfellow added primitive goodness and religion to the perennial attributes of the Indian of romance.

CARL VAN DOREN.

SONG OF MYSELF. The poem in which the American author, Walt Whitman, chose to give an account of himself and his theory of poetic art. The substance of the poem forms, in a remarkable way, Whitman's *apologia*, and to it everyone must go who wishes to formulate anything like a correct estimate of the man and of his literary aims. It was first published in 1855, without a title; in 1856 as 'Walt Whitman, an American'; as 'Walt Whitman' in 1860, and until 1881, when the present title was adopted.

In its final form—for like everything of the author's it was carefully revised—the 'Song of Myself' consists of some 52 divisions of unequal length, and of no close or formal connection between parts, the unity of the work resulting from the fact that every part reveals some point of view, some half-realized emotion, some reflection or some vision of the writer. One is tempted to say of it by way of criticism that it is Walt Whitmanish through and through. It reveals to some degree everyone of Whitman's characteristics. The poem shifts at irregular intervals and in surprising ways from the cheapest slang to passages of rare poetic beauty. "I celebrate myself," says the poet at the outset; "I loaf and invite my soul; I lean and loaf at my ease, observing a spear of summer grass." The contemplation of the grass awakens Whitman's wonder, and forthwith he sets out on a contemplative journey that takes in the whole round of creation, every part and feature of which he pronounces good: "rich, apple-blossom'd earth," he exultingly cries, "Smile, for your lover comes." He tells us that as a poet he is only a mouthpiece; his thoughts "are the thoughts of all men in all ages and lands—they are not original." "If," he continues, "they are not yours as much as mine, they are nothing or next to nothing." In consequence, he feels that through him there speak "many long dumb voices," "many forbidden voices," "voices veiled," "voices indecent." At this point we begin to realize what Whitman was actually trying to do; and in the light of this *apologia* we come to understand that he is far more than the merely "indecent" poet that so many people would have us believe him to be. It takes a great poet to be the mouthpiece of all. Whitman may not have been great enough to compass the task fully, but his efforts are not to be made light of. Whatever else we may do, we must reckon with him. We shall not reckon with him aright until we have first got thoroughly at the heart of this 'Song of Myself.' To be sure there may be in it much that is self-contradictory; we must remember that Whitman is "afoot with his vision." Now and then, from his mountain heights, he strikes out such a great psalm as that "Immense have been the preparations for me," which comes to his lips when he turns on the "apex of the apices of the stairs" and looks past the phantoms which "rise after rise" bow behind him until he sees "afar down the huge first Nothing" from which he took his origin.

There is just one thing to do with the 'Song of Myself,' and that is to read it. It cannot be summarized; it cannot be paraphrased. It must be taken as it is. When we have said that it breathes in every line "the wild joys of living," the songs of a man who has looked upon life in all its phases and has found it good, the spirit of a man who has faith in the Power behind the universe, we have said all that we can. "I am not a bit tamed," writes the poet in conclusion; "I am untranslatable; I sound my barbaric yawp over the roofs of the world . . . I stop somewhere, waiting for you." Those who are going to read Whitman for the first should begin with this poem.

WALDO H. DUNN.

SONG OF SOLOMON. See CANTICLES.

SONG-SPARROW, a well-known sparrow (*Melospiza fasciata*), found in some one or other of its numerous races in all parts of North America except in the extreme north and south on the eastern side. The song-sparrow may be readily recognized by its thickly streaked plumage, brown above, ashy below, with the brown, black-centred streaks coalescing on the breast into a conspicuous spot. In most parts of the East song-sparrows remain throughout the year, but there is nevertheless a distinct north and south movement, the winter birds of any given locality being visitors from the North. In New England and most parts of the Middle States they are more plentiful in summer than in winter. During the latter season they associate more or less with flocks of fox-sparrows, white-throated sparrows and other species which frequent thickets along water-courses, but are much less gregarious than they. Their food consists of seeds of various kinds and in summer and autumn of insects and berries. They are chiefly birds of the ground and bushes and are never seen in the high tree-tops. Few birds surpass the song-sparrow in the real melody of their simple song, and few birds require so little of sunshine to start the joyous outburst even in mid-winter. They sing in every month of the year, but most persistently and sweetly during the breeding season. The nest, which is built on the ground or in a low bush or evergreen, is a bulky structure of grass, leaves, etc., lined with fine grasses or horse-hair, receives four to five greenish white eggs varied endlessly in the character of the spots and blotches of browns and lavender. Usually two or three broods are raised each season. Other eastern species of the same genus are the Lincoln's sparrow (*M. lincolni*) and the swamp-sparrow (*M. georgiana*), while, besides the numerous varieties of the song-sparrow in the West and Southwest, two distinct species (*M. insignis* and *M. cinerea*) occur in Alaska.

SONG-THRUSH, or **MAVIS**. In the United States the wood thrush is most conspicuous for its song. The thrush of Great Britain is also called song-thrush, while in Scotland it is known as "mavis." Song-thrushes are common throughout the temperate zone in Europe, resembling the American robin in their habits. The eggs are blue, spotted with brown. The male is dark brown, with golden brown tints in its wings. The throat is buff and the underparts yellowish white, flecked with brown.

SONGS OF INNOCENCE AND OF EXPERIENCE. William Blake's 'Songs of Innocence' and 'Songs of Experience' were originally published as separate volumes, with both text and illustrations beautifully engraved after Blake's special method of relief-etching, in 1789 and 1794 respectively. They were republished together about 1794 under the title of 'Songs of Innocence and of Experience, Showing Contrary States of the Human Soul.' The contemporary sale of the somewhat expensive volumes was very small.

The lyrics in the collection are full of the symbolism which characterizes all of Blake's writings, but they differ from most of his works in their intelligibility and in the more universal character of their appeal. The 'Songs of Innocence' represent the soul untouched by the experience of evil. To Blake the naïve and spontaneous consciousness of childhood was the ideal condition of human nature. Mature experience brings with it a separation of the spirit from the quickening and joy-giving contact with the divine sources of its true being. In his mystical philosophy all things are a single essence and of that essence the primary attribute is love.

"For Mercy, Pity, Peace, and Love,
Is God our Father dear;
And Mercy, Pity, Peace, and Love
Is man, his child and care."

Hence life, as seen in the 'Songs of Innocence,' is a continuous manifestation of sympathy and love in a world of pure joy, where envy, hatred and the consciousness of wrong have no place. Throughout this group the lamb and the child are symbols of innocent happiness; the shepherd, the nurse, the mother, the angels are the embodiments of all-enfolding love. Directly opposite is the atmosphere of the 'Songs of Experience.' The two sets of poems are full of correspondences, but in each lyric of the latter group the paradise of innocence is represented as blighted by the touch of evil. The idea is symbolically expressed in "The Sick Rose," where "the invisible worm," which cankers the bud, is reason, law, experience—the death of happiness and instinctive love. The two sorts of love, one spontaneous and unselfish, the other reasoned and calculating, are contrasted in "The Cloud and the Pebble." The failing sense of communion with the divine which comes with the mature consciousness is expressed in the last stanza of "The Angel":

"Soon my Angel came again;
I was armed, he came in vain,
For the time of youth was fled
And grey hairs were on my head."

In his emphasis on intuition and emotion and in his exaltation of the child as the true type of a pure humanity, Blake falls in with the cult of the primary instincts of human nature by the followers of Rousseau and anticipates doctrines familiar in the poetry of Wordsworth. As a poet he enjoys a more nearly unique position. Sometimes prosaically didactic, more often wayward and perverse, Blake at times shows himself a lyric genius of exceptional originality and power. The term "marvellous" best describes the effect of such a poem as "The Tiger," with its burning imagery and the on-rushing beat of its rhythm.

Marvelous, too, is the poignancy of "The Sick Rose" and "Ah! Sunflower, Weary of Time." But the more characteristic note is one of tender simplicity, in such pieces as the "Introduction" to 'Songs of Innocence' and "The Lamb," lyrics which have endeared Blake to all lovers of the poetry of childhood. The most convenient edition and the best critical memoir are to be found in Rossetti, W. M., 'The Poetical Works of William Blake' (Bohn Library). Consult also Symons, Arthur, 'William Blake' (1907), and the essay by Yeats, W. B., in 'Ideas of Good and Evil.' Bibliography in Cambridge 'History of English Literature' (Vol. XI).

JAMES H. HANFORD.

SONNECK, Oscar George Theodore, American musician, librarian and scholar: b. Jersey City, N. J., 6 Oct. 1873. He was educated at the universities of Heidelberg and Munich and at the Sondershausen Conservatory, later studying piano under Kwast and instrumentation under Knorr at Frankfurt. He was for a time engaged in research in Italy but in 1899 returned to the United States. He was appointed chief of the division of music at the library of Congress in 1902, which department under his direction has become one of the largest musical libraries in the world. His researches in the history of American music have proved highly valuable. From 1915 he also edited the *Musical Quarterly*. Author of 'Classification of Music and the Literature of Music' (1904); 'Bibliography of Early Secular American Music' (1905); 'Early Concert Life in America' (1907); 'Catalogue of the Dramatic Music in the Library of Congress' (1908); 'The Star Spangled Banner' (1914); 'Early Opera in America' (1915); 'Suum cuique: Essays in Music' (1916), etc. He is also known as a composer of music.

SONNENSCHN, William Swan, English publisher: b. London, 5 May 1855. He was educated at University College, London, and began the study of medicine. In 1878 he established a publishing business which since 1895 has been conducted as a limited company, under the name of Swan, Sonnenschein and Company, of which he is chairman. He is also joint managing director of George Routledge and Sons, Limited. He has published 'The Best Books' (1887; 5th impression, 1901), a classified dictionary of about 50,000 of the best available books, and 'A Reader's Guide to Contemporary Literature' (1901), a supplement to the foregoing.

SONNET, in poetics: (1) A short poem, song or ballad. (2) Specifically, a short poem of prescribed form restricted to 14 verses arranged according to a fixed disposition. The word came from the Italian *sonetto*, probably derived from the Old French and Provençal *sonet*, a diminutive of *son*, which was in turn obtained from the Latin *sonus*, a sound or musical air. That the sonnet originated in Italy seems now definitely settled, but the manner of its origin remains an object of discussion. D'Ancona ('Poesia Popolare,' 1878) as the result of his investigations, believes that it was developed by a combination of two popular stanzas, the *strambotto*, of eight verses, with a riming-scheme *a b a b*, etc., and the *rispetto*, of six verses, with a scheme *c d c d*, etc. Cesario, a later student ('La Poesia Siciliana,' 1894),

modifies this view by making the combination one of *strambotti*, the one of eight verses, the other of six. The beginnings of the sonnet appear to date from the early 13th century. It quickly attained popularity, and various writers attempted elaborations and other changes. Septisyllabic verses were inserted to vary the hendecasyllabic measure, the length of the sonnet being sometimes thus doubled; or verses might be appended, constituting a *coda* or *cauda*. The simpler arrangement, however, prevailed. At the same time, as to the riming-scheme, in the octave, or portion of eight verses, the arrangement *a b b a a b b a* replaced that of *a b a b*, etc., while in the sestet, or portion of six verses, it might be *c d e c d e*, as well as *c d c d*, etc. The sonnet was firmly established on this new basis by Francesco Petrarca (Petrarch), and this form has since been generally known as the Petrarchan. Boscan introduced the sonnet into Spain; Camöens, into Portugal. In France, Marot was the first great maker of sonnets, though it is maintained that this form of poetics was first introduced by Mellin de Saint-Gelais. The poets of the Pléiade were its chief exponents. In Germany they first appeared in the 16th century, but received their greatest impetus during the Romantic period, A. W. Schlegel, Goethe, Heyse, Eichendorf and Redwitz being among the sonnet-makers. Wyatt (q.v.) and Surrey (q.v.) introduced the sonnet into English literature in the middle of the 16th century. In England a modification was employed by Shakespeare, Drayton and others. This modification has been called the simple stanza in contradistinction to the Petrarchan, or compound stanza. The type is *a b a b a b a b a b c c*. The Shakespearean is distinguished in another way from the Petrarchan; for while the latter formally separated the octave and sestet, the former could not properly be said to have such a division—the arrangement being really three quatrains succeeded by a couplet—and the sense therefore might be continuous. In English the decasyllabic measure is the one generally used, although the octosyllabic is found. The Shakespearean type has not been to any extent used, the Petrarchan being regarded as the orthodox or standard. Deviations, as in the case of S. T. Coleridge, (q.v.) are called irregular sonnets or quatorzains; or, in Charles Lamb's whimsical coinage, "fourteeners." Critics point out what is called the Miltonic structure in the Petrarchan sonnet, Milton blending octave and sestet so that there is no pause in rhythm or thought. This modification has by Sharp ('Sonnets of this Century,' 1886) and others been distinguished as a separate type. The sonnet should be the vehicle of expression of one thought or idea, and the compactness and unity of the verse-form of course favor this. Hence the sonnet has been much used for what Watt-Dunton has styled "poetized didactics." The difficulties offered by the sonnet are considerable. The sense of mere ingenuity, except in the case of such facetiæ as Milton's 'On the Detraction Which Followed Upon My Writing Certain Treatises' (XI), is necessarily to be avoided. Even a partial list of sonnet-writers in English would require much space. A collection of British examples, from the Earl of Surrey to Alexander Smith, was made by J. Dennis (1873). American literature has in the

sonnets of Longfellow (q.v.), notably the series on the 'Divine Comedy,' many of the finest specimens in the language.

Bibliography.—Besides the above-mentioned works De Veyrière, 'Monographie du Sonnet' (1869-70); Tomlinson, 'The Sonnet' (1874); Welti, 'Geschichte des Sonnettes in der deutschen Dichtung' (1884); Gummere, 'Handbook of Poetics' (1885); Main, 'A Treasury of English Sonnets' (1880); Corson, 'A Primer of English Verse' (1892); Noble, 'The Sonnet in England' (1896); Vaganay, 'Le Sonnet en Italie et en France au XVIème Siècle' (1902); Herrick, 'A Century of Sonnets' (1902); Sharp, W., 'Sonnets of this Century with a Critical Introduction' (1887).

SONNETS FROM THE PORTUGUESE. 'Sonnets from the Portuguese' is the title of a sequence of 44 sonnets on the Italian model, written by Elizabeth Barrett Browning—Elizabeth Barrett, as she then was known—to her fellow-poet and future husband, Robert Browning. Aside from their nobility of thought and diction, they are noteworthy for their bearing upon a great love story that is unique in literary history.

Because she falsely believed herself a hopeless invalid and because of the certainty of parental objection, Miss Barrett had rejected Browning's offers of marriage until his ardor overcame her protests. The sonnets, written by her during their secret betrothal, reveal her doubts, her feeling of unworthiness, her gradual yielding, her exaltation in a great and wonderful love. It was several months after their romantic marriage that she placed the manuscript in her husband's hands. Browning, who declared, "I dared not reserve to myself the finest sonnets written in any language since Shakespeare's," with difficulty persuaded her to give them to the world. The name, 'Sonnets From the Portuguese,' invented by him to veil the true origin, was adopted partly because it suggested the love of Catarina and the Portuguese poet, Camões, and partly because "my little Portuguese" was a pet name that Browning gave his wife. While others have not gone so far in their praise as Browning in his pardonable enthusiasm, the high rank of the sonnets is beyond question; and Saintsbury has, in fact, said of the fourteenth of the sequence, that it "does not fall far short of Shakespeare's."

ARTHUR GUITERMAN.

SONNETS FROM VENICE. The common consent of critics and general readers ranks Platen's 'Sonnette aus Venedig' (1825) as the most perfect of their kind in German literature not alone for their faultless construction and musical cadence but also for their marvelous reproduction of all the moods inspired by the magic beauty of Venice with its ever-present historical monuments and by a melancholy sympathy for its fallen greatness.

To the original 12 sonnets Platen added five variants, a small number to be chosen from the voluminous writings of the most aristocratic and faultless master of German verse as his contribution to world literature. For Platen the City of Lagoons had a miraculous, mysterious, awesome beauty in its "labyrinth of bridges and canals" from which he took a regretful leave after two months of delight, with feelings akin to those of banished Ovid longing for Rome. The

"Neptunian city where divine honor is paid to winged lions by a glad-hearted people of charming idlers, everywhere the monument of fallen greatness, whose horses, captured in the sack of Constantinople, were humbled by the Corsican's bridle," revealed to Platen a wealth of power and gentleness even in its cold unyielding marble where "art grew from the sea like a gorgeous tulip." Von Klenze claims Platen as the "first visitor to be keenly alive to the charm of her Giovanni Bellini; to show sympathetic comprehension of the church of SS. Giovanni e Paolo and its treasures." But Platen's "first love in Venice," Bellini, gradually found a victorious rival in Titian, whose 'Ascension of Mary,' 'Peter the Martyr,' and especially 'John the Baptist,' incorporated for him the spirit of Venice.

CARL E. EGGERT.

SONNINO, sŏn'nē-nŏ', Baron Sidney Constantino, Italian statesman: b. Pisa, 11 March 1847. His father was a wealthy Tuscan of Jewish descent and his mother, *née* Georgina Terry, was English. He studied law at the University of Pisa and took his degree in 1865. His legal career was short, for he returned his first brief on the ground that the client was entirely in the wrong and the case unworthy of defense. From 1867 to 1871 he served in the diplomatic corps at the Italian legations in Berlin, Vienna, Paris and Madrid. Returning to private life at the close of the Franco-German War, his financial independence enabled him to devote himself to economic and scientific studies. In the early 70's he began an exhaustive inquiry into the economic conditions of Sicily in co-operation with Baron Franchetti. The result of their labor was published in two volumes in 1877 under the title of 'The Peasants of Sicily,' a work which attracted considerable attention. Extending his investigations to the southern provinces of the peninsula, Baron Sonnino, still a private citizen, probed the serious conditions of woman and child labor, emigration and industrial backwardness. Many valuable reforms were inaugurated at his instigation. Turning to journalism, he founded the weekly *La Rassegna Settimanale* in 1878, editing it for several years. In 1882 he converted the review into a daily paper, *La Rassegna*, which flourished for many years. He also founded the important *Giornale d'Italia*, of which he is believed to be the present proprietor. Elected a deputy to Parliament in 1880, he was soon recognized as an authority on finance, agriculture and foreign affairs. In view of what occurred over 30 years later, it is interesting to recall that in 1883 Baron Sonnino complained of the subordinate position of Italy in the Triple Alliance, and advocated a better understanding with Great Britain. He even hinted that Germany and Austria were playing a double game. His precise criticisms of the then prevailing chaos in national finance led to his appointment as Under Secretary for the Treasury in the second Crispi administration. In 1896 he became Finance Minister, in which capacity he laid the foundations of Italy's economic prosperity. He abolished corruption and secret subsidies, purified the administration and became leader of the constitutional party. He was twice Premier, in 1906 and 1909, for only a short time on each

occasion. Seeking neither popularity nor self-advertisement, he was unable to withstand the political machinations of Giolitti. On the resignation of the latter in March 1914 Signor Salandra became Premier, and when San Giuliano, the foreign Minister, died in October of that year, Baron Sonnino was called to the Foreign Office. The story of his remarkable diplomatic duel with Count Berchtold, Baron Burian and Prince Bülow between December 1914 and May 1915 is related under **ITALY AND THE WAR** (q.v.). With undeviating tenacity of purpose Sonnino resisted the promises, threats and blandishments of the central powers; he broke up the Triple Alliance, restored Italy's liberty of action and ranged her on the side of the Allies at one of the most critical moments of history.

SONOMETER. See **MONOCHORD**.

SONORA, sō-nō'rā, Mexico; except Chihuahua, the largest state of that republic; bounded on the north by Arizona and New Mexico (United States), on the east by Chihuahua, on the southeast by Sinaloa, on the southwest and west by the Gulf of California, and on the northwest by the territory of Lower California. Area, 76,900 square miles. The mountains of the eastern part of the state are the Sierra Madre and a number of secondary chains. Principal rivers are the Altar (also called Asunción or San Ignacio), Yaqui, Mayo, Sonora and Mátape. The chief port is Guaymas. In the mountains the climate is cool and occasionally cold; the flat western districts and the low, arid coast are hot, the thermometer sometimes recording 119° F. at Guaymas. In 'Mexico: a Geographical Sketch' (Bureau American Republics, 1900), "rain falling from a cloudless and serene sky," is mentioned as a "peculiarity" of the Sonora coast. The production of minerals in this state is especially noteworthy, there being extensive annual exports of silver, lead, gold, copper, coal, antimony, iron, cinnabar and graphite. The soil is fertile, but in many sections requires, and at present lacks, irrigation. The chief products are cereals, tobacco, cotton, sugarcane and fruits. Imports are machinery and agricultural and mining implements, material for clothing (cotton, linen, wool and silk), wines and liquors, hardware and arms and ammunition. Some of the pearls found in the Gulf of California are sent to European markets; otherwise all the foreign trade is with the adjacent States and Territories of the American Union. The only railway in the state runs from Guaymas to Nogales. The latter, being on the boundary-line between Sonora and the United States, is divided by a street into the two towns of Nogales, Mexico, and Nogales, Ariz. The capital of the state is Hermosillo (pop. 14,574), chief town of the rich mining district also called Hermosillo. Here are located the government palace, mint, cathedral and library. Pope Pius VI in 1779-81 created a bishopric including Sonora, Sinaloa and the two Californias. In 1842 Gándara, an ambitious provincial leader, made Sonora the theatre of a civil war. During the war with France (1862-67), interesting campaigns were conducted in the state. Hermosillo, captured 4 May 1866 by the republicans, was retaken by the imperialists; but the French forces were withdrawn from Guaymas in September of the

same year. Less than a decade afterward occurred the Yaqui War (1885-86). Total population of the state, 275,107.

SONS OF THE AMERICAN REVOLUTION, a patriotic American society, organized in New York in April 1889. Its objects are to perpetuate the memory and spirit of the men who achieved American independence by the encouragement of historical research in relation to the Revolution; the preservation of documents, records and relics, and to foster true American patriotism. There are branches of the society in various States. The total membership of the society is about 12,500.

SONS OF LIBERTY, an American patriotic association of the colonists called into existence by Lord Grenville's Stamp Act. They combined to throw off the allegiance to Great Britain and make America independent. The association began in New York and Connecticut. The Sons of Liberty joined the Society of Tammany early in the 19th century. See **TAMMANY SOCIETY**.

SONS OF THE REVOLUTION, an American patriotic society organized in New York in 1875 by John Austin Stevens and others. The practical work designed for the society includes the collection and preservation of manuscripts, records and other documents relating to the War of the Revolution. There are branch societies in various States, including California. The membership in 1910 was 7,560.

SONS OF TEMPERANCE. See **TEMPERANCE**, **SONS OF**.

SONS OF VETERANS, an American patriotic organization, founded in 1879. Those eligible to membership are all male descendants, not less than 18 years old, of all soldiers, sailors or marines who served with the Union forces in the Civil War. The insignia consists of a bronze bar bearing the words 'Filii Veteranorum,' from which hangs a red, white and blue ribbon to which is attached a medallion with the monogram S. V. The background is a wreath over crossed cannons. The monogram is surmounted by a spread eagle. Membership about 60,000. The Daughters of Veterans is a similar organization.

SONTAG, Henrietta, German opera singer: b. Coblenz, Prussia, 13 May 1805; d. Mexico, 17 June 1854. She was a favorite of the German operatic stage in her girlhood and later one of the most celebrated singers of Europe. In 1830 she was married to an Italian nobleman and withdrew from public life and to comparative retirement from the stage. In 1852 her husband's fortunes having been greatly altered by political changes, she made a tour through the United States and won fresh laurels by her voice and dramatic talent, but succumbed to an attack of cholera while singing in Mexico. Consult Berger, 'Berühmte Frauen' (Berlin 1904).

SOORD, Alfred Usher, English painter: b. 1867; d. Bushey, England, 9 Aug. 1915. His reputation rests mainly on his famous picture 'The Lost Sheep,' of which over 300,000 reproductions have been sold in the United States and the British Isles. He exhibited frequently at the Royal Academy and the Paris Salon.

Among his sacred subjects were a 'Crucifixion' and 'The Supper at Emmaus.'

SOOTY TERN. See EGG-BIRD.

SOPHIA, empress of Constantinople, niece of Theodora and wife of Justinus II. She was a beautiful, clever and ambitious woman, and after the accession of Justinian II to the throne in 565 was the real ruler of the country. Her husband's successor, Tiberius II, was chosen by her advice, and after the death of Justinus in 578 she planned to become the wife of Tiberius. Finding her designs frustrated she conspired against him, but her plot being discovered, she was deprived of power and compelled to live the remainder of her life in privacy.

SOPHIA DOROTHEA, wife of George I, king of England and elector of Hanover: b. 15 Sept. 1666; d. Ahlden, Hanover, 23 Nov. 1726. She was the only child of George William, Duke of Brunswick-Lüne-Celle, and in 1682 was married to her cousin, George Louis, then crown prince of Hanover. She had two children, George II of England, and Sophia Dorothea, wife of Frederick William of Prussia and mother of Frederick the Great. Her life at the court of Hanover was made exceedingly wretched by the relatives of her husband, who himself eventually was turned against her. She was accused of indiscreet relations with Count Philip Christoph von Königsmark, and the charges were substantiated by letters later proved forgeries. The count was assassinated in connection with the affair, and Sophia Dorothea was divorced in 1694. She lived the remainder of her life a prisoner at Ahlden, for which reason she has sometimes been called the "Princess of Ahlden." Consult Williams, W. H., 'The Love of an Uncrowned Queen' (1900); Greenwood, A. D., 'Lives of the Hanoverian Queens of England' (1909).

SOPHIOLOGY, sŏ'fī-ŏl'ŏ'jī, the scientific study of the origin and development of the philosophies of the various races of man. The science constitutes the natural history of science and philosophy from their earliest beginnings in the observations of primitive tribes, and traces their development into the achievements of civilized nations.

SOPHISTS, the designation applied to certain schools of philosophers in Greece, which occupied the transition period between the older and ruder cosmical philosophies, and the more refined subsequent systems, which beginning with Socrates, Plato and Aristotle, were founded primarily on the study of the human mind as the perceiving, thinking, reasoning and knowing subject. In the older systems the direct relation of mind to the objective universe did not receive prominent attention. The hypothesis of a unity in the external variety was assumed without dispute, and a theistic or materialistic interpretation of this unity formulated according to the tendency of the school. In this manner arose a succession of systems which were agreed in being artificial cosmogonies, unrelated if not hostile to the current traditions of religion, and however superior to these current notions as the efforts of great minds to comprehend the relations of things, they were still unable to stand the inevitable criticism of comparison with fact. Of this comparison and criticism the sophists were the exponents, and

its force fell both on philosophy and religion. But none of the sophists were really great men, at least in comparison with those who succeeded them, and they appeared in an age of political decline and social corruption.

The direct services of the sophists to philosophy appear to have been small and negative. It is too much to attribute to them as a merit the introduction of subjective philosophy. This, as its simultaneous appearance in different schools proves, was no more than a necessity of the period to which they belonged. What chiefly marks the sophists was their incapacity to generalize the subjective element, in consequence of which they were not philosophers properly so called, but only the critics of a dying philosophy. But the sophists rendered to science and literature, and even indirectly to philosophy, much greater services than as philosophers they were able to render to philosophy. They have been not inaptly compared to the French encyclopædists. They belonged to all the liberal professions; they taught all the usual branches of knowledge. Some of them were distinguished as rhetoricians and grammarians, others as men of science. They frequently made a profession of universal knowledge, and though from their overweening estimate of the newly found subjective element of knowledge they carried this pretension so far as to profess to speak of subjects of which they knew nothing, all their pretensions were not equally frivolous. Rhetoric, to which they naturally gave undue importance, was systematically studied by them, and they supplied some of the earliest models of good Greek prose. They are accused, however, particularly the later sophists, of being not only superficial in their attainments, but mercenary, vain-glorious and self-seeking in their aims.

Protagoras of Abdera, the earliest and one of the most important of the sophists, was contemporary with Socrates, but considerably older; he applied the Heraclitan doctrine of the universal flux of all things to the mind, maintained the uncertainty of the existence of the gods and the relativity of all truth. Man, he said, is the measure of all things. That is true for the individual which for the time being he perceives or feels. Sense and the gratification of sense are the only relations which subsist between man and the external world. All opinions are equally true, and contradictories may be affirmed with equal authority. Protagoras is said to have been the first who taught for pay, and though he left his pupils to fix his remuneration according to the amount of benefit they had received, he is said to have become wealthy. Gorgias of Leontini came to Athens in 427 B.C. as an ambassador from his native city. He affected great pomp, and studied to excel in the splendor of his rhetoric. Founding upon Zeno, he took a bolder stand in scepticism (q.v.) than Protagoras. His book was called 'Of the Non-Existent or of Nature'; and his three cardinal propositions were that nothing exists, that if anything exists it cannot be known, that if it could be known it could not be communicated. Gorgias reaches these conclusions by a logical quibble, in which he plays off Heraclitus against the Eleatic school. The scepticism of Gorgias, however, like that of other sophists, as it was founded on a superficial logic, was neither very profound nor

very consistently developed. His successors applied it chiefly in a moral direction, which made Plato call the art of rhetoric as taught by Gorgias a corruption of justice. Hippias of Elis represented the law as a tyrant in compelling men to act contrary to nature. Thrasymachus made the gratification of desire the natural right of the stronger and might the law of nature. Critias, one of the 30 tyrants, ascribed faith in the gods to the invention of politicians. Prodicus of Ceos taught a morality more in accordance with ordinary conceptions of right. Some of his moral discourses are preserved and are still admired for the feeling they display. His teaching was recommended by Socrates, and he has sometimes been called his predecessor. Prodicus is said to have been exorbitant in his charges for instruction. He taught rhetoric to Euripides. Consult Grote, G., 'History of Greece' (new ed., New York 1899); Schanz, M., 'Die Sophisten' (Göttingen 1867); and the various histories of ancient philosophy.

SOPHOCLES, sŏf'ō-klēz (496-406 B.C.), was born in the deme of Colonus near Athens. His father, Sophillus, was a man of middle rank and owner of many slaves. Hence he had the means to give his son a good education. Naturally, then, Sophocles was early introduced to Homer, who has left his impress on all the poet wrote. Music was not neglected. In this branch the young Sophocles was trained by the famous musician, Lamprus. He also frequented the palæstra and won prizes in gymnastic and athletic contests. His beauty and natural grace were exceptional. At the age of 15 he was chosen to lead the chorus that sang the pæan of victory of Athenian arms over Oriental despotism. Of the poet's relation to the great philosophers we know nothing; but we may be reasonably sure, from the internal evidence of his works, that his mind was not eager to pry into the unknown. With Voltaire he might have said "Adorons Dieu sans vouloir percer ses mystères."

Sophocles was born when Athens was beginning to rise toward the zenith of her glory and he died in his 90th year, just before her brilliant sun had set. He lived to witness the passing success of Athenian arms at Arginusæ, but died before her star was obscured by the cloud of Ægospotami. It was the century of Cimon and Pericles, of Phidias and Ictinus. Greece was the centre of the world, Athens the hearthstone of Hellas, the home of art, literature, science. But amid all this unrest, opportunity and glory, Sophocles lived a life of imperturbable placidity. Calm and self-possessed, he dedicated his life to his art. As Browning has well said, his even-balanced soul business could not make dull nor passion wild. Only one cloud cast a momentary shadow over his long and serene life; his son Iophon arraigned him before his deme as incapable of managing property. The old man refuted the charge by reciting the ode he had just composed on his native Colonus. For public affairs the poet showed no great aptitude. Pericles did not have a very high opinion of his strategic abilities, and the great statesman had an excellent opportunity of judging, for Sophocles was elected to serve with him as a general to conduct the Samian War. The ap-

pointment, we are told, was due to the success of his 'Antigone.' Later he became a colleague of Nicias. He was also a minor priest, and one of the treasurers that managed the tribute paid to Athens by her allies. The poet met Herodotus and composed an ode in honor of the historian. Sophocles was probably also acquainted with a great many other distinguished men. There is a wealth of ideas, a sprightly grace and a delicacy of views in his works that could not have developed in any other atmosphere. After the Sicilian reverse he was elected a member of the college of six magistrates created to propose measures of safety. In 411 he was appointed on a committee of 30 to modify the constitution; but he was conservative in politics and withdrew from all participation in their work when they proposed to rule without consulting the general assembly.

With his first tetralogy Sophocles competed with Æschylus for the tragic prize and won (468), although he was only 28 years of age. We are told that when the archon was hesitating to draw lots, Cimon, who had just returned from his conquest of Scyrus, entered the theatre and proceeded to pour out a libation to Dionysus, whereupon he and his fellow-generals were detained to act as judges. Henceforth Sophocles was master of the stage. He produced on an average one tetralogy every two years. No other tragic poet ever secured a greater number of prizes. Sometimes, in the earlier days, he took the leading part himself. He not only played acceptably the title rôle of Nausicaa, but he also distinguished himself by his grace in dancing. Æschylus died in distant Sicily; Euripides mid the wilds of Macedonia; but Sophocles, though invited by foreign potentates to their splendid courts, lived and died in the city of his birth. Sophocles' manners were affable and pleasing. His conversation was full of that Socratic irony which we find so charming in the dialogues of Plato. Endowed with a serene composure of manner and gifted with gentleness, beauty and intellect, small wonder that his contemporaries believed that the poet was beloved by the gods. After death the Athenians worshipped him as a hero. To the whole Greek world he was known as the Attic Bee. But in the natural sweetness of his temper there was something bitter—a tang which produced the flavor. It was his charm and grace that commended Sophocles especially to the Greeks. He was a more perfect artist than Æschylus and Euripides. The Periclean Age showed a decided preference for him over the other two. In the eyes of the Athenians, Sophocles was next to Homer, unsurpassed in wit, sweetness, discourse, art.

Sophocles found the art-form already developed. But he tempered the tone of tragedy, the material of which he narrowed to the compass of a single play: there is no nexus between the parts of his trilogies. In Sophocles, too, the characterization becomes sharper, and the dialogue moves more briskly, the action becomes more complicated, the meshes of intrigue finer. There is also a marked difference between Sophocles and Æschylus in the space devoted to the chorus. The lyric simply reflects, no longer bears the piece, though it is still an integral part of the action. But the plot is developed with consummate skill and with the most exact

thoughtfulness. The plot of 'Œdipus Rex' is so subtly articulated that each episode, each period, each verse, becomes an indispensable part of the whole. Not even Edgar Allan Poe strove more earnestly for totality of effect. It is this articulation that makes conspicuous the "irony" that runs through Sophocles. But it is particularly in the portrayal of character that Sophocles is in advance of Æschylus. The latter evokes fear, Euripides pity, Sophocles both — and in due proportion. The plot assists in the development of the character. The poet's theme is man. His heroes are ideal, but they show genuinely human traits. The gods are kept in the background. As in Æschylus, they control the action, but from a point so high above our horizon that we are not conscious of their domination until we reach the *dénouement*. Sophocles was not only a dramatist: he was also a poet. In all Greek poetry there is a strong current of feeling for external nature; but in Sophocles this feeling is always exquisitely adapted to dramatic effect.

Many innovations were made by Sophocles. He increased the number in the chorus from 12 to 15, developed the parados, introduced a third actor and made great use of stage scenery. Sophocles has his inevitable perfection; but he is not uniform enough to be faultily faultless. His poetry is never jejune, but succulent, full of sap and marrow; and he is the one consummate master of style, melody, vocabulary and versification, the one poet that always maintains a noble Homeric grace, that never sinks below the calm level of high art. His style is vigorous, but it is also marvelously subtle. No poet better combines severity with variety and sweetness with vigor in his rhythmic measures. He always adapts rhythm to expression. His choral songs are constructed with the skill of a master architect. Of the hundred and more plays which Sophocles wrote seven have come down to us. In 'Œdipus Rex' Sophoclean art reaches its highest point. The 'Trachiniæ' is the least popular; nevertheless, it is a good play. The 'Œdipus at Colonus' is the least dramatic, but its charm and breadth indicate that it is the work of the poet's best years. The earliest extant play is the 'Ajax' (451). The 'Antigone' was produced three years later. The 'Philoctetes' is one of the latest (409), while the 'Œdipus at Colonus' was brought out (401) by his grandson after the poet's death. The 'Electra,' though hard for a modern to appreciate, is the only one on this theme that thoroughly satisfies, the 'Chæphori' of Æschylus and the 'Electra' of Euripides being inferior.

JOSEPH E. HARRY,

Author of 'The Greek Tragic Poets,' etc.

SOPHOCLES, Evangelinus Apostolides, American Greek scholar: b. Tsangaranda, Thessaly, 8 March 1807; d. Cambridge, Mass., 17 Dec. 1883. He was educated at Amherst College. In 1842 he became a tutor in Greek at Harvard, and in 1860 professor of ancient and modern Greek there. His chief work, a 'Greek Lexicon of the Roman and Byzantine Periods,' was published in 1870. He wrote also a Greek grammar (1838); 'History of the Greek Alphabet' (1848); 'Glossary of Later and Byzantine Greek' (1860), revised as 'A Greek

Lexicon of the Roman and Byzantine Periods' (1870).

SOPHONISBA, Carthaginian lady, daughter of Hasdrubal, son of Gisco: d. about 204 B.C. She was early betrothed to Masinissa, a Numidian prince, but in 206 B.C. her father gave her in marriage to Syphax, a rival Numidian prince allied with Carthage. Masinissa was allied with the Romans, and in the Second Punic War he defeated Syphax and captured Sophonisba. He either married her or was about to do so when Scipio Africanus interposed, fearing that Sophonisba might influence him in favor of Carthage, Masinissa's former ally. To save Sophonisba's falling into Roman captivity Masinissa provided her with poison, with which she killed herself. Her story has been the theme of many tragedies, among them those of Nathaniel Lee (1676); Thomson (1730); Trissino (1529); Del Carretto (1502); Mariet (1631); Corneille (1662); Alfieri (1783).

SORA, a bird of olive-brown above striped with black and streaked with white, found in marshes of the Atlantic coasts of the United States. It is a member of the rail family. The species *Parzana carolina*, or Carolina rail, frequents the marshes of the Atlantic Coast in great numbers in the early Fall. It attains a length of about eight inches. During the breeding season the underparts become a slate gray and the face and throat become black. The bird makes a nest of grass on the ground in its swampy retreat and lays from 7 to 15 eggs, buff colored with brown spots. It breeds from the Middle States north and in winter is most numerous from Virginia southward. See RAIL AND RAIL SHOOTING.

SORANUS, Greek physician: b. Ephesus and lived in the reign of Trajan and Hadrian, 98-138 A.D. He practised medicine at Alexandria and at Rome, and wrote several medical treatises, as well as a life of Hippocrates which is the main source of our information concerning the great physician. The lives of other physicians written by him have been lost. Of his medical treatises two remain in the original, 'On Fractures' (Ideler, J. L., 'Physici et Medici Minores,' Vol. I, 1841); and 'On Diseases of Women' (Rose, V., 1882). His most important medical work was 'On Acute and Chronic Diseases,' of which but a few fragments of the original remain, but of which a Latin translation by Cælius Aurelianus is in existence. Consult Christ, W., 'Geschichte der griechischen Literatur' (5th ed., 1913).

SORATA, sô-rä'tä. See ILLAMPU.

SORBON, Robert de, French theologian, founder of the Sorbonne: b. Sorbon, 9 Oct. 1201; d. Paris, 15 Aug. 1274. He studied for the priesthood, became canon at Cambrai and then through the influence of the Comte d'Artois, was appointed chaplain to King Louis IX. He gained the esteem and patronage of the pious ruler, who aided him in his chief project. This was the foundation of a college, or rather place of study, for students of theology. The result was the establishment of La Sorbonne. Several of his treatises and sermons have survived. Consult Jadart, M., 'R. de Sorbon' (Rheims 1880).

SORBONNE, sör'bôn, Paris, France, a celebrated college of Paris, founded in the 13th century at the instigation of Robert de Sorbon (q.v.). The school was erected near the Palais des Thermes, in what is now the Quartier Latin. The name was originally "La Communauté des pauvres maîtres étudiant en théologie" but by popular usage "La Sorbonne" was substituted. The ancient college was not a place of classes and lectures, but rather a residence hall for students of theology. There were several grades of students: beneficiaries, residents and associates. The administration was entrusted to a principal, a prior, a procurer and a librarian, all elected at a general assembly. Students of all countries were admitted until the 15th century, when it was opened only to French students. The library grew to such large proportions that in 1841 a separate building was erected. The influence of the Renaissance brought about the founding of several chairs in the humanities, particularly in Greek philosophy.

The most important event in the history of the Sorbonne in the 17th century was the reconstruction of the buildings by Richelieu, the "second founder." Enlarged and well established now, the college became more than ever before the centre of intellectual activity. It was hostile toward the Reformation and toward the new spirit of scientific inquiry which animated the Cartesian school. In its religious doctrine, it remained Jansenistic and conservative.

In 1792 the entire school was abolished by decree. It was not revived until 1821, when it was re-established with the three faculties of theology, science and letters. In 1852 the Sorbonne was given to the city of Paris and became incorporated in the university; the *Ecole pratique des Hautes Etudes* was added in 1868. Some 20 years later, the faculty of religion was dispersed and the Sorbonne, which had led the intellectual religious thought of France for several centuries, became purely secular and scientific in its courses.

The new building was erected in 1889 from the plans of M. Nenot, winner of a "Grand Prix de Rome," the front of which, on the side of its official entrance, extends 274 feet along the Rue des Ecoles; then in an irregular oblong of from 700 to more than 800 feet, the building climbs the hill along the Rue Saint Jacques. Incorporated in the building is the 17th century church containing the tomb of Cardinal Richelieu. The building has hundreds of lecture-rooms, well fitted for their purpose, and many excellent laboratories.

It serves for the two faculties of letters and sciences of the university. It includes none of the professional scientific schools, which are located in the vicinity. The new Sorbonne also contains the *Ecole Nationale des Chartes* which has a remarkable library of archives. The professors number more than 100 and the students some 10,000. There are also numerous assistants. Consult Franklin, A. L. A., 'La Sorbonne, ses origines, sa bibliothèque, etc.' (Paris 1875); Geard, O., 'Nos adieux à la vieille Sorbonne' (Paris 1893); Rashdall, H., 'Universities of Europe in the Middle Ages' (Oxford 1895); Agathon, 'L'Esprit de la nouvelle Sorbonne' (3d ed., 1911).

SORCERY. See WITCHCRAFT.

SORDELLO, sör-dél'lô, Italian poet: b. near Mantua, Italy, about 1200; d. about 1270. He was one of the most celebrated of the early Italian poets who wrote in the style of the earlier troubadours and in their Provençal language. His history is variously narrated. Benvenuto d'Imola, Dante's commentator, describes him as a citizen of Mantua, a fine soldier and a courtier. He lived at the time of Ezzelin of Romano whose sister Cuniza conceived a violent passion for the poet. She pursued him, and since he was still deaf to her pleas, and on the instigation of the suspicious Ezzelin resorted to flight, she plotted to have him captured and slain. The story of his life is the subject of Browning's 'Sordello,' and is mentioned by Dante in his 'Divine Comedy' where he appears in the 'Purgatorio' as the type of excessive patriotic pride. His best-known poems are 'L'Ensenhamen d'onor,' and the complaint over the death of Blacas, in which the sovereigns of the world are invited to partake of the heart of the brave man. Some 30 of his poems have survived.

SORDELLO, a narrative poem by Robert Browning (q.v.), first published in 1840. It is based on the study of an historical but indefinite character, Sordello, the most celebrated of the Italian troubadours, b. Mantua, at the beginning of the 13th century, who owes his fame to the works of later poets from Dante to Browning rather than to the originality of his adventures or to the excellencies of his verse, chief of which are the didactic poem 'L'Ensenhamen d'onor,' some love songs and satires. Like 'Paracelsus,' published in 1835, Browning makes his 'Sordello' a study in the psychology of genius, illustrating its besetting temptations. Sordello the poet, distracted between the demands of idealism and imagination and the desire to utter the thoughts of humankind, finally gives up poetry for practical politics and gets into difficulties which can only be solved by his death. Browning is said to have devoted more time to Sordello than to any other work, and probably became so familiar with the story which he set out to tell that he failed to make allowance for the general reader, for the obscurity generally complained of in his verse reached its climax in 'Sordello.' This is owing to the subtlety and intricacy of the psychological expositions as well as to the vagueness with which the story is rather hinted than told. The obscurity of his style and philosophical subtleties, due it is believed to Germanic tendencies inherited from the maternal grandfather, injured his literary reputation with the reviewers, and it was not surprising that ordinary readers were puzzled and indifferent, and that the general recognition of his genius was long delayed by the reputation he acquired for obscurity. Sordello, however, with its powerful analysis of character and appreciation of the subtler springs of conduct, exhibited all the qualifications of a great dramatist. Abounding in descriptive passages of genuine poetry, the subtlety and vigor of thought are surprising and justify the frequent comparisons of higher critics to Shakespeare.

SOREL, sô-rêl, Albert, French author: b. Honfleur, 13 Aug. 1842; d. 29 June 1906. He

was a correspondent of the academies of Cracow, Munich, Copenhagen, Stockholm and Berlin, and of the Royal Historical Society of London; he was licentiate of law, secretary-general to the president of the Senate, 1876-1902; president of the upper commission of national archives, vice-president of the commission of diplomatic archives; also, professor at the Free School of Political Sciences. He wrote 'Histoire diplomatique de la guerre franco-allemande' (1875); 'L'Europe et la révolution française' (1885-1904); 'Etudes de littérature et d'histoire' (1882-1901); 'Madame de Staël' (1891).

SOREL, Georges, French author: b. Cherbourg, 1847. He was educated at the Ecole Polytechnique, and afterward became a civil engineer with the Department of Bridges and Highways, but resigned from the service in 1872. He was one of the founders of *Devenir Sociale*, to which he became a contributor, also contributing to *Le Mouvement Socialiste*, and other periodicals. He is a leader of the syndicalist movement and one of the foremost writers on the subject. Author of 'Le procès de Socrate' (1889); 'L'Avenir socialiste des Syndicats' (1900); 'Saggi di critica del Marxismo' (1903); 'Reflexion sur la Violence' (1909; Eng. trans., Hulme, T. E., 'Reflections on Violence,' 1912; 2d ed., 1915).

SOREL, Canada, town and county-seat of Richelieu County, Quebec, on the Richelieu River at its confluence with the Saint Lawrence at Lake Saint Peter, and on the South Shore and Quebec Southern railways, 45 miles northeast of Montreal. It is built on the site of a 17th century fort, and was formerly called William Henry. It has a good harbor, which is the winter quarters for many of the Saint Lawrence River steamboats. It also has extensive ship-building and ship-repairing interests and manufactories of mill machinery, engines, ship stores, plows, leather, stoves, brick and tile, flour and lumber. The trade in grain and farm produce is important. The town is well built, has substantial county and other public buildings, good schools, a number of handsome churches, hotels, banks and weekly newspapers. Pop. about 8,500.

SOREL RIVER. See RICHELIEU.

SORGHUM, sôr'gûm, an annual cane-like plant (*Holcus sorghum*), resembling Indian corn in general appearance and habit of growth. The sorghums are without ears, and are distinguished by heavy heads of small seeds which terminate the stalk. (See GRASSES). The cultivated varieties are usually treated as a distinct species by botanists, but some prefer to consider them as derived from a wild species, *Holcus halepensis*. The sorghums have been known from the remotest periods of history, and the cultivation of sorghum probably had its origin in Africa, where a variety called durra is grown over the whole continent, and is put to a variety of uses; the negroes chew the stem for the sugar, and make alcoholic drinks from the grain. Varieties of sorghum were known in China from a very remote period. The first sweet sorghum seed to reach the United States came from that country; in 1855, and in 1856 from South Africa. The sorghums are remarkable for their adaptability to differing conditions of soil and climate, and an almost endless list of

varieties exists, which may be divided into two main groups based upon the character of the sap. Those containing a considerable amount of sugar are classed as saccharine sorghums; those weak in sugar as non-saccharine. The name "sorghum" is applied in common use to the saccharine varieties only, while the non-saccharine kinds commonly bear the name of their species, as Kaffir corn, durra, etc. The several varieties of the sweet sorghums are so nearly alike that little distinction is made in treating them as a class. The two leading varieties are the amber and the orange, the former being the favorite in the more northerly latitudes of the United States, and the latter in the South and the Southwest. Sorghum thrives in every part of the United States except in the colder parts of New England and in the higher parts of the Rocky Mountains. At first it was grown exclusively for the manufacture of syrup and sugar, but as its value as a forage crop became known, the area devoted to its cultivation increased rapidly.

Saccharine Sorghums.—The Civil War caused a scarcity of sugar in the United States, and sorghum syrup came into widespread use as a substitute. In 1860, five years after the first seed was introduced from China, 6,749,123 gallons of sorghum syrup were made and consumed in the United States. In 1870 the production had swelled to 16,050,089 gallons, and in 1880 to 28,444,202 gallons. Since that time the production of sorghum has shown a steady decrease, being only 16,532,382 gallons in 1918. In the manufacture of syrup the stalks are stripped of their leaves after the seed has ripened, and the tops are cut off. The stalks are then cut off close to the ground and passed through heavy rollers to extract the juice, which is then boiled in shallow pans until a syrup of the desired consistency is obtained. The greater part of the sorghum now manufactured is a farm product, all of the operations of manufacture being performed on the farm. In 1878 the United States Department of Agriculture took up experiments to ascertain whether sugar could be manufactured profitably from sorghum. Two objects were aimed at in the experiments, (1) to discover a cheap process for extracting the juice and making the sugar and (2) to increase the sugar content of the plant. Considerable progress was made along both these lines, and the chemists in charge of the work at one time thought that sorghum would become a competitor of sugarcane as a source of sugar. Attempts were made by capitalists to manufacture sorghum sugar on a commercial scale, but none of these attempts have proved successful. The only satisfactory process of getting the sugar to crystallize properly involves the use of a large amount of alcohol, which, under present government regulations, is so expensive as to make the process impracticable.

Sorghum is valued highly by stockmen as a soiling crop, and makes good summer pasturage for all kinds of stock. Its high sugar content gives it an especial value in fattening swine, and it is also an excellent food for sheep. As ensilage it makes good feed, but on account of the difficulty in preventing the development of acidity in the silo, other crops are generally preferred for this purpose. Sorghum is of especial value as a pasturage plant, owing to

the fact that it is at its best in midsummer, when other grasses are generally of the least service. The heavy yield of hay makes it one of the favorite forage crops. In pasturing, care is necessary on first turning stock upon sorghum, owing to the danger of bloating.

The time for planting sorghum varies according to latitude from the 1st of April to the middle of June. In general the best results are obtained by sowing the seed broadcast or with a drill, as oats or wheat are sown. When intended for a soiling crop it is sometimes better to sow in rows far enough apart to admit of plowing between the rows. The amount of forage yielded per acre varies according to soil, climate and methods of cultivation, and ranges up to as much as 15 tons of the cured hay. Two or three crops are sometimes harvested in a single year, and as much as 10 tons is sometimes obtained from a single cutting. Experiments at the Nebraska Experiment Station showed sorghum to be the heaviest yielder of all the forage crops at that station. It is a deep-feeding plant, and gives better results on poor land than does corn, but is more exhausting to the soil. In feeding sorghum the whole plant is usually used. The seed alone has a feeding value of about 90 per cent of that of corn, and is valued highly for poultry, especially for laying hens. Bulletin 15 of the Department of Agriculture compares the composition of sorghum seed and corn as follows: Corn (shelled), water 10.9; ash 1.5; fibre 2.1; fat 5.4; protein 10.5; nitrogen-free extract 69.6; sorghum seed, water 12.8; ash 2.1; fibre 2.6; fat 3.6; protein 9.1; nitrogen-free extract 70.0.

Non-saccharine Sorghums.—These exist in many varieties, all with the same general habits of growth, being slow to germinate and requiring a long period to mature seed as compared with corn. They differ in the length, thickness and strength of the stem, in the number and size of the leaves and in the position of the seed-head. The principal varieties are Kaffir corn, Milo maize, durra (doura, dhourra or dhoura), Jerusalem corn and broom corn. All of these varieties except the last are grown principally as feed for stock. The peculiar adaptability of broom corn to the manufacture of brooms and brushes has led it to be devoted entirely to this purpose.

Kaffir corn is the best known of those grown as feed for stock. It was introduced from South Africa about 1884, distributed by the Department of Agriculture and has been found well fitted to the semi-arid regions of the West and Southwest, where corn has never been a reliable crop. It is now extensively cultivated in Oklahoma, western Kansas and other places where lack of moisture gives this crop an advantage over corn. In appearance Kaffir corn resembles sorghum, but does not grow so tall. The leaves are large and long, the head is upright and compact, and the seeds vary in color according to variety. Three distinct species have been generally agreed upon—red, white and black-hulled white. The last frequently goes by the name of African millet. Kaffir corn is used chiefly for a fodder crop, is planted in drills and cultivated like corn or sorghum. Where it is proposed to feed the whole fodder to stock, the crop is cut and shocked as soon as the grain is ripe. Where the heads are to be harvested by themselves various methods of

harvesting are used. The yield is about the same as that of corn grown under the same conditions, except in dry, hot regions, where the Kaffir corn will outyield Indian corn. The crop of fodder produces up to eight tons per acre or more, but the seed has a lower feeding value than corn. The grain has been used as an article of human food, making a meal similar to corn-meal. The acreage of Kaffir corn is about 266,513 acres, and the yield of grain averages annually about 5,169,113 bushels.

Milo maize closely resembles Kaffir corn, but grows to a greater height. It is marked by a heavy foliage and an abundance of suckers. Owing to the fact that it requires a long period to mature it has been found best adapted to cultivation in the Southern States. Two varieties are grown in the United States, white and yellow.

Durra differs from Kaffir corn principally in the position of the head, which hangs downward from the end of the stalk, the culm being recurved just below the panicle. This variety includes Egyptian corn, rice corn, guinea corn, etc. The grain is a favorite poultry-food, and the plant has been extensively cultivated in some parts of the United States for this purpose. It is also valuable as a forage plant.

Jerusalem corn grows to a height of four to eight feet, but produces less forage than other varieties. The grain yield is large as compared with that of other non-saccharine sorghums, but is hard to save, owing to the fact that the grains are without husks and shatter easily. The head hangs downward on a recurved stalk as in the case of durra.

Broom Corn.—Broom corn is the oldest variety of the non-saccharine sorghums cultivated in the United States. Brooms were made for sale in the United States as early as 1798, and the plant was cultivated for home use for some time previous to this. The usual development of the stems of the seed-cluster adapt it perfectly to the purpose of brooms and brushes, and it is not cultivated for any other purpose, although sometimes fed to stock after the brush has been removed. There are several varieties, whose distinctions depend on the size and coarseness of the plant and the quality of the head. The plants are usually grown in drill rows. The heaviest producers of broom corn are the States of Illinois and Kansas, though considerable quantities are produced in many other States. The American broom corn is superior to that grown in Europe for purposes of broom manufacture.

Diseases of Sorghum.—Sorghum blight (*Bacillus sorghi*) is a bacterial disease in which the leaves or leaf sheaths are attacked by small red spots and patches of various shades and sizes. The roots are also subject to attack from the same source, and the vitality of the plant is so affected that it is either stunted or killed. The disease is worse on some varieties than others, but it attacks both the saccharine and the non-saccharine varieties. Of the smuts, *Ustilago sorghi* and *U. reiliana* are dreaded. The former attacks the grain, causing it to swell up and burst, and the latter attacks the entire head, converting it into a large black mass which is covered at first by a whitish membrane. No preventive treatment has been applied successfully.

Sorghum Poisoning.—Cases have been fre-

quent, especially in the semi-arid districts, of cattle dying from eating even a little green sorghum, usually a second-growth. Investigations carried on by the Nebraska Experiment Station go to show that under some conditions sufficient prussic acid forms in the leaves of the plant to cause the death of an animal. The danger is confined to the feeding of the green plant.

SORITES, sō-rī'tēz, in *logic*, a chain of elliptic syllogisms — of syllogisms in which the conclusion of all except the last is omitted. The syllogisms are stated in a series of propositions so linked together that the predicate of each is the subject of the one next following, until a conclusion is formed by bringing together the subject of the first proposition and the predicate of the last. The chain can be carried to any length provided it is perfectly consecutive, so that each term except the first and the last occurs twice, once as subject and once as predicate. Example of sorites: Every A is B. Every B is C. Every C is D. Every D is E. Therefore, every A is E. The term is also used to designate a fallacy wherein it is argued that since the addition of each single object to a collection of objects does not change the collection up to a certain point, therefore, such addition can be made indefinitely without changing the collection.

SOROCABA, sō-rō-kā'bā, Brazil, a town in the state of São Paulo, situated on the railroad, 55 miles west of São Paulo. It lies in the midst of a rich agricultural and grazing district, and important fairs for the sale of horses and cattle are held in the town annually. Pop. of commune about 17,000.

SOROLLA Y BASTIDA, Joaquín, Spanish artist: b. Valencia, 1863. He studied at the academy at Valencia, and later in Italy and Paris. He achieved wide recognition upon the exhibition of his 'Another Margaret' (1892) which was awarded a gold medal by Madrid, and was purchased by the Saint Louis gallery. Thereafter his successes were continuous and remarkable, and he is generally considered the leader of modern Spanish painters. His work includes landscapes, figure paintings and portraits, and is of the impressionistic school. His exhibit at the Paris Exposition in 1900 was awarded a medal of honor, and after his phenomenally successful exhibit in Paris in 1906 he was made an officer in the Legion of Honor. His exhibits at London in 1908 and at the Hispanic Society, New York, in 1909, were also remarkably successful. Among his paintings are 'Fishing Boats Return' (Luxembourg, Paris); 'Sewing the Sail' (gold medals, Munich and Vienna); 'A Sad Inheritance' (church of the Ascension, New York); 'Swimmers' (Metropolitan Museum, New York); 'After the Bath' and 'Beaching the Boat' (loaned to the Metropolitan Museum by the Hispanic Society); portraits of King Alfonso XIII and of Queen Victoria of Spain (Hispanic Society, New York), etc. Others of his works are in the Berlin National Gallery, the Venice and Madrid Museums and in private collections in England and America.

SOROSIS, the name of the first professional woman's club established in the United States. Sorosis was founded in 1868 by Mrs. "Jennie

June" Croly (q.v.) and some of her literary associates in New York. Mrs. Croly was for many years the president of the society.

SORREL, SORREL-TREE, SORREL VINE, etc., are the like names of several unrelated plants having acidulous or "sour" foliage. The field or sheep sorrel is the *Rumex acetosella*, a common pasture weed, naturalized from Europe, with halberd-shaped leaves, impregnated with oxalic acid, slender panicked racemes of delicate diœcious flowers, with six-parted green or reddish calyces. It spreads widely by creeping rootstocks and in late summer colors large patches of dry fields and hill-sides by its crowded rusty-hued flower stalks and foliage. This species, *R. acetosa*, and particularly *R. scutatus*, which is cultivated for the purpose in Europe, are used for salads, soups and as vegetables. They are cooling, diuretic and anti-scorbutic plants. The wood sorrel may be any one of the American species of *Oxalis*, low plants with succulent tripartite leaves and obcordate leaflets and pretty solitary or umbellate five-parted flowers, white, pink or yellow, and with sharply acid sap. Indian sorrel is the roselle, an East Indian mallow (*Hibiscus sabdariffa*) cultivated in the tropics for its acidulous calyces which are made into refreshing drinks, jellies and tarts. Switch sorrel is *Dodonæa viscosa*, a widely distributed tropical shrub, with acid and bitter foliage. Climbing sorrel is the shrubby *Begonia scandens*, which climbs by rootlets. The sorrel vine is a low, tendril-bearing climber (*Cissus acida*) of tropical America. *Oxydendrum arboreum* is the sour-wood or sorrel-tree of the southern United States. It is a smooth-barked tree of the heather family, with alternate oval leaves, deciduous and sour in taste. The five-parted cylindrical flowers are in one-sided, slender racemes and in terminal panicles. They have a honey-like odor, and are food for bees. The capsules are pyramidal, five-valved and a soft, pale green in color. The leaves are occasionally used to furnish a black dye, and the wood serves for tool-handles, bearings of machinery and for turning.

SORREL COOL DRINK. See **HIBISCUS**.

SORRENTO (ancient **SURRENTUM**), Italy, in the province of Naples, on the southeast side of the Bay of Naples, seven miles southwest of Castellamare. It is built on the steep mountainous slope of a promontory extending into the bay, in one of the most beautiful and fertile regions of Italy, amid orange, lemon, olive and mulberry groves. A roadway following the coast forms a favorite promenade from the town to Castellamare. Sorrento contains a few interesting ruins of its ancient splendor belonging to the Augustan period. It is the seat of an archbishop and has a cathedral. Other buildings are a seminary and a school of navigation; also a monument to Tasso, who was born here. The wine of Sorrento is famous. The inlaying of wood and silk-culture; the manufacture of silk, cultivation of fruit, stock-raising and fisheries are the chief occupations. It depends, however, mainly upon its attractions as a summer resort, which it owes to a fine climate and picturesque scenery.

SORROWFUL MOTHER, Sisters of the. See **ORDERS, RELIGIOUS**.

SORROWS OF YOUNG WERTHER.

The ('Die Leiden des jungen Werthers'). 'Werther's Leiden,' Goethe's first novel, was written in Frankfort in, 1774, during the so-called storm and stress period. It is divided into two books each consisting of a series of letters by Werther, with some reports by the supposed editor of these letters inserted in the latter half of the second book. The principal character of this novel is a refined, sensitive youth of artistic temperament, who makes imperative demands upon life from a subjective point of view and when disappointed becomes absorbed in himself. This tendency to brood which is dangerous in itself proves fatal in Werther's case on account of his hopeless love. For his endeavor to overcome the latter by leaving Lotte and starting out on a life of activity fails. He falls a victim to his unalterable disposition and the unconquerable power of his passion. Such a "leitmotif" characterizes 'Werther's Leiden' as a genuine product of the storm and stress movement. But this movement was confined to Germany, and the sweeping success of the novel, which called forth translations, imitations and also parodies in all literary languages must be accounted for by other reasons. It appeared in an age of sentimentalism and met the demand for sentimental elements to a considerable degree. Besides, great general problems dealing with man and nature, art and religion are presented in a vigorous style, and the portraits of the persons, especially those of Werther and Lotte, are distinguished by a convincing realism. The most noteworthy of the admirers of Goethe's 'Werther' was Napoleon I.

'Werther's Leiden' is closely connected with the life of its author. During Goethe's stay at Wetzlar, 1772, where the young lawyer was to get practical experience at the Supreme Court of the empire, he met and admired Charlotte Buff who was engaged to a young man, Albert Kestner. There is, however, this fundamental difference between Goethe's life and Werther's: Goethe did not return to Lotte after he had once left her, and while Werther complains about the vanishing of his artistic faculty, it was his very talent that enabled Goethe to overcome his feelings for Charlotte Buff by giving them artistic form. Thus only the first book is really based on Goethe's own experience while the second is based on the tragic fate of his colleague, Jerusalem, who for reasons similar to those of Werther committed suicide. Consult edition of Goethe's works in 'Deutsche National-Literatur' (Vol. XVIII 13, pp. 1-134, 1882-98); Kestner, A., 'Goethe und Werther, Cotta'sche Handbibliothek'; Glöel, Heinrich, 'Goethe's Wetzlarer Zeit' (1911); Long, O. W., 'English and American Imitations of Goethe's Werther' (*Modern Philology*, Vol. XIV, No. 4, August 1916).

EWALD EISERHARDT.

SORSOGON, sör-sō-gōn', Philippines, (1) Pueblo, capital of the province of Sorsogon, Luzon, on Bay of Sorsogon. The bay is 19 miles in length from the town to its entrance and affords one of the best harbors in the Philippine Archipelago. Sorsogon is a port of call for steamers from Manila, and has a considerable export trade, particularly in hemp and copra. In 1840 it suffered from an earthquake

which lasted almost continuously for 35 days; the churches were destroyed, 17 persons were killed and many injured, and the ground for some distance sank five feet below its former level. Pop. about 15,000. (2) Province of the island of Luzon, situated in the extreme southeastern end of the peninsula of Luzon, bounded on the north by the province and the Bay of Albay, and on the south by San Bernardino Strait, length from northwest to southeast 47 miles; greatest width, 40 miles; area, 755 square miles. The coast line is very irregular; on the northwest coast is the deep indentation of the Bay of Sorsogon; and on the northeast coast Sógod Bay, an arm of Albay Gulf; from the extreme northeast shore of the Bay of Sorsogon to the nearest waters of Sógod Bay the distance is but three miles. The mountain system of the province includes a range in the north, forming the boundary line with Albay and another range extending from northeast to southwest, forming the central watershed, but nearer the east coast than the west. In this range is the active volcano of Bulusan, visible for 60 miles at sea. The largest river of the province rises on the western slopes of Bulusan; there are many small tributary streams. There are comparatively few highways, one road connecting Sorsogon with Bacón on the opposite coast. There are several trails, and much coastwise trade in native canoes. The staple products of Sorsogon are hemp and copra (a product of the cocoanut, the form for shipment to be made into oil), and large quantities of both are exported. Native textiles, cordage, etc., are manufactured from the hemp; and the cultivation and manufacture of hemp, and the cultivation of the cocoanut are the principal industries. Sorsogon was formerly a district of the province of Albay, and in 1901 was created a province and placed under civil government in accordance with the provision of the law of the Philippine Commission. Pop. about 130,000.

SORTES, sôr'têz, (Virgilianæ, Homerica, Biblica, etc.), a mode of divination by means of a passage or verse in some poet's works or in the Bible. One way of practising this kind of divination was to open the book at random and to take whatever passage or verse is touched by the finger as an indication of the fortune of the inquirer. Another way was to select a number of verses from a poet or from one of the books of the Bible, write them on slips of paper, mix these in an urn, draw one slip at random and from its contents infer good or evil. The Sibylline oracles (see SIBYL) were also employed in this way. Sortes Virgilianæ are so called, as being practised with verses from the poet Virgil, Homerica from Homer, and so on. In Persia *sortes* are determined by resort to the poems of Hafiz. It is said that the Roman Emperor Severus, who reigned from 193 to 211 A.D., found an intimation of his high destiny in that verse of the Æneid,

Tu regere imperio populos, Romane, memento;

and that the Emperor Gordianus (self-slain after a reign of 36 days) read his doom in this passage of the same poem:

Ostendunt terris hunc tantum fata, nec ultra
Esse sinunt.

Charles I and Lord Falkland tried the *Sortes Virgilianæ* in the Bodleian Library at Oxford and found passages equally ominous to each. The use of the Scripture books for divination still lingers among people of simple faith; and the obstinate survival of this superstition is due to a strong conviction of the power and watchful care of an overruling Providence and a belief in the Bible as an inspired manual of divine guidance: if resort is less often had in these times to the *Sortes Biblicæ*, that may be due to the decaying respect for the mere letter of Scripture.

SOSIOSH, or SAOSHYANT. The promised Messiah of the Soshyantos or fire-priests of the early Iranian religion. A son of the seed of Zarathushtra or Zoroaster, thrice parthenogenetically and miraculously incarnated, he is to be the last of the three great prophets who after 9,000 years are to appear successively at the end of each millennium, until the 12,000 years expire between the creation, the end of the world and the judgment day. See ZOROASTER and related references.

SOTHERN, Edward H., American actor, son of E. A. Sothorn (q.v.): b. New Orleans, 1859. He first appeared with his father in a small part in New York (1879). He starred in 'One of Our Girls' at the Lyceum in New York in 1885. Shortly thereafter he appeared at the head of his own company in such plays as 'Lord Chumley,' 'Maister of Woodbarrow,' 'Prisoner of Zenda,' 'The King's Musketeers,' 'Lovelace,' 'If I were King,' 'The Proud Prince,' and 'Hamlet' (1900). His interpretation of 'Hamlet' is modeled somewhat on that of Edwin Booth, is romantic and effective, but at times prone to exaggeration. In 1904 he began to play Shakespearean rôles with Julia Marlowe, whom he married in 1911. After his wife retired in 1915, he appeared in the 'Two Virtues' and in several revivals. A year later he announced his own retirement. Consult McKay and Wingate, 'Famous American Actors of To-Day' (New York 1896); Strang, 'Famous Actors of the Day in America' (Boston 1900); Sothorn, 'My Remembrances' (*Scribner's Magazine*, New York January 1916 et seq.).

SOTHERN, Edwin Askew, English actor: b. Liverpool, England, 1 April 1826; d. London, 21 Jan. 1881. He was educated for the church, but discovered soon that his inclinations were for the stage. In 1849 he joined a company of strolling players, and soon afterward passed into the stock company of the Theatre Royal, Birmingham. From 1852 he appeared in the United States without attracting much attention until in 1858 'Our American Cousin' was brought out in New York, with Sothorn cast for the small part (47 lines) of Lord Dundreary. Sothorn built up the character, making it the leading feature of the play, and one with which his name has ever since been connected. He acted other parts, with more or less success, and was always popular in America, which he frequently visited. Consult bibliography under Sothorn, E. H.

SOU, soo, an old Roman, Gallic and French coin, of gold, silver and copper. In France the

current five centime piece, 20 of which make a franc, are commonly called sous.

SOUARI, or SUWARRO, NUTS, the seeds of the genus *Caryocar* (family *Caryocaraceæ*), lofty trees yielding timber prized for its durability and common in British Guiana. *C. nuciferum* is the chief source of supply of these nuts, having digitate leaves, five- or six-parted, large, magenta-colored flowers and a fruit which is a spherical, hard, woody shell, as large as a child's head, reddish-brown in color and covered with roundish protuberances. It contains four seeds, the souari nuts, which are kidney-shaped, about the size of an egg, with a ruddy brown shell, that is very hard but has a satiny lining and encloses a soft, pure white kernel in a brown skin. This rich meat, with its sweet, almond-like flavor, is considered to be the finest of all nuts. A bland oil is expressed from the kernels and they are called butter-nuts in the English market, or cream-nuts in the American. Since there is great difficulty in gathering them, on account of the bulk of the trees, the supply is restricted.

SOUBISE, soo-bêz, Benjamin de Rohan, SEIGNEUR DE, French Huguenot soldier: b. Rochelle, France, 1583. He was a son of René II, Vicomte Rohan, and a younger brother of the soldier-writer, Henri de Rohan. He served his apprenticeship as a soldier under Maurice of Orange and when the religious wars broke out in 1621 was entrusted with the chief command of the west, while his brother commanded the land forces in the south. In 1625 Soubise made a daring attack on the royalist fleet in the river Balvet and occupied the island of Oleron. He also commanded in the defense of Rochelle, but was unable to save the town and when it fell he fled to England.

SOUDAN, soo-dôn'. See SUDAN.

SOUFFLÉ, soo-flâ', a dish consisting chiefly of the whites of eggs, to which other ingredients (chocolate, cheese, vanilla, orange-flower water, rose water, various essences, etc.) are added, to give consistency, flavor and variety. The materials have to be agitated with a whisk until the whole is in a creamy froth, which is then baked in a soufflé pan.

SOUFFRIÈRE, La, lâ soo-fré-âr. See SAINT VINCENT.

SOUL, in philosophy the basis of the unity of individual consciousness and conduct. The opinions held as to the nature of this basis have naturally varied in accordance with the current views as to unity and explanation. The savage, for example, can find no principle of explanation that is not at once a tangible object and the bearer of human attributes, so that in his eyes the soul becomes a homunculus, a man within the man. The transition from the view of the savage to that of the uneducated man in a civilized community consists at most in the discardance of the grosser material attributes of the soul, without the loss of any of its anthropomorphic qualities. It requires a certain degree of philosophical sophistication to become aware that any explanation of the soul which is to convey real knowledge must not involve the equally complicated notion of a person. The first explanations of the soul which are to be found in Greek philosophy resemble all the explanations of their period in that they

make use of a material principle. This material principle, which is the magnet in the philosophy of Thales, air in that of Anaximenes, fire in that of Heraclitus and the finer atoms among the Atomists, is considered to be a moving force. Anaxagoras made the first great advance in the theory of the soul by isolating the notion of moving force from that of a particular material substance. The Pythagoreans adopted a view which may be regarded as an anticipation of Aristotle, in that they held the soul to be the harmony of the body. In this pre-Socratic period all the accounts of the soul place a preponderant emphasis on its cognitive nature.

It is only with Plato that the nature of the soul comes to be the cardinal problem of philosophy. He assigns to it a place intermediate between not-being and the realm of Ideas. The world-soul is the harmony of "sameness," that is universality such as pertains to the Ideas and "otherness," or the particularity characteristic of the things of sense. The soul of the individual is a less perfect copy of the soul of the universe. The soul is immortal and uncreated and the universals of our knowledge are but the recollection of what we have learned in a previous life. The soul cannot be destroyed, for it partakes in the idea of life itself. The body is the prison of the soul and prevents it from returning to its home in the realm of Ideas. Each soul contains three parts—a desiderative, a spirited and a rational. That soul in which the rational preponderates will resume that life of which all souls originally partook—the blessed life of a star.

The Aristotelian view of the soul is peculiarly interesting in that it involves motives which are active in the philosophy of the present day. He places the soul definitely in that category of being corresponding to the Platonic Ideas—the realm of pure forms. The soul is the formal cause of the human body and since the body is an organism, the soul is also the final and efficient cause. In Aristotle's own language, the soul is the entelechy of the body. Like the Platonic soul, the Aristotelian soul is tripartite. It contains a vegetative part, which superintends the functions of assimilation and propagation and constitutes the entire soul of plants; an animal soul, characterized by the powers of locomotion and sensation, which supplements the vegetative soul throughout the animal kingdom and a rational soul, found only in man. The principle of unity connecting these three faculties is not explained. The question of the oneness of personality is complicated by the notion of the soul as an immaterial principle. Aristotle denies immortality to the soul, which he conceives to be created like the body in the act of begetting.

The Stoic psychology is essentially materialistic. The soul is nothing but fire or breath uniting the body much as the world-soul of fire unites the world. The soul consists of reason, the power of reproduction, speech and the five senses. Personal identity resides in the reason, but the individual soul is a part of the world-soul. The soul exists after death, though not for an eternity. Epicureanism took over bodily the psychological theory of atomism. The soul, according to the Epicureans, is made up of the finest fire-like atoms, the movements of which are sensation and thought.

Immortality is completely denied. Lucretius distinguishes two levels of psychical life; the lower, animal *anima*, and the higher *animus*, presiding over emotion and cognition. The Neo-Platonists consider intelligence, soul and matter as successive emanations from the One-Soul, is consequently prior to body, and more real than it. This opinion is in the philosophy of the Gnostics combined with the tripartite division of human nature characteristic of the older Platonism. In place of the desiderative part of man, according to the Platonic philosophy, they put the body; in place of the spirited part, the soul; in place of the intellectual part, the spirit. Corresponding to the ethical and religious trend of Gnosticism, the highest place is no longer given to reason, but to that new element which enters into the human soul upon conversion. In the later Christian philosophy, the "soul" and "spirit" are fused into a single entity. In Saint Augustine there are found many of the motives which characterize later mediæval and modern philosophy. The body-soul dualism based on the distinction between thought and extension appears in his philosophy as well as in that of Descartes. He retains the Aristotelian notion of the soul as final cause and disclaims all knowledge of the origin of the soul.

The Scholastic doctrine of the soul is essentially Aristotelian. In the form held by Saint Thomas and now the official philosophy of the Catholic Church, it consists of the following dogmas: (1) the soul, which is not divided after the fashion indicated by Aristotle, is the form of the body; (2) it is a substance, but is incomplete in the sense that it has a natural fitness for association with a body; (3) it is spiritual and without extension; (4) it is created at a definite moment in the development of the organism. Of course, the scholastics all maintained the immortality of the soul.

The modern period of philosophical thought is marked by a very important change in the notion of the soul, as has been shown. The scholastic philosophy perpetuated the Aristotelian concept of the soul as form or entelechy. While it is true that the scholastics regarded the soul as a substance, they considered it, not as merely coequal with matter, but as the organizing factor in the soul-matter complex which constitutes man. The body was thus in a sense subordinated to the soul. On the other hand, in the philosophy of Descartes, soul and body are co-ordinated as respectively the thinking and the extended substances. As a substance is that which possesses attributes, it is quite a different sort of thing from the Aristotelian form, which gives to matter its attributes. The soul substance is of course differentiated into individual souls; but of the nature of this differentiation Descartes says little or nothing. The existence of my individual soul is guaranteed to me by the famous principle, "I think, therefore I am."

After the Cartesian dialectic has established the existence of God and the material universe, the next problem is the correlation of the experiencing soul and the material objects of its experience. This correlation, which according to Descartes is guaranteed by the perfect honesty of God, is supposed to take place in the pineal gland. The Occasionalists go beyond Descartes in that they make the correlation

between the soul and the matter depend on the act of God in each particular case. The culmination of this trend of thought is to be found in Spinoza, who maintains that mind and matter are not separate substances at all, but merely two among the infinite number of attributes of the Divine Substance. Another offshoot of Occasionalism is the philosophy of Leibnitz. Instead of a dualism of mind and matter, his philosophy is a pluralism of different soul-substances, which in confused perception may give the appearance of matter. The correlation between the content of an individual soul and the universe which this content represents is established through an act of God which has pre-established the harmony of the universe. Unlike the continuous divine intervention of Occasionalism, this act was finished once for all at the creation of the universe.

The rationalistic school of the Continent, as has been shown, ended, so far as the concept of soul is concerned, just about where it began. For Descartes, the Occasionalists, and Leibnitz, the soul is essentially substance; and even for Spinoza, it is a divine attribute possessing much of the autonomy of a Cartesian substance. Like the rationalists, the British empiricists began with a substantial notion of the soul, but unlike the rationalists, they carried the notion to its absurd logical conclusion and transcended it. Locke considered the soul after the fashion of Descartes, as a substance, as the substratum of ideas. He made it a blank tablet on which the ideas are impressed, but beyond this he did not characterize it. Though he was sure that self-consciousness exists, he made no psychological investigation into its nature. Berkeley for all his incisive criticism of the Lockean notion of substance in its application to the material world, left the notion of soul untouched. It remained for Hume to do for mind what Berkeley had done for matter and to point out the fact that introspection alone was unable to reveal a specific soul-entity. Putting this fact side by side with the inability of the notion of a substratum to give a real explanation of anything, he came to the conclusion that the mind is neither more nor less than the sum total of its states.

Kant, who was awakened by Hume from his "dogmatic slumber," was not the least under his influence in the matter of the soul. While he most emphatically asserts that a soul exists, he denies that it is immediately accessible to perception. He points out, in the course of his discussion of the paralogisms of rational psychology, that the aprioristic Wolffian psychology is based on a confusion between the subject, which must exist in some sense or other in every act of consciousness, and the simple, lasting, personal soul. The soul, *qua* substance, is inaccessible to us, and the entire worth of a dialectical discussion of psychological matters lies in the criticism to which it subjects such theories of the soul as materialism or the opinion that we have a direct intellectual acquaintance with a permanent, personal ego. Thus all metaphysical proof of immortality falls to the ground, as likewise does all metaphysical disproof. The immortality of the soul, however, is established as a postulate of the pure practical reason — of the reason as applied to affairs of conduct. The existence of morality requires that there should be a

progress in *infinitem* of the imperfect human will toward the perfection enjoined by the moral law. Kant's attitude towards the soul may be summed up in the statement that the soul can only be thought by the pure reason, but may be known by the practical reason. This ability of the practical reason to grasp matters that are partly veiled to the pure reason is known by Kant as the primacy of the practical reason. The Kantian primacy of the practical reason is repeated in the philosophy of the romanticists under the form of voluntarism. Fichte and Schopenhauer both emphasize the part played by the will in the constitution of the soul. The ego, which is the basis of the entire Fichtean philosophy, is grasped in a voluntary act of intellectual intuition, which exhibits to us the law of duty. The ego is immediately aware of its own free act. For Schopenhauer, as later for Bergson, the intellect is but a schematization of the will, which constitutes the true nature of the human being as well as of the universe. Hegel agrees with the Kantian refutation of rational psychology, but regards the Kantian antinomies constituting Kant's refutation merely as a few of an indefinite number of antinomies having their roots in Being itself. Herbart makes the soul one of his undefined primitive concepts. It is simple, absolute and transcends the bounds of space and time. Its only activity is self-preservation and ideas arise when it acts to preserve itself in opposition to another real. Lotze considers that the soul and body interact and that mind is but the higher, explicit development of what is found in the grossest matter. The philosophy of Fechner is likewise a panpsychism (*q.v.*) which makes the entire universe consist in a hierarchy of souls subordinated to the world-soul of God, whose body is Nature.

Among the more interesting of the current views concerning the nature of the soul is that which assimilates the soul to the phenomena of life in general. While this is the tendency of all vitalists, it reaches the highest degree of metaphysical development in the philosophy of Henri Bergson. Bergson's philosophy is based on the contrast between two aspects of the universe: between the immediately given living time and the atomic space, known only through the analytic powers of the intelligence. The temporal aspect of the universe is identified with the spiritual force of life. Accordingly the true nature of the self is inaccessible to the formal, deadening intellect and can be grasped only through intuition. In this aspect, as grasped by intuition, it transcends all individuation and personality. It is the same living force which exemplifies itself throughout all nature. Only through the damming of the stream of life by matter does the individual soul arise with its concomitant body. Empirical psychology is of itself unable to transcend the individual soul and see the greater reality that lies behind. The Bergsonian philosophy, that is, points out the limitations of a rational account of the soul and indicates a superrational mode of approach — psychology. As Bergsonianism treats of matters which it claims are not properly subject to the reason, it is clear that it claims for itself an intuitive basis. Whether the Bergsonian intuition exists or not is a sheer question of fact; it is

certain at any rate that there are many who do not feel an intuitive compulsion to accept Bergson's view of the soul.

At present there is a strong tendency to return to what is in a sense the Humian view of the soul. James and the American school of Neo-Realism (see **REALISM**) agree to the extent that they consider the soul as the stream of its states and maintain that these states, in a different context and arrangement, form the subject matter of the physical science. This view, similar as it is to that of Hume, marks at once a great advance over that of Hume and a partial revival of Aristotelianism. The stream of states is not a mere fortuitous aggregate of experiences; A's experiences and B's experiences are each united in a manner totally different from the manner in which some of A's experiences can be united to some of B's. In other words, this theory, which calls itself neutral monism, makes the soul consist, not merely of certain states which are aggregated, but of a system of states-in-a-peculiar-mode-of-aggregation. The distinction between these alternatives was inadmissible for Hume because of his nominalism. On the other hand it may be expressed in Aristotelian languages by calling the mode of aggregation the entelechy of the stream of states. Like Aristotelianism, neutral monism finds the unity of consciousness in the embodiment of a form or structure or relation, but unlike Aristotelianism, it maintains that the matter shaped by this form is not the body, but the stream of consciousness itself.

Neutral monism has recently been subjected to a keen and unfavorable criticism by Bertrand Russell. His objections are (1) that introspection shows that knowledge does not consist in the entry of an experience into a system of experiences, but in a direct relation to a mind or soul; (2) that neutral monism cannot account for the relation of belief; (3) that the thought of a timeless thing is in time, so that the thing and the thought cannot differ merely in their context; (4) that neutral monism is adapted to explain rather the knowledge of things than that of facts; (5) that there are "emphatic particulars" such as "this" and "I" and "now." It is possible, however, to modify neutral monism so as to avoid much of the force of these objections. To begin with objection (3), it is not essential for neutral monism to maintain that every experience is identical with its object. This much of nominalism is valid, that in much of our thinking, the ultimate objects are supplanted by their symbols. There is nothing controverting the principles of neutral monism in the supposition that in a certain context one experience datum may acquire a vicarious interpretation as another. (See **MEANING**; **THOUGHT**). Neither is it in any way impossible or unlikely that the timeless should be presented to us directly. Putting these two possibilities together it is clear that the thought of a timeless thing may be in time just by virtue of the fact that the situation in which the timeless thing occurs is symbolized by a complex of similar structure, but consisting of temporal entities. Belief is also explained by the self-representative character of experience. A belief is a situation where a complex of experiences plays the part of a symbol complex toward another complex with the structure

of which it has not been definitely compared. As to neutral monism and the knowledge of facts, there is no reason why experience should not contain fact-states as well as thing-states. Immediate acquaintance with facts offers no difficulties, while descriptive knowledge is merely such knowledge as is mediated by a symbolism. The objection that introspection conflicts with neutral monism is certainly not conclusive, as introspection is no more infallible than other varieties of observation. The Russellian resolution of a table into an aggregate of aspects or empirical data calls for a philosophical sophistication which should not be appalled by the apparently unitary character of the soul. Finally, the distinction between the focus and periphery of attention may be taken as a fact without the assumption of any soul-entity behind it, yet it is quite sufficient to account for the existence of emphatic particulars. See **DUALISM**; **IDEALISM**; **MONISM**; **PSYCHOLOGY**; **REALISM**.

W., *'On the Nature of Acquaintance'* (*The Monist*, Vol. XXIV, Nos. 1-3, Chicago 1914).

NORBERT WIENER.

SOULE, soo-lă', Gideon Lane, American educator: b. Freeport, Me., 25 July 1796; d. Exeter, N. H., 28 May 1879. He was a student at Philips Exeter Academy in 1813-16 and was graduated at Bowdoin College in 1818. He was afterward for more than 50 years connected with the Phillips Exeter Academy, of which he was principal in 1838-73. He was chiefly responsible for the great success of the institution.

SOULE, Joshua, Methodist Episcopal Church South, bishop: b. Bristol, Me., 1 Aug. 1781; d. Nashville, Tenn., 6 March 1867. He began his career as a "boy preacher" at 17, studied indefatigably and acquired a reputation as an opponent of Calvinism, Unitarianism and Universalism. He became presiding elder of the State of Maine in 1804, when but 23; and served on the committee which drafted the constitution of the church in 1813. He became bishop in 1824, and upon the division of the church in 1845 he went with the Methodist Church South, becoming its senior bishop. He was a man of wide influence. He retired at 72. Consult Dubose, H. M., *'Life of Joshua Soule'* (1911).

SOULÉ, Pierre, American statesman: b. Castillon, France, September 1802; d. New Orleans, La., 26 March 1870. He received most of his education at Toulouse, having been interrupted in his studies at Bordeaux by an accusation of complicity in a plot against Louis XVIII, in consequence of which he was obliged to flee. Soon after his pardon in 1824 he was again exiled on account of the publication of articles in his paper *The Yellow Dwarf*, derogatory to the course of the ministers of Charles X, and took up his residence at this time in America. A few years later he was elected to the United States

Senate from Louisiana, and was still later entrusted with the negotiations of the United States government with Spain for the purchase of Cuba. During the Civil War he was a member of Beauregard's staff. At the conclusion of hostilities he took up his law practice in New Orleans.

SOULT, soolt, **Nicolas-Jean de Dieu**, marshal of France: b. Saint-Amans-la-Bastide, department of Farn, 29 March 1769; d. Soultberg, 26 Nov. 1851. He entered the army as a common soldier, but was soon distinguished for gallant conduct and raised from the ranks. In the campaign of the upper Rhine in 1792-94 he was brevetted general of brigade, and in 1799 was made general of division and served with distinction as such under Massena in Switzerland and Italy. He became an ardent champion of Napoleon by whom he was appointed marshal at the beginning of the Empire (1804). His military genius was further proven at Austerlitz, where he decided the battle by cutting in two the main body of the Russian troops, and in numerous other battles, the most conspicuous being that of Friedland in the Prussian campaign in 1807. Upon the fall of Napoleon he was appointed Minister of War by Louis XVIII, but was compelled to resign by the royalist party. He acted as major-general of the army at Waterloo, but was obliged to flee from France at the second Bourbon restoration. Returning in 1819, he was again appointed Minister of War, and in 1839 Minister of Foreign Affairs. In 1846 he was created grand-marshal of France, and retired to private life. He was created a peer of France and under Louis Philippe was a prominent official. Consult Soult, 'Mémoires' (3 vols., Paris 1854); Thiers, 'History of the Revolution and the Empire'; and Salle, 'The Political Life of Marshal Soult' (1834); Dumas, J. B., 'Neuf mois de campagne à la suite du maréchal Soult' (Paris 1907).

SOUND. See ACOUSTICS; VIBRATION.

SOUND, The, or **OERESUND**, é'rä-soond, Denmark, the easternmost of the three channels which connect the Kattegat with the Baltic Sea. It separates the Danish island of Zealand from the southern extremity of Sweden. Its length is about 30 miles, and its breadth varies from less than three miles at the northern end, between Elsinore and Helsingborg, to 16 miles between Copenhagen and Malmö. Its depth varies from four to 20 fathoms. Since the opening of the Kaiser Wilhelm Canal the Sound has lost some of its importance, but is still navigated by numerous vessels. Sound duties were formerly levied by Denmark on all ships passing through it, but these were abolished in 1857.

SOUNDINGS, the operation of trying the depth of deep water and the quality of the bottom, especially by means of a plummet sunk from a ship. In navigation two plummets are used, one called the hand lead, weighing about eight or nine pounds, and the other, the deep-sea lead, weighing from 25 to 30 pounds. (See LEAD). The former is used in shallow waters, and the latter at a distance from shore. The nature of the bottom is commonly ascertained by using a piece of tallow stuck upon the base of the deep-sea lead, and thus bringing up sand,

shells, ooze, etc., which adhere to it. The scientific investigation of the ocean and its bottom has rendered more perfect sounding apparatus necessary, and has led to the invention of various contrivances for this purpose. See OCEAN.

SOURLAKE, or **SOUR LAKE**, Texas, city in Hardin County, about 20 miles northwest of Beaumont, in an agricultural region and a section rich in oil. For several years Sourlake was a health resort, taking its name from springs which possessed medicinal properties. In 1902-03 prospectors began to sink oil test-wells in the pine forests around the springs, with the result that oil in large quantities was found. So many derricks were erected in rows so closely together, that one portion of the oil-field was called the "Shoestring district." Sourlake was at once connected with Beaumont and Port Arthur by pipe lines until such time as its own storage buildings were ready for use. Considerable of the oil is sent direct to refineries. The first part of the year 1902, Sourlake was a stretch of prairie at the edge of a pine forest; 1903 saw it a village of about 200 inhabitants with some visitors to the springs. The census of 1910 gave the population as 4,900.

SOURSOP, the edible fruit of *Annona muricata*, a small, much-branched, ornamental tree, cultivated in the East and West Indies. This fruit is large, pear-shaped, covered with soft prickles, greenish outside, but containing a white succulent pulp, with an odor suggesting black currants, and a peculiar, but pleasant, sub-acid taste.

SOUSA, John Philip, American conductor, composer and author: b. Washington, D. C., 6 Nov. 1854, son of Antonio and Elizabeth Sousa. At the age of 11 he first appeared in public as violin soloist; at 15 he was teaching harmony; in 1876 he became one of the first violinists in the orchestra conducted by Offenbach when the latter visited America; later he became conductor for various theatrical and operatic companies. In 1880 he was appointed leader of the band of the United States Marine Corps in Washington, serving under Presidents Hayes, Garfield, Arthur, Cleveland and Harrison until 1 Aug. 1892, when he resigned from the United States service to organize the Sousa Band, which has since then made 38 semi-annual tours throughout America, and has visited Europe five times, giving a total of more than 10,000 concerts in 1,000 cities, and covering over 700,000 miles of travel. In 1910, beginning in New York on 6 November, he inaugurated a tour of the world, and visited with his band, Europe, Canary Islands, Africa, Tasmania, Australia, New Zealand, Fiji Islands, Hawaiian Islands, British Columbia and toured across the Continent back to New York, returning after 14 months' travel. Since his band was organized, he has appeared at the most prominent of the great expositions in this country and in Europe, the last and most important being the Panama-Pacific International Exposition in 1915 in San Francisco. As composer of music he established a "march style" of his own which has been recognized the world over, and he has been called the "March King" in every country. Some of the best known and most popular of

his productions in this field are 'The Washington Post,' 'High School Cadets,' 'Liberty Bell,' 'Manhattan Beach,' 'Semper Fidelis,' 'The Gladiator,' 'The Stars and Stripes Forever,' 'Invincible Eagle,' 'Hail to the Spirit of Liberty,' 'Hands Across the Sea,' 'The Charlatan,' 'The Bride-Elect,' 'El Capitan,' 'King Cotton,' 'Imperial Edward,' 'Jack Tar,' 'The Diplomat,' 'The Free Lance,' 'The Fairest of the Fair,' 'The Federal,' 'From Maine to Oregon,' 'The Lambs,' 'The Pathfinder of Panama,' 'The New York Hippodrome,' etc. He has also written several Suites, including, 'Three Quotations,' 'Looking Upwards,' 'Maidens Three,' 'At the King's Court,' 'Last Days of Pompeii,' 'Dwellers in the Western World,' 'People Who Live in Glass Houses,' 'Tales of a Traveler,' 'The American Maid' and 'Impressions at the Movies.' Also, an historical scene, 'Sheridan's Ride,' and a symphonic poem, 'The Chariot Race.' He has composed a long list of songs and miscellaneous pieces, and a number of light operas, some of the latter being 'The Smugglers,' 'Desiree,' 'The Queen of Hearts,' 'El Capitan,' 'The Bride-Elect,' 'The Charlatan,' 'Chris and the Wonderful Lamp,' 'The Free Lance' and 'The American Maid.' As author, he compiled under the auspices of the United States government, 'National, Patriotic and Typical Airs of all Countries,' wrote the book and lyrics for the opera, 'The Bride-Elect,' also numerous magazine articles and verses; and has produced two novels, 'The Fifth String' and 'Pipetown Sandy.' With his band he has appeared twice, by command, before King Edward and Queen Alexandra of England, once at Sandringham, and then at Windsor. On the first occasion he was honored by His Majesty with the decoration of the Victorian Order. He has also received the Grand Diploma of Honor of the Academy of Heineault, Belgium, and has been decorated by the French government with the Palms of Académie, besides making him an Officer of Public Instruction.

SOUSA, sô'zā, or SOUZA, Martin Alfonso de, Portuguese colonist and governor in South America: b. Bragança, about 1500; d. Lisbon, 21 July 1564. In 1530 Sousa, an army officer, was dispatched in command of a fleet of five sail with a force of 500 to colonize Brazil. The commonly-received statement is that he discovered the bay which is supposed to be the mouth of a river and named Rio de Janeiro, 1 Jan. 1531. But there is some doubt as to whether he was in the bay on that date, and there are records of earlier visits by others. On 22 Jan. 1532 he founded at São Vicente the first Portuguese colony in Brazil. There he introduced the sugarcane, which he had brought from Madraia, and built the first sugarmill in the country. In 1533 he was recalled, and in 1534 made captain of São Vicente, whose affairs he continued to administer, though he did not again visit it. He was admiral of the seas of India in 1534-40, and governor of the Portuguese East Indies in 1542-45.

SOUTANE', a close-fitting long coat reaching to the ankles, which is the distinctive dress of clerics in the Roman Church. See **CASSOCK**; **COSTUME, ECCLESIASTICAL.**

VOL. 25—18

SOUTH, Sir James, English astronomer: b. London, October 1785; d. there, 19 Oct. 1867. He was educated as a surgeon and gave up a large practice in London to pursue the study of astronomy. In 1816 he fitted up a private observatory at his home, and devoted all of his time to astronomical investigation. He was the discoverer with Sir John Frederick William Herschel of 380 double stars, which were catalogued by them in 1833. In 1835 he removed his telescope to France, where he made other important observations. He was knighted for his services in behalf of science in 1830. He was the first president of the Astronomical Society, of which he was also a founder. Among his important observations were Encke's comet (1828 and 1838); Mauvais' comet (1844), and Vico's (1845).

SOUTH, Robert, English Anglican divine: b. Hackney, 4 Sept. 1634; d. Westminster, 8 July 1716. He was educated at Oxford and after traveling on the Continent took orders in the Church of England in 1658. He was university orator 1660-77, became prebendary of Westminster in 1663, in 1667 was made chaplain to the Duke of York, and in 1670 was appointed canon of Christ Church. In 1676 he accompanied Lawrence Hyde, afterward Earl of Rochester, who went as Ambassador to Poland, and on his return was appointed rector of Islip, Oxfordshire. South's hatred of Roman Catholics was as strong as his contempt for Puritans. He hesitated for some time at the event of the Revolution over the matter of his allegiance but finally adopted the parliamentary fiction that the flight of James was in effect an abdication. In 1693 he entered upon his great controversy with Sherlock, dean of Saint Paul's, occasioned by the latter's 'Vindication of the Doctrine of the Trinity' which South answered by his anonymous 'Animadversions,' full of learning and incisive logic as well as fierce sarcasm and petty personalities. To Sherlock's 'Defense' South published a rejoinder, 'Tritheism charged upon Dr. Sherlock's new notion of the Trinity'; and the controversy became the talk and ridicule of the town until the king himself intervened. In 1713 he refused the see of Rochester and the deanery of Westminster. His sermons are masterpieces of clear thought, direct and vigorous in English, sometimes rising to eloquence, often spiced with a wit and sarcasm unusual in pulpit utterances, and straining at times the bounds of propriety. His sermons were published by himself in 1679-1715; an additional volume in 1717 contained his 'Memoirs' and the account of the Polish travels. Modern editions were published in 1823, 1842, 1843, 1845, with the 'Memoir,' and 1850.

SOUTH AFRICA, an ambiguous geographical term embracing (a) only British South Africa, or (b) British South Africa plus Portuguese East Africa and that territory formerly known as German South-West Africa. Although the term is generally applied to that part of the continent south of the Zambesi, below the 14th degree of southern longitude, a portion of British South Africa, viz., North-East Rhodesia, reaches eight degrees further north, to Lake Tanganyika. If we accept that boundary line as the extreme northern limit,

then South Africa would include not only the whole of Portuguese East Africa and a third of German East Africa, but also entire German South-West Africa and three-fourths of Angola. Officially, however, the British territory north of the Zambesi is styled British Central Africa. Leaving out Portuguese possessions, for which see PORTUGAL; and the former German territories, for which see SOUTH-WEST AFRICA and EAST AFRICA, there remains the subject of this article, British South Africa.

This great territory comprises the Union of South Africa (q.v.), composed by the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, Rhodesia and Northern Rhodesia, the Bechuanaland Protectorate, Swaziland and the native territory of Basutoland. All these will be found under separate heads. Together with Walfish Bay (430 square miles), the area of British South Africa is 1,205,357 square miles, with a population at the last census of 8,102,861, being approximately 1,310,027 whites, 6,610,535 natives and 182,299 Asiatics. Geographically it lies between 8° and 35° south, and 12° and 36° east. The Belgian Kongo and former German East Africa bound it on the north, the Nyasaland Protectorate and Portuguese East Africa on the east, Angola (Portuguese) and German South-West Africa, now called the South-West Africa Protectorate, on the west. The extreme length, from the Kongo border to Cape Agulhas, is close on 2,000 miles; greatest breadth, 900 miles. Only Cape Colony and Natal border on the coast, washed in the west by the Atlantic Ocean, and in the south and east by the Indian Ocean. The total coastline of Cape Colony, from the Orange to the Umzimkulu estuaries, is roughly 1,300 miles; that of Natal, about 380 miles. Prominent headlands along the coast are Cape Castle, Cape of Good Hope, Danger Point, Cape Agulhas, Cape Saint Francis and Cape Recife, enclosing a number of inlets or exposed roadsteads—Table Bay, Saint Helena Bay, False Bay, Plettenbergs Bay, Mossel Bay, Saldanha Bay and Algoa Bay. For the most part the coastline is low-lying and inhospitable; the harbors are mostly unprotected and the river-mouths are choked by sand-bars. Behind the seaboard rise ramparts of hills shutting off the interior. In places the mountains, which run parallel to the coast, run down close to the sea, as at Table Bay (3,582 feet high). The highest points are in the southeast, on the Drakensberg, which in places rises to a height of 10,600 feet. The various ranges almost form a succession of steps leading to the great table-land of the interior. The Transvaal is practically a large plateau from 4,000 to 6,000 feet above sea-level. The High Veld, the highest part of the Transvaal Province has consequently a healthy and bracing climate. A large part of the interior plateau, of which the northern part includes Rhodesia and Nyasaland, is flat or only diversified by worn remnants of hills. The great Kalahari Desert and other extensive areas are largely or wholly semi-desert or "Karoo," while the most fertile regions lie on the southern and eastern coastlands. With little interruption a similar terraced formation extends throughout the south-

eastern region between Kafirland and the Limpopo. The Lobombo Mountains, a single chain of about 3,000 feet, traverse Zululand, Swaziland and the Transvaal, while the inner and higher escarpments, sweeping round the extremity of the continent from the Orange estuary to the Limpopo, are here continued beyond the Stormberg as the Randberg or Drakenberg range, and reach an altitude up to 10,000 feet. On the outer slope, falling seaward through a series of terraces, lie Natal and Zululand. The nucleus of these highlands is formed by the Antelope or Potong Mountain at the converging point of Basutoland, Natal and the Orange River Free State, and constitutes the main divide between the waters flowing west to the Orange Basin and east to the Indian Ocean. From here the Drakenberg turns northward and culminates in the highest point of the Transvaal, the Mauchberg, 8,730 feet high. The surface of the Orange Free State is mostly level or gently undulating, with some ridges of hills and numerous isolated, generally flat-topped, eminences called "kopjes," rarely more than 500 to 700 feet high, though the whole plateau is from 4,000 to 5,000 feet above sea-level. Immediately north of the Transvaal lies Southern Rhodesia, separated by the Limpopo River, and extending northward to the Zambesi. An elevated region runs through this territory from the source of the Shashi on the west, in a northeasterly direction to the source of the Manyami River, and thence southeasterly to the sources of the Pungwe and Odyi. The watershed between the Zambesi and Limpopo drainage areas runs along this elevated backbone in the central and western portions, and between the Zambesi and Sabi farther east. The most famous landmarks of Rhodesia are the great Victoria Falls and the Matoppos Hills, where the founder of the country, Cecil Rhodes, is buried.

The drainage of South Africa is effected by the Orange River flowing into the Atlantic, the Zambesi, Limpopo and other streams into the Indian Ocean, as well as numerous small streams. Owing to the steep fall, and the intermittent supply of rain, only the Zambesi is at all available for navigation. That river, which forms a great delta on the coast of Portuguese East Africa, divides Southern Rhodesia from British Central Africa. It is navigable by steamers of light draught from its mouth for 300 miles to the Kebra Basa rapids above Tete; a steamer placed on the river above those rapids has reached the mouth of the Gwai, 600 miles farther and from this point onwards a succession of rapids and two large waterfalls make the river unnavigable for any long distance without a break. The drainage basin of the Orange River is the whole country south of the Witwatersrand enclosed by the escarpment, excepting a small area in Calvinia and Namaqualand. The main stream of that river, which is swelled by many tributaries, rises in the Basuto highlands, and on the coast side of the range countless rivers and torrents struggle through the mountain defiles during the rainy season. But during the greater part of the year when there is no rain many of these rivers are only dry beds. The Vaal River, like the Orange, is not

navigable, but has a more varied course, traversing the hilly country made of pre-Karoo rocks around Parys and Venterskroon, and for a distance of over 230 miles it occupies, together with its affluent the Hart's River and the Orange River, the course of an ancient pre-Karoo valley (Kaap), from Vryburg to Prieska. The Limpopo receives the drainage of the northern and middle Transvaal either by gorges cut back through the escarpment or, higher up its course, by the Magalakwin, Crocodile and other rivers which flow northward, describing a semi-circle of nearly 1,000 miles between its source below Pretoria and its mouth above Delagoa Bay.

Climate.—The plateau configuration of the country has the effect of maintaining the climate of South Africa with remarkable uniformity. Thus, Salisbury, in Rhodesia, though within the tropics and 16° nearer the equator, has a mean annual temperature only 2° higher than Cape Town, while the Mossel Bay has practically the same annual temperature as Pretoria and Pietersburg, respectively some $8\frac{1}{2}^{\circ}$ and $10\frac{1}{4}^{\circ}$ farther north. The mean range between Cape Town and Salisbury is 62.6° and 64.6° Fahrenheit. The mean daily range increases from the coast inwards, averaging slightly over 12° F. at the south coast stations and increasing to over 30° F. in Basutoland and parts of the High Veld, where, however, it is mostly between 26° and 28° . The seasons are the reverse of those in the northern hemisphere, the three warmest months, December–February; the maximum or day temperatures are highest (82.2° F.) in January, and decrease to the lowest (66.3° F.) in June, after which they rise again. The minimum or night temperature curve falls from its highest value (59.1° F.) in February to its lowest point (39.4° F.) in July. The rainfall varies enormously, ranging from over 200 inches in the mountainous district of the southwest of the Cape Province to 2.5 inches at Port Nolloth, and 0.3 at Walfish Bay. In the east of the province the normal annual rainfall is about 62 inches.

Aborigines.—The native races are (1) the yellow-skinned Bushmen and Hottentots, and (2) the various branches of the dark-skinned Bantu. Up to the end of the 18th century the two former races constituted the "native" population, but these are now practically extinct, as separate races, while the Hottentot stock has contributed largely to the population of mixed European and African blood known officially as "colored persons." The Bantus, after more than a century of wars, have been brought with varying completeness under the control of European officials, and having benefited physically by a modified European system of government, now show a rate of increase slightly higher than that of the European population.

White Peoples.—The original stock of the Boer or Dutch Afrikaner people contained a considerable mixture of French blood. The foundation of the predominant white population was laid almost exclusively between 1652 and 1690. The 1687 census showed 573 Europeans, exclusive of the officials and servants of the Dutch East India Company. Immigration records show that the main elements of this

parent stock were: (1) the discharged soldiers, sailors and other servants of the company who formed the original settlement in 1657; (2) parties of young women from the public orphanages of Holland, sent out by the company in 1685; (3) a community of Huguenot refugees; and (4) a number of Dutch families. The company took drastic measures from the first to prevent the Huguenots from establishing a separate nationality, and by the middle of the 18th century the French language was forgotten and the refugees incorporated into the Dutch majority, speaking the broken Dutch *patois* known as the *Taal*. With the advent of British rule in 1806 arrived an influx of British officials, soldiers, merchants and missionaries, followed, in 1820, by some 5,000 British immigrants. During the next 50 years many thousands more were poured into the country, and English became the current language over wide areas. Over 2,000 men of the Anglo-German Legion were settled in British Kaffraria; other emigrants came also from central and eastern Europe, and Italy. After the close of the South African War (q.v.) some 2,000 British agricultural settlers were established side by side with the Boer farmers, and employment was found for 3,500 young women, mainly domestic servants, sent from Great Britain by the joint efforts of the government and private organizations.

Religion.—The Dutch Reformed Church and the Third Afrikanse Gereformeerde Kerk have the largest European membership (700,000 in 1911), the Church of England coming second with some 260,000. Next in strength are the Wesleyans, Presbyterians, Baptists, Congregationalists, Roman Catholics, Lutherans and Jews.

SOUTH AFRICA COMPANY, British.
See BRITISH SOUTH AFRICA COMPANY.

SOUTH AFRICAN REPUBLIC. See TRANSVAAL.

SOUTH AFRICAN WAR, a conflict (1899-1902) between Great Britain and the South African Republic (Transvaal) and the Orange Free State. A considerable body of the Dutch population of South Africa has never been reconciled to the rule of the British, and reasonable grounds for discontent have not been wanting. (See BOERS). The settlement agreed to by Gladstone's government in 1881 after Majuba Hill (q.v.)—followed in a modified form by that of 1884—was generally looked upon by the Boers of the Transvaal as a triumph for them. "Majuba day" was annually celebrated as commemorating a great event in their history, and this tended to keep alive a spirit of hostility to Great Britain, and perhaps

to foster thoughts of a greater triumph that might be attained in the future. The wars with the natives, continued even after 1884, had made the Boers on the whole a military people, and about 1893 President Kruger (q.v.) began to increase the Transvaal armaments, seeing that nothing but force could ultimately keep the Uitlanders—the non-Boer settlers in the Transvaal, especially in Johannesburg (q.v.)—from gaining political rights, and that force would also be necessary to enable him to get rid entirely of British suzerainty, and to secure, what he had long desired, free access to the coast. The Jameson Raid (see JAMESON, SIR LEANDER STARR), an ill-advised attempt made at the close of 1895 by a handful of British subjects, who invaded the Transvaal with a view to gaining some advantage for the Uitlanders—furnished ground for increasing the warlike equipments of the country, and the gold mines of the Rand (see WITWATERSRAND) supplied the funds which were spent on rifles, artillery, ammunition, etc., all of the newest and best types. These funds had to be provided in great part by the Uitlanders, who, though they bore the bulk of the taxation, and owned a great share of the property in the Transvaal, were excluded from any share in the government, and were treated in a harsh and domineering spirit. Early in 1899 a numerous signed petition from British residents in the Transvaal was forwarded by Sir Alfred (now Lord) Milner (q.v.), the high commissioner, to the home government, setting forth the grievances of the petitioners, and declaring their position to have become "intolerable." It was then arranged, on the invitation of President Steyn (q.v.) of the Orange Free State, that matters should be discussed between the high commissioner and President Kruger at the Free State capital, Bloemfontein. The parties held meetings from 31 May to 5 June, but no agreement was reached. President Kruger now submitted to the Transvaal Volksraad a franchise scheme of his own, professedly meeting all legitimate or reasonable claims of the Uitlanders. To this many of his friends gave their approval, though Sir A. Milner thought it came far short of what was required. Then followed more negotiations, which sometimes seemed to give hope of a satisfactory result; but, apart from the franchise question, the claim of the South African Republic to the status of a perfectly independent state still barred the way to a settlement. Meantime the war spirit was rising in the Transvaal. On 8 September the British Cabinet decided to raise the garrison in South Africa to a strength sufficient to protect the colonies. On 9 October the South African Republic presented an ultimatum, delivered to the British agent in the Transvaal, for answer within 48 hours, demanded that all matters in dispute should be settled by arbitration or in some other way to be agreed on; that all troops on the borders of the republic should be instantly withdrawn; that reinforcements which had arrived in South Africa since 1 June should be removed from South Africa within a reasonable time; and that the troops then on their way to South Africa should not be landed. War at once followed, the Orange Free State, by a previous arrangement, joining the neighboring republic.

The war was actually begun by the Boers invading Natal and Cape Colony, Ladysmith in the former and Kimberley and Mafeking in the latter being the places in which the greatest interest was almost immediately centred. At the beginning of the struggle the British regular troops in South Africa did not greatly exceed 22,000 in number, about half of them being in Natal under the command of Sir George White, who had his headquarters at Ladysmith. On 20 October the Boers who had invaded northern Natal endeavored to cut off the British camp near Dundee, where General Symons was stationed with about 5,000 men. They were repulsed at Talana Hill, but the British general was mortally wounded; and the following day they were more severely defeated at Elandslaagte by General Franch's force from Ladysmith. It was necessary, however, to withdraw the northern garrison to Ladysmith, and this was done — after the Boers had been beaten off by General White at Rietfontein. The Boers were now in such force that (with General Joubert as commander-in-chief) Ladysmith was soon completely invested, the railway from the south being seized, as well as the bridge over the Tugela at Colenso. Several naval guns had been brought into Ladysmith before this, which enabled its defenders to reply to the powerful artillery which the Boers had planted on the neighboring heights. Swarming down into Natal the invaders overran the country as far as the Mooi River and beyond, and it appeared that they might even attack Maritzburg; but the first army corps of 54,000 men reached South Africa in November, and Gen. Sir Redvers Buller, who had arrived to take supreme command, took under his charge a large portion of this force, and so was able to drive the Boers back and prepare for the relief of Ladysmith. Other divisions of the reinforcements were dispatched inland from Cape Town, Port Elizabeth and East London to aid in checking the Boer advance into Cape Colony, and to open the way to Kimberley. The force which undertook the latter task was under the command of Lord Methuen, while General Gatacre was to operate against the Boers in the Stormberg district of the Cape Colony, French being in command of a British force between the two. Advancing northward, Methuen assumed the offensive, drove the Boers from a strong position at Belmont, defeated them two days after at Enslin, and on 28 November dislodged them from a strong position at the Modder River, which was crossed without opposition. Then followed a series of reverses to the British troops, which cast a gloom over the whole empire.

On 10 December Gatacre attempted a night attack on a body of Boers strongly posted near Stormberg, but after a toilsome night march his men unexpectedly came upon the enemy's position, which they were unable to capture, and were driven back with heavy loss. On the same day General Methuen had shelled the Boers previously to attacking their position at Magersfontein, where, as at many places afterward, the Boer general De la Rey (q.v.) distinguished himself. Early next morning, while marching to the attack in quarter column, and on the point of deploying, the Highland brigade unexpectedly found itself exposed to a close fire from the Boer trenches and lost very

heavily, the commanding officer, General Wauchope, being killed. The third and most serious reverse took place in Natal. On 15 December General Buller attempted, by what has been generally regarded as an ill-judged plan, to force his way across the Tugela at Colenso, with the view of relieving Ladysmith. This great mistake consisted in attacking two days earlier than arranged for with White, who remained inactive in Ladysmith without knowing what was going on outside. It has not been explained why Buller did not advise White of the change in his plans. Notwithstanding a display of admirable courage on the side of the British, and certain partial successes, the plan as a whole entirely failed, the failure being aggravated by casualties in killed, wounded and missing amounting to over 1,100, while 10 superior guns were abandoned to the Boers. The only son of Lord Roberts (q.v.) fell at Colenso.

On receiving the news of General Buller's repulse, the Cabinet decided to send out immediately the seventh army division already being mobilized, to call up the remainder of the army reserve, to incorporate a new yeomanry force, to allow 12 battalions of militia to volunteer for service abroad, to employ volunteers on active service, and to accept offers of help made by the great colonies. Lord Roberts was instructed to proceed to South Africa as commander-in-chief, with Lord Kitchener as chief of his staff; and Col. Hector Macdonald was appointed to succeed General Wauchope in command of the Highland brigade.

When the year 1900 opened, the troops hemmed in at Ladysmith, Kimberley and Mafeking were holding their own, but at the first place enteric fever had begun to make serious ravages, and to cause much anxiety. In the Cape Colony Methuen was confronted by General Cronje in a strongly intrenched position; and Gatacre, after falling back from Stormberg, was holding Sterkstroom. French in the Colesberg district was more actively employed, and succeeded in defeating the Boers in several important actions. Lord Roberts and his staff arrived at Cape Town on 10 January, but before anything could be done by the new commander-in-chief, Buller made another attempt against the Boer position at Colenso (11 January). With this unsuccessful movement is associated the name of Spion Kop, an eminence in the scene of action the seizure and temporary occupation of which cost many British lives to no purpose. Yet a third attempt was made to break through to Ladysmith (5 February), Vaal Krantz being a position which figured most prominently on this occasion; but again the result was only disappointment, to the besieged force more especially. Meanwhile Roberts had been making plans for more effectively dealing with the enemy, and had collected a strong cavalry force under French between the Orange River and the Modder. While the attention of the Boers under Cronje was drawn off by a movement carried out by Macdonald and the Highland brigade, French advanced rapidly on Kimberley and, in spite of all opposition, reached the place, dispersed the investing troops, and entered the town (16 February). Cronje at Magersfontein had now allowed himself to get into a difficult position, not fully realizing the strength and intentions of the British, and though he tried to escape

eastward toward Bloemfontein, it was too late. He was brought to a halt at Paardeberg, took refuge in the bed of the Modder, where he managed to hold out for a week, but being completely hemmed in, and an attempt at his rescue by General De Wet being defeated, he surrendered to Roberts with over 4,000 men. This was on 27 February, the anniversary of Majuba Hill. Cronje and the rest of the prisoners were sent to Saint Helena. Meanwhile fresh efforts were being made by Buller for the relief of Ladysmith, and this time with success. After a series of difficult operations, the Boer left was finally turned, and on 28 February Lord Dundonald rode into Ladysmith, being followed by Buller two days later. The garrison was found to be in sore straits for want of food, and had suffered severely from disease as well as from the attacks by which they had been harassed. One of the fiercest of these had been made on 6 January, when the Boers had endeavored to take the town by storm, but were repulsed with heavy loss. On this occasion a position known as Wagon Hill had been three times captured and recaptured in the course of the day, Gen. Ian Hamilton (q.v.) here greatly distinguishing himself. It has been said that "the successful defense of Ladysmith was from a military point of view the most valuable achievement of the war, inasmuch as the loss of a garrison of 12,000 men would have been a graver disaster than any conceivable defeat in the open field; and, moreover, the fall of Ladysmith was to be the signal for the general rising of the Dutch in the Cape Colony and Natal." Following on the successes in the west of the Orange Free State came successful operations by the generals in the northern parts of Cape Colony—Gatacre, Clements and Brabant. Bloemfontein now became Roberts' objective, and after Joubert had vainly attempted to bar his way at Poplar Grove, and again at Driefontein, the British commander entered the capital of the Orange Free State practically without opposition (13 March). Kruger and Steyn fled to the north. The keys of the town were surrendered to Lord Roberts, and the railways being soon repaired, through communication was opened between Bloemfontein and Cape Town. The Orange Free State was proclaimed British territory.

There was a long halt at Bloemfontein, and during this period enteric fever proved a terrible scourge to the British, and the Boers were encouraged to fresh activity. Several mishaps now befell different bodies of British troops, and De Wet proved himself a leader of exceptional ability on the Boer side, while Louis Botha (q.v.) also gained distinction for himself, having succeeded to the chief command on the death of Joubert (27 March). The advance northward from Bloemfontein began on 3 May. The British forces under Gens. Ian Hamilton, French and Pole Carew, with Lord Roberts at their head, often showed a front of 40 miles, and though the enemy repeatedly seemed to threaten a determined stand, no effective resistance was encountered, either on the Vaal or elsewhere. One after another the Boer positions were turned; Botha's troops fled in confusion from Johannesburg, where the British flag was hoisted on 31 May, and Pretoria, the Transvaal capital, was occupied on 5 June, no

attempt being made by the Boers to hold the forts. General Botha and a considerable body of men retired eastward along the railway in the direction of Komati Poort, near the Portuguese frontier, in which direction President Kruger, Mr. Reitz and other members of the Transvaal government had preceded him. The Boers were followed and beaten at Pienaar's Poort, about 15 miles from Pretoria. Meanwhile Buller had been advancing northward through Natal, and had entered the Transvaal from that side, driving the Boers before him. On 15 May Dundee and Glencoe were retaken, on the 17th Newcastle, and by the end of the month he was encamped within striking distance of Majuba and Laing's Nek, which were strongly held by the enemy. But by a skilful turning movement General Hildyard secured command of the Boer positions, which were at once evacuated. Buller's force had marched 50 miles in six days, and had defeated the Boers in four engagements. His troops were thus put in a position to co-operate with the main army under Lord Roberts, and early in July the railway to Pretoria from Durban was open. The number of British troops in South Africa by the middle of the year was about 250,000.

Shortly after the middle of May (1900) news reached England that the Boers had been driven from Mafeking, and that the town had been entered by a British force from the south. The place had been invested from 15 October, when Cronje with a force of some 9,000 men had marched to the attack. It was well supplied with stores, and this, together with the indomitable energy and fertility of resource shown by Major-General Baden-Powell, who commanded the small garrison, enabled it to hold out against all attempts to capture it. A last attempt to take it had been made on 13 May by Commandant Eloff, a grandson of President Kruger. This not only failed, but the leader and a number of his men were themselves taken prisoners.

In the end of July an important success was gained in the Orange Free State (now called Orange River Colony) by General Hunter, with the aid of Generals Rundle, Clement, Bruce-Hamilton, Paget and Macdonald. As the result of a combined movement, a force of some 4,000 Boers under Prinsloo was surrounded by the British troops and forced to surrender with guns, horses and wagons, the burghers being sent as prisoners to Ceylon. De Wet, with 2,000 men, escaped, as on various subsequent occasions.

Advancing eastward from the Pretoria district Roberts joined hands with Buller, and from his headquarters at Belfast issued a proclamation annexing the Transvaal to the British dominions (1 September). Previous to this Buller had forced the Boers from a strong position they had taken up near Machadodorp, and had thus effected the release of a large number of prisoners whom they had taken with them from Pretoria.

On 11 September President Kruger took refuge in Portuguese territory, and many of his compatriots followed his example, or scattered in different directions, having previously destroyed many of their guns, with vast quantities of ammunition and stores. Lord Roberts reported that there was nothing left of the Boer armies but a few marauding bands, but this

view of the case proved premature. On 6 October Buller left the army for England; on the 20th President Kruger sailed for Europe on board a Dutch man-of-war. Lord Roberts left for home before the end of the year, handing over the chief command to Lord Kitchener.

The war had now entered upon what might be called the guerrilla stage, during which the activity and daring of such leaders on the Boer side as Botha and De Wet gave plenty of hard work to the British troops. Looking with confidence for support from their kinsmen in the Cape Colony and Natal, and still hoping for the intervention of some European power, the Boer leaders planned two enterprises which they thought might yet retrieve their cause. Botha, with some 6,000 men, was to make a sudden dash into Natal and raid the country, if possible, all the way down to Durban, while De Wet was to execute a similar movement in the direction of Cape Town. These attempts were made in the early part of 1901. Botha's plan was completely frustrated by a great sweeping movement of General French; the Boers were dispersed with the loss of guns, wagons and immense numbers of cattle and sheep. De Wet fared no better but, like Botha, he himself escaped capture, though losing guns, ammunition and wagons. Marauding bands that had belonged to his force managed, however, to enter the Cape Colony, and for a time gave much trouble, aided and encouraged as they were by their Dutch friends. To checkmate the Boer system of warfare Kitchener resolved to clear the country of food and cattle so as to deprive the Boers of supplies, to protect the railways by chains of blockhouses, to carry similar chains across the country in suitable directions, and to keep the Boers perpetually on the move by mobile columns of British troops. Kitchener's measures, which were found exceedingly effective in the long run, included the gathering together of great multitudes of Boer women and children into the so-called concentration camps, a measure widely discussed and much condemned in the press of neutral countries.

A discussion regarding terms of peace took place between Lord Kitchener and General Botha on 28 March 1901, but nothing came of it; the gradual wearing down of the Boers went on, and by the end of May they had lost practically all their artillery (apart from guns buried in the earth). On 12 July the Free State government and some important papers were captured at Reitz, and President Steyn himself made a narrow escape. On 7 August Kitchener issued a proclamation calling for the surrender of the Boers by 15 September, on pain of the perpetual banishment of the leaders, and of the property of the others being charged with the cost of maintenance of their families in British hands. The Transvaal and Free State leaders had been discussing the advisability of giving in, but President Kruger, from Europe, urged them to continue fighting until their independence was secured. Renewed activity on the part of Botha, De Wet and other Boer leaders followed, and the British met with one or two rather serious mishaps. By the end of the year 1901 there had been put out of action some 53,000 Boers, of whom 40,000 were in concentration camps or were kept in custody in Saint Helena, Ceylon, India, Bermuda or elsewhere. After some great "drives" organ-

ized by Kitchener and carried out in the early part of 1902, which resulted in the surrender of many burghers, and which owed their success largely to the blockhouse system, negotiations for peace were at last entered on (23 March), though military operations were not suspended. The Boer leaders were granted facilities for meeting and discussing matters among themselves and with the different commandoes, and after this had gone on for some time, on 15 May a conference of Boer representatives met at Vereeniging to consider terms of surrender. Among those present were Botha, Beyers, Smuts, De Wet and Delarsy. It was not until the last day of the month, however, that peace was absolutely secured, the surrender being signed at Pretoria by Lords Kitchener and Milner and the chief civil and military representatives of the Boers, and the war thus brought to an end. After over two-and-a-half years' war the whole of South Africa, from Cape Town to the Zambesi, had been added to the British Empire. The main points agreed upon were: that the Boer forces would immediately lay down their arms and hand over all guns, rifles and munitions of war; that burghers in the field outside the Transvaal and Orange River Colony, and all prisoners of war outside South Africa, on declaring their acceptance of the position of subjects of Edward VII, should be brought back to their homes as soon as transport could be provided and their means of subsistence secured; that no proceedings civil or criminal should be taken against burghers so surrendering or returning, for acts done in connection with the war, unless as regards acts contrary to the usages of war; the Dutch language to be taught in public schools where parents desire it, and to be allowed in courts of law; the possession of rifles to be allowed to persons requiring them for protection, on taking out a license; military administration to be succeeded as soon as possible by civil administration, and ultimately representative institutions and self-government; a sum equal to \$15,000,000 to be granted for the purpose of assisting in the restoration of the people to their homes, besides advances on loan free of interest for two years. These terms were practically the same as those rejected by Botha 13 months earlier.

In this struggle there had been engaged on the British side at one time or another, or sent to the seat of war as reinforcements, from the outbreak of war until the conclusion of peace, 448,435 men of all arms, including 228,171 regulars, 45,566 militia, 35,520 yeomanry, 19,856 volunteers, 7,273 South African constabulary, 18,229 regular troops from India, 29,000 colonial contingents, 52,414 raised in South Africa. Of these 518 officers and 5,255 men were killed, 1,851 officers and 20,978 men were wounded, 554 officers and 15,617 men died of wounds or disease. How many men the Boers had in the field from first to last, including the rebels belonging to Cape Colony and Natal, will probably never be known. The number has been estimated by competent authorities at 60,000 to 65,000. The Boer casualties have never been definitely ascertained.

SOUTH AMBOY, N. J., borough in Middlesex County, at the mouth of Raritan River and the head of Raritan Bay, and on the Pennsylvania, the Central of New Jersey and the Raritan River railroads, 20 miles south of Newark. It was founded in 1835 and became a borough in 1888. It is important as a shipping point for coal, and has terra-cotta works, clay and sand pits and asphalt works. The most notable public building is the borough hall; and there are two public schools and a Roman Catholic parish school. The government is vested in a mayor and a council of six; two members of which are elected each year for a term of three years. Pop. about 7,007.

SOUTH AMERICA, a continent the estimated area of which is, in round numbers, 7,300,000 square miles with an estimated population of 57,000,000 in 1919. It is joined to Central America by the Isthmus of Darien, the boundary-line between Colombia and the Republic of Panama being taken as its limit on the northwest. The westernmost point on its Pacific Coast is directly south of the peninsula of Florida; both the extreme northerly point, projecting into the Caribbean Sea, and, at the extreme south, the archipelago of Tierra del Fuego, adjoin long. 70° W., which is also the longitude of Cape Cod, Massachusetts. Thus, its Pacific Coast and one-half of its Caribbean Coast lie due south of the Atlantic Coast of the United States. Moreover, only a relatively small part of the great equatorial land-mass between lat. 10° N. and lat. 25° S. is west of longitude 70°. The Atlantic coasts form an enormous angle reaching so far toward the east that sailing distances between Pernambuco and some of the European ports are practically equal to the sailing distance between New York and the same Brazilian city. In reality, then, South America, from the point of view of

inhabitants of the United States, is Southeastern America.

For the varied purposes of social intercourse and commerce, therefore, its eastern coasts below the equator are as readily reached from Europe as from the great centres of population in the United States; and before the Great War this virtual equality in geographic situation was converted into marked advantage for Europeans by the superior facilities for transportation and direct intercommunication between Europe and the especially important South American Atlantic ports, to say the least,—an advantage which was accentuated, so far as it concerned the nations of southwestern Europe, by ancient association, force of habit and essential community of tradition and language. The results were that a large part of the southeastern continent, while developing distinctively New World characteristics in many ways, still constantly received formative ideals and manners, culture and its fashions, from West-European sources, and of course bestowed its trade in the same quarter. For studies of other causes which tended to produce similar effects, and for an account of changes wrought during the World War, see **LATIN AMERICA**.

Since the war ended, phases of readjustment to changed conditions in foreign relations, or of new developments in time-honored American connections, have naturally been most in evidence; and of such phases there are three which deserve special mention: First, a movement the aim of which is to promote the peace and progress of the Western Hemisphere and to confirm Pan-American solidarity (compare Special Memorandum: *American Questions and the Monroe Doctrine*, issued by the Pan-American Union, Washington, April 1919); second, the admirable quality of the views expressed, and confirmed by resolution, in the First American Congress of Economic and Commercial Expansion, which was held at Montevideo, official representatives from all South American republics being in attendance, and which advocated the establishment of colleges or departments of economic expansion in colleges and schools, to the end that "the study and practical solution of economic problems may be intensified in the effort to cement Pan-America commercial friendship"; third, the actual state of foreign trade as between the United States and South America, an estimate by the National City Bank of New York showing, for the fiscal year 1919, imports from South America gaining about 150 per cent, compared with those of 1914; exports to South America about 225 per cent; the total trade of the United States with South America, including both imports and exports, which amounted only to \$345,000,000 in 1914, being estimated by the same authority at \$1,000,000,000 in 1919.

The South American republics are Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay and Venezuela. Dependencies of European countries on the mainland are the three Guianas—British, Dutch and French. The Falkland Islands, which are included in the foregoing estimates of area and population, are British. ures, money, banks, government (including the judiciary and the departmental, state or provincial governments), army and navy, finances (revenues, expenditures and public debt), foreign and domestic commerce, population, immigration, transportation, climate, flora and fauna, educational system, religion, history, literature and art, bibliography, etc.—see the articles devoted to the country in question, to its chief cities and political divisions; also the articles under the general caption Latin America. Important geographic features are described at greater length in separate articles, e.g., ANDES, and such features also form a part of the wider survey in the article AMERICA. For lists of standard works on South America, the reader is referred to bibliographies appended to the articles mentioned above.

MARRION WILCOX.

SOUTH AMERICA, American Diplomatic Relations with. In 1783 the future influence of the new-born American republic upon Spanish America was foreseen by the apprehensive Spanish Prime Minister, Aranda. Three years later Gordoqui, the Spanish Minister to the United States, reported that Americans would probably form an establishment on the Falkland Islands to which many American vessels had gone fishing in 1784 and 1785.

In 1787 American vessels sailing from Boston for the west coast stopped at the island of Juan Fernandez in direct violation of the Spanish restrictive order of 1782 which forbade foreign ships to navigate the South Seas without the permission of Spain. In 1790 other American vessels stopped at the Lobos Islands. Thereafter, in spite of the alarm of Spanish officials, a steadily increasing number of vessels contributed their influence to the development of new ideas along the Pacific Coast. By 1798 Salem merchants began with Cayenne a trade which rapidly pressed eastward along the Brazilian Coast. In 1799 American trading vessels (from Philadelphia) first reached Montevideo. By 1801 others (from Boston and Providence) first opened direct trade with Buenos Aires. American trade thereafter both with Brazil and with ports of the Plate rapidly increased. In 1803, when Spain complained that American vessels had participated in the fishery of sea dogs on the South American Coast, Secretary Madison, by direction of Jefferson, replied that Spain was not expected to controvert nor interrupt the "rights of American citizens to navigate and use the seas."

Through efforts of business men and whalers ideas of republicanism and independence were introduced. As early as 1798 leading Americans were attracted by the schemes of Miranda for inaugurating a revolution in Spanish America. In 1806, even before the British expedition of that year against the Plate territory of Buenos Aires, adventurous Americans participated in an ill-timed and unsuccessful expedition against Venezuela which Miranda equipped at New York under the representation that he had the secret sanction of the American government at Washington.

In the Spanish-American Revolution which began in 1810, the American government took a live interest illustrated in the prompt appointment of consular (or political) agents; but, in

the face of strong suggestions or invitations for "fraternal alliances which would unite the Americas forever," it maintained an impartial neutrality, opening its ports equally to both parties and restraining its citizens from interfering in favor of either belligerent (although the American agent J. R. Poinsett directed the Chilean army in a successful attack against the Peruvian forces in 1813). In 1815 William Thornton, a friend of the three early Virginian presidents, published a plan which he had advocated 15 years earlier, in favor of extending the republican system over all the Americas, and the adjacent islands—13 sections with distinct governments but united by one general government at the "City of America" on the Isthmus of Darien across which a lock canal was to be constructed from sea to sea. In 1815 President Monroe issued a neutrality proclamation, and in 1817 Congress enacted a neutrality law, which, amended in 1818, established a higher standard of national obligation.

In 1818 President Monroe received a tempting proposition for separation of all Spanish America from Spain and the establishment of its freedom under the protection of the United States which under the plan was to extend its territorial limits to the Isthmus of Panama.

Finally, in March 1822, yielding to an obligation of duty, President Monroe recommended the recognition of Venezuela, Chile, Colombia and La Plata provinces as independent states—a fact practically admitted by Spanish official negotiation with the insurgents and enforced by the absence of adequate Spanish forces to dispute it. On 17 June he received a regular diplomatic agent from Colombia (Don Manuel Torres). In January 1823, under act of May 1822, he appointed ministers to Argentina, Chile and Colombia, and in December 1823 issued the famous expression of policy against forcible intervention by a combination of European powers to restore Spanish dominion over the new republics. On 3 Oct. 1824 the American government concluded with Colombia at Bogotá the first American treaty with a Latin-American republic—the first of a long series of treaties of amity and commerce with the republics, and containing liberal provisions for the abolition of discriminating duties and remained in operation until 1836. In May 1826, it recognized the independence of Peru which had recently been successful in obtaining the surrender of Callao, the last Spanish fortress in South America. In 1825 and thereafter both by direct representation at Madrid and by solicitation of the co-operation of other European powers, it sought to induce Spain to recognize the government of the new republics created from her former provinces and in September 1834 it finally obtained a decision in favor of negotiations to that end. In 1825 it recognized the independence of Brazil which had been proclaimed in 1822 and established by force a year later.

Still in fear of Portugal and under a misapprehension of the meaning of the Monroe Doctrine, Brazil sought an alliance with the United States which secretary Clay courteously declined. In July 1824 Colombia also inquired whether the United States would agree to enter into a treaty of alliance to save the Americas from a calamity of the despotic system, but Jefferson advised

Monroe to reply that the United States could not protect them without concurrence of England. In 1826 in response to the invitation of Colombia and Mexico, the American government sent delegates to the Panama Congress of American plenipotentiaries called by Bolívar's famous circular of 7 Dec. 1824; but, owing to delay caused by the disapproval of the American senate, the delegates failed to reach Panama in time for the Congress, thus disappointing Latin-American expectations. Whatever plans may have been conceived by the Adams administration for American hegemony of the American continent (as suspected by Canning) were weakened by the publicity which the Panama debate gave to American racial prejudices and by contemporary American protests against the proposed Colombian-Mexican attack on Cuba.

In 1825-26, the possible need of a more competent naval force on the west coast (to protect American commerce from possible piracy which might result from the unsettled condition of South American governments) first attracted the attention of the American government to the need of a trans-isthmian passage at Panama which was again considered in 1835 (when Charles Biddle without proper authority of President Jackson went to Panama and obtained a canal concession which his government declined to accept) and finally resulted in a transit treaty with New Granada in 1846.

In 1831 a long dispute with Argentina arose through the American destruction of an establishment which the government of Buenos Aires had made on the Falkland (or Malvinas) Islands, afterward (1833) effectively occupied by Great Britain under a claim of title asserted and maintained for 60 years. To the unsettled shores of these islands American citizens engaged in whale and seal fisheries had resorted for shelter and necessary supplies without molestation for more than 50 years, and they objected to the seizure of their vessels in 1831 and imprisonment of crews at Soledad by one Vernet who claimed to act under an indefinite decree issued by Buenos Aires on 10 June 1829. The American government, regarding Vernet's acts as lawless and piratical, promptly asked Buenos Aires for a disavowal and sent a naval vessel which deported Vernet and his followers to the shores of Uruguay. Following the demand of the Argentina government for reparation, Mr. Baylies, the American chargé, demanded his passports, resulting in a severance of diplomatic relations for several years. In 1841 General Alvear at Washington pressed claims for indemnity which Secretary Webster declared must await the final settlement of the British-Argentine controversy over the right of jurisdiction to the islands. The long-dormant claim of American liability was revived in 1883-85 and pronounced by the American government as wholly groundless because of the derelict condition of the islands which justified the act of the American naval officer.

After 1840 the increasing importance of closer relations with South America was recognized. As early as December 1842 the American government received information of a proposed Lima Congress of Latin-American

states (Argentina, Peru, Bolivia, New Granada, Brazil and Mexico) to sustain the dominant parties in those states and to oppose the advance of the United States on the American continent. In 1845 Argentina and other South American governments were disappointed in their hopes of active interference of the American government against the Anglo-French blockade of the coast of Buenos Aires, resulting from Brazil's invitation of 1844 for their intervention to protect the independence of Uruguay which had been recognized by a treaty of 1828 signed both by Brazil and by Buenos Aires. The American government, satisfied with assurances obtained from the British government and apprehensive of no danger from temporary European intervention, decided to remain neutral. In 1844 for protection of American interests it sent a small fleet which offended the Argentina government by seizure of vessels of the Argentina squadron—an act which was promptly disavowed. Later, in March 1846, Secretary Buchanan, stating that the moral influence of the United States was in favor of Argentina, instructed the American Minister at Buenos Aires to report promptly any British-French activities indicating territorial designs. In June 1845 Edward A. Hopkins was appointed "special agent" to Paraguay to obtain information with a view to possible recognition of its independence, but in 30 March 1846, largely from regard to Argentina, he was peremptorily recalled for exceeding his authority by his diplomatic negotiations with Paraguay in favor of recognition and by an offer of mediation between the governments of Paraguay and Buenos Aires in favor of Paraguay which by league with Corrientes against Argentina would have become the ally of England and France in their designs. Fortunately the perplexing question presented to the American government by participation of European powers in La Plata affairs was finally settled by discontinuance of the blockade, first by England and soon thereafter by France. In 1850 the American Minister at Buenos Aires in reply to a hypothetical question dispelled the illusion of General Rosas that the United States would aid Argentina to resist France in case of war. In 1846 serious complications were threatened by disturbances at Panama, across which communication became very important to the United States, and by a projected expedition of General Flores (formerly president of Ecuador) against Ecuador—an expedition which was supposed to have for its purpose the creation of monarchies in the new world. Two years later, Venezuela, fearing British designs of annexation along the Guiana border as a result of British activities there since 1841, turned to the United States in hope of an alliance. At the same time new dangers of disorders were threatened by a territorial quarrel between Peru and Bolivia.

In order to secure a more satisfactory transit treaty of isthmian transit than the arrangement which had been negotiated in 1844, the American government concluded a treaty in 1846 providing for equality of use of the transit route for the commerce and citizens of both countries under American guarantee, really establishing an American protectorate

over the isthmus, but for a commercial purpose in which all the world had a common interest, and with expectation of similar guarantees by Great Britain and France. It became effective on 10 June 1848. In 1847 in reply to invitations for protection against the apprehended Flores expedition, Secretary Buchanan reported that Spain through Calderon had disavowed to the American government any part in the proposed expedition—thus indicating her abandonment of intention to encourage similar expeditions and removing a main source for apprehension of serious dangers. Later, in May 1848, he assured Ecuador (through instructions in opening regular diplomatic relations) that the American government on every occasion would employ at least all the moral means within its power to discourage and arrest intervention or dictation of European governments in the affairs of independent states of this American hemisphere.

The matured Latin American policy of the Polk administration was expressed by Secretary Buchanan on 1 June 1848 in opening diplomatic relations with Bolivia, the only independent Latin-American country to which the United States had not previously sent a Minister. Urging the necessity of the establishment and maintenance of an American system of policy for protection and security, and emphasizing the fact that "Liberty cannot be preserved without order," he especially hoped that Peru in order to prevent future irritation and dissension would agree to cede the port of Arica to Bolivia. Possibly encouraged by President Taylor's expression of the American general policy in 1849, Venezuela in 1851 proposed that the United States should form an alliance "or at least take a more decided stand to protect the South American republics."

In the decade after 1850, the period of American clipper-ship activity in the Pacific, the American government actively used diplomacy to secure protection and expansion of commerce with Latin America—at the same time continuing a policy of securing respect for American commerce by enforcement of American claims for injuries to persons and property. Among the most important subjects of diplomatic negotiation besides claims were the conditions of the guano trade on the west coast, the danger of European influence, the opening of South American rivers to foreign commerce and the conditions of transit at Panama.

In 1852, in connection with difficulties resulting from restrictions on the guano trade, the American government, through Secretary Webster, took steps to protect American interests on the detached Lobos Islands which had been visited by American seamen for half a century, but after an investigation of claims of title soon decided through Secretary Everett to yield to the protests of Peru. In 1858, during the Vivanco insurrection in Peru, a diplomatic dispute arose over the rights of American vessels to obtain guano at the Chinca Islands in connection with the Peruvian seizure of two guano vessels, and resulted in the suspension of diplomatic relations in 1860.

The American acquisition of the Gallapagos Islands from Ecuador, suggested about 1852, was apprehended by Spain, France and Great Britain late in 1854 in connection with an

American draft treaty with Ecuador, which was regarded as establishing an American protectorate over the islands which had long been important in connection with American commercial interests in the Pacific. At that time Ecuador, still apprehensive of the plans of General Flores, urged the necessity of eternal vigilance to prevent vast schemes for European ascendancy in South America, and apparently New Granada desired the American government to adopt a more liberal policy of sustaining and protecting the nations of South America. The American Minister (Clay) at Lima, convinced that the United States would be forced by circumstances to interfere in the affairs of other states, urged his government to adopt a more effective foreign policy in relations with Spanish America and the establishment of a controlling influence in the western hemisphere. By 1856 there was a decided decline in South American friendliness toward the United States—a decline which resulted largely from the filibustering schemes of William Walker in Central America and which found expression in the "Continental Treaty" signed at Santiago de Chile by representatives of Chile, Peru and Ecuador and designed to form a closer relationship of all Latin American republics. In 1857 the American Minister (Dana) in Bolivia, desiring to create a better Latin American feeling toward the United States, suggested to his government that the basis of the American fixed policy should be the Monroe Doctrine, nonexpansion southward of the Gulf and treaties of alliance guaranteeing the integrity of Spanish America.

In the opening of South American rivers the American government took an active part through diplomacy. In October 1852, after the defeat of the Argentine dictator (General Rosas) by the governor of Entre Rios, it obtained the navigation of the Parana and the Uruguay, which were opened to the merchant vessels of all nations by General Urquiza (provisional director of the Argentine confederation), a privilege later confirmed by treaties with the United States, Great Britain and France in July 1853. At the same time it began preparatory negotiations to secure for American vessels the navigation of the Paraguay River and upper Parana which, after various difficulties resulting in an American naval demonstration, Paraguay was finally induced to grant in 1859 by treaty. Its efforts to obtain the consent of Brazil to the opening of the Amazon, first contemplated even before 1850, begun in 1851 by instructions to naval officers to explore the river from Peru eastward and report its facilities for navigation and its opportunities for commerce, and involving a series of negotiations with Peru and Bolivia and with other countries on the upper waters of the river, reached partial success in 1858 by a treaty with Bolivia guaranteeing the United States access to Bolivian ports on the upper Amazon, and finally attained full success in the Brazilian decree of 1866 declaring the Amazon and its tributaries open to the commerce of all nations. Relations with New Granada concerning the Panama transit route across which an American railroad had been completed in 1855 were especially irritated in 1856 by a riot at Panama, resulting in a series

of claims which were not finally settled until 1866. Following the riot Secretary Marcy, desiring to facilitate and protect the transportation of persons and property across the Isthmus, proposed to New Granada a new treaty for lease and cession of a belt of land 20 miles wide from Atlantic to Pacific, and certain islands in the Bay of Panama for use as naval stations, but New Granada declined to negotiate such a treaty.

During the period of civil war resulting from slavery and secession, the American government had little time to cultivate intimate political, social or commercial intercourse with South American countries. On questions in regard to foreign intervention, it maintained the letter of the Monroe Doctrine, but carefully declined South American invitations or suggestions seeking American adhesion to an alliance to guarantee the sovereignty of South American states. A difficult question arose in 1862 in regard to protection of the Panama transit route. The American government through Secretary Seward recognized American duty at Panama but carefully avoided interference in the internal quarrels of Colombia. The adjustment of claims through conventional arrangements for claims commissions or arbitration, begun before 1860 and continued even during the Civil War period, became especially prominent thereafter and removed many sources of irritation and possible collision. The more important in a period of four decades were negotiations with New Granada (or Colombia) in 1857, 1864 and 1874-75; with Chile in 1858, 1873 and 1892; with Paraguay in 1859 and 1887; with Venezuela in 1859, 1866, 1888 and 1892; with Ecuador in 1862, 1865 and 1893 (Santos case); with Peru in 1863 and 1868; and with Brazil in 1870.

Since 1865 the American government has frequently indicated its friendly desire for the welfare and peaceful relations of South American neighbors. When Spain, in a war begun against Peru in 1864, threatened to seize the Chinca Islands, the American government promptly expressed its opposition in a protest to the proposed annexation, although it carefully avoided any actual participation in the war into which it could easily have been drawn by the expectations of Chile and Peru, and stated that American policy did not shield American states from a discharge of their just obligations.

In 1866, when Spain threatened to take permanent possession of the islands as a means of reimbursing the expense of the war through the sale of guano, Secretary Seward secured her withdrawal by a warning that in case of such occupation the United States could not be expected to remain neutral. American mediation resulted in conferences between representatives of the United States, Spain and the allied republics at Washington, and finally in an armistice (in 1871) which, after considerable delay, eventuated in a treaty of peace. A later controversy between Peru and Chile concerning expenditures in maintaining the allied naval squadron in this war was arbitrated in 1875 by the American Minister to Chile by consent of the American government.

Meantime, in October 1866, the American government, although in the interests of peace willing to exercise its good offices to aid in stop-

ping the unhappy war of La Plata (directed against Paraguay by Brazil, Argentina and the Oriental Republic), declined to adopt suggestions for a demonstrative action following the Brazilian rejection of the American good offices. In 1871, acting promptly on a report that Germany had proposed to several European powers the adoption of joint measures to induce Venezuela to observe her agreements, it declared that the United States would observe with great concern the presentation and enforcement of demands against an American state by such a combination.

In 1881 Secretary of State Blaine planned for the United States to assume the position of sole mediator in international disputes to which Latin American republics were parties, but his policy was not continued by his successor. In 1881 the American Ministers at Buenos Aires and Santiago de Chile successfully arbitrated a boundary controversy between Argentina and Chile. In the same year two special American envoys, sent by Secretary Blaine to secure peace between Chile and Peru and Bolivia, which were at war for possession of the nitrate mines near the junction of their boundaries, were unfortunately unsuccessful in their efforts and each was regarded as the partisan of the country to which he was sent. Later the experienced Wm. H. Trescott was sent to warn Chile against excessive demands which might induce the United States to secure co-operation of other American powers to coerce her into reasonable moderation.

Acting on this principle of pan-Americanism, Blaine in 1881 sent invitations to all independent American nations to meet for a discussion of arbitration, but these were recalled by his successor who postponed the conference. The American government promptly recognized the new republic of the United States of Brazil, which was proclaimed following a revolution in the fall of 1889 which resulted in the expulsion of the enlightened Emperor Dom Pedro II and his family on 14 Nov. 1889. In 1893-94 it declined to respect a blockade proclaimed (but later abandoned) by Brazilian naval insurgents against the Brazilian government in the Bay of Rio Janeiro. After having refused to recognize as belligerents the insurgents who claimed to have set up a provisional government at Desterro on the island of Santa Catharina, in January 1894, Admiral Benham, in command of American naval forces and acting in accord with the decision with naval commanders of German, English, French, Portuguese and Italian naval forces, gave notice and practical evidence of his intention, while not intervening to restrict the operations of either party, to protect all American ships entering the Rio waters, thus inducing the insurgents to abstain from further interference with commerce, and perhaps contributing to the later unconditional surrender of the insurgents (on 13 March 1894). In 1889 the President of the United States was chosen arbitrator in the settlement of the Argentine-Brazilian dispute in regard to Misiones territory and finally, in 1895, made an award in favor of the Brazilian claim—a conscientious decision which was gratefully accepted by both governments.

With the increase in the importance of American foreign trade of the 19th century,

the American government took steps toward drawing the American states into closer relations in conformity with the idea of a community of interest emphasized so long before by the undefined political bond of union established by the Monroe Doctrine. A comprehensive Pan-American international conference for closer co-operation, such as had been contemplated at Panama in 1824-26 and in later proposals, already partially realized by conferences at Lima in 1847-48, in 1864 and in 1877-78, and at Montevideo in 1888-89, planned by Blaine in 1881, was finally realized at Washington in 1889, resulting in a better understanding and in later conferences which further emphasized the idea of a community of American interests. It established at Washington the International Bureau of American Republics (renamed the Pan-American Union by the Fourth Pan-American conference in 1910) which rendered valuable service by its practical activities. The second Pan-American congress which met in Mexico on 22 Oct. 1901, largely through the quiet suggestion of President McKinley, who tactfully planned to counteract the unfortunate distrust of the United States among Latin Americans, was attended by representatives of all the American republics. Its chief topics of discussion were arbitration and collection of pecuniary claims of citizens of one country against the government of another country. It approved a project for a treaty under which pecuniary claims should be submitted to the international tribunal of arbitration which had been provided at The Hague. It extended the activities of the International Bureau of American Republics, which was also invested with authority to arrange for subsequent congresses. A third Pan-American congress, which met at Rio Janiero, 21 July 1906, was attended by delegates from all American republics except Haiti and Venezuela. It recommended that the next Hague congress should seek to secure a general arbitration treaty and take steps toward the abolition of the use of force in the collection of international debts. The fourth Pan-American congress, which met at Buenos Aires in July-August 1910, discussed compulsory arbitration of pecuniary claims, sanitation, extension of steamer service, patents, trademarks, copyrights and interchange of university professors.

In 1891 a serious difficulty arose between the American government and Chile, with which relations had become somewhat less friendly after 1880 as a result of Secretary Blaine's apparent sympathy with Peru in the War of the Pacific. The decidedly unfriendly feeling created by the American Minister (Patrick Eagan) among the Chilean leaders of the victorious party in the Chilean revolution of 1891, and increased by the American strict interpretation of neutral duties in the seizure of the *Itata*, later culminated in an assault upon sailors of the American cruiser *Baltimore* while ashore at Valparaíso in October 1891, resulting in the suspension of diplomatic relations and an American ultimatum (from Secretary Blaine) to which Chile grudgingly yielded by an apology and the payment of \$50,000 damages for the families of persons killed and for the wounded.

In 1895 the American government in applying the principles of the Monroe Doctrine against Great Britain in the Venezuela-Guiana boundary dispute showed a friendly disposition toward Venezuela which was appreciated elsewhere in South America, in spite of Secretary Olney's extreme interpretation, including the provoking assertion that the American fiat was law on the American continent. Later friendly American acts appeared in striking contrast to the bad conduct of the Venezuelan government. Although the American government did not accept the Venezuelan appeal to intervene in 1902 against the debt-collecting activities of Germany and Great Britain (in which it had been invited to participate but which it did not approve), President Roosevelt firmly resisted the later plans of Germany and was successful in terminating the blockade of Venezuela by securing arbitration of the controversy at The Hague under a protocol signed at Washington on 13 Feb. 1903. This friendly action, together with the example of American policy in Cuba contributed much to remove Latin American suspicions arising from the Spanish-American War, American negotiations preliminary to the construction of the Panama Canal and various extensions of the Monroe Doctrine which aroused apprehensions. Unfortunately American relations with Venezuela became strained in 1907, under the presidency of Cipriano Castro, by a serious controversy arising from certain American asphalt concessions and by the arbitrary expulsion of an American editor of a Venezuelan newspaper. The American government, seeking adjustment of all asphalt claims, proposed arbitration, which was refused by Castro. It then agreed to a plan of arbitration by separating the claims, as Castro proposed, but to which he later objected (in March 1908), absolutely refusing to arbitrate any of the cases. In June 1908 the American government withdrew its Minister and suspended diplomatic relations, and two months later offered no objection to the contemplated forcible action of the Netherlands against Castro in return for his conduct against the Dutch islands near the Venezuelan coast. But, when Castro took flight from his troubles, leaving executive affairs in charge of a more reasonable official, J. V. Gomez, who sought a restoration of friendly relations, the American government sent to Venezuela a special commissioner, William I. Buchanan, who on 13 Feb. 1909 signed a protocol under which all disputes were satisfactorily settled—two immediately, two within five months and a last remaining one by later adjudication of The Hague.

American relations with Colombia, which before 1860 were largely concerned with problems of a transit route across Panama, since the American Civil War, were largely influenced by revived American interest in the question of the Panama Canal. In 1868, in accord with the wish of Colombia for certain changes in the treaty of 1846, the American government authorized special negotiations at Bogotá, which resulted in a draft treaty embodying the Monroe Doctrine and securing to the United States absolute control of any canal across the isthmus. This new treaty, although approved by Secretary Seward, was rejected by the Senate of Colombia and changed by amend-

ments and alterations which (in February 1869) failed to receive the approval of the American Senate. The attitude of Colombia turned American attention toward the less desirable Nicaragua route and later resulted in an unfortunate period of American-Colombian estrangement and the "economic" abolition of the American legation at Bogotá for several years before 1878, during which (in 1876) Colombia turned to the French for leadership in the canal enterprise. American interest in the problem was revived in 1879 by De Lesseps' suggestion of a joint international guarantee of neutrality for the canal, resulting (in 1880) in an executive declaration of American policy requiring American control of the canal. In 1881 Secretary Blaine initiated diplomatic measures to defeat the French enterprise by premature denouncement of plans for a European guarantee over the canal, efforts to establish closer relations with Latin America and fruitless negotiations with Great Britain for abrogation of the Clayton-Bulwer Treaty of 1850.

At the close of the Spanish-American War American interest in a canal at Panama was renewed and increased. In 1901 the first substantial step toward the realization of a canal under American control was taken in the negotiation of the Hay-Pauncefote Treaty, which terminated the Clayton-Bulwer Treaty. In 1902 the second step was taken by an act authorizing the purchase of the Panama franchise and unfinished work of the bankrupt French company. The third step—the completion of satisfactory arrangements with Colombia—proved more difficult and unfortunately resulted in strained relations with Colombia from 1903 to 1919. Colombia partly through German influence failed to ratify a convention of 22 Jan. 1903 by which the United States for \$10,000,000 and an annuity of \$250,000 (beginning 1913), obtained the right to construct the canal and to use and control the canal zone. Panama promptly declared independence from Colombia and was as promptly recognized by the United States which, on 18 Nov. 1903, negotiated with the new republic a treaty similar to that rejected by Colombia, recognizing American control over a canal zone 10 miles wide.

President Roosevelt, whose policy in Panama was generally approved, recognized that Colombia, in spite of her bad faith and her show of resentment against the United States, had a right in equity to compensation. In 1909 Secretary Root negotiated with the Colombian Minister the Root-Cortez Treaty, which provided for recognizing the independence of Panama by Colombia and payment of \$25,000,000 (in 10 annual installments) to Colombia by Panama. Colombia, refusing to ratify this treaty, proposed to refer the controversy to The Hague tribunal. The American government, declining this proposal, later made an amicable offer to pay an indemnity of \$10,000,000, which Colombia refused to accept. Finally, through instructions of Secretary Bryan, the American government authorized the negotiation of a treaty, signed at Bogotá on 7 April 1914, which expressed the regret of the United States for incidents disturbing the friendship of the two countries, favored Colombia by provisions for readjustment of the Panama bound-

ary and for certain commercial advantages and obligated the United States to pay to Colombia an indemnity of \$25,000,000. This treaty, ratified by the Colombian Senate, met strong opposition in the American Senate, which indefinitely postponed action, especially objecting to any expression which might imply a confession of improper policy in relation to the Panama revolution. Later, in July 1919, the Senate resumed consideration of the treaty without the objectionable clause. Meantime, a marked increase of friendly interest between the United States and South American countries followed an extensive tour of Secretary Elihu Root through those countries in 1906 and later visits of other American statesmen and other influential Americans who contributed much to the elimination of misunderstandings and prejudices and the consequent modification of opinions. In 1910 the American government used its good offices in joint action with Brazil and Argentina to settle a boundary dispute between Peru and Ecuador in a mediation which resulted in the submission of the controversy to The Hague. In 1912 its demand of 1909 upon Chile for settlement of the long-existing so-called Alsop claim of \$1,000,000 (arising in 1879 from the Chilean seizure of Bolivian territory upon which a Chilean firm with American members had a lien) was arbitrated by King George V whose award allowed about one-third of the original claim and apparently satisfied both Chilean and American governments. In 1909 it secured by mediation the settlement of a boundary dispute between Panama and Costa Rica. Its influence also restored amicable relations between Argentina and Bolivia. In 1914 it negotiated with Panama a new treaty by which it secured certain advantages, including control of the waters of Colón and Ancon, and surrendered the Savannah which gave Panama city direct communication with other territory of the republic.

In April 1914 in the serious Mexican situation which had resulted in severance of diplomatic relations with the United States, the ambassadors of Argentina, Brazil and Chile tendered their mediation, and later together with the ministers of Bolivia, Guatemala and Uruguay were called into consultation by the American government to aid in finding a solution to an embarrassing and dangerous difficulty.

Relations steadily improved during the period of the World War in which American example inspired increasing confidence throughout Latin America. In 1919 renewed efforts were taken to restore satisfactory relations with Colombia.

SOUTH BEND, Ind., city, county-seat of Saint Joseph County, on Saint Joseph's River near the source of the Kankakee River, and on the Lake Shore and Michigan Southern, the New Jersey, Indiana and Illinois, the Michigan Central, the Saint Joseph, South Bend and Southern, the Terre Haute and Indiana, the Pennsylvania and the Grand Trunk Western railroads, about 89 miles east of Chicago, 135 miles north of Indianapolis, and six miles south of the Michigan State boundary. It is connected by electric lines with Mishawaka, Elkhart, Goshen, La Porte, Michigan City, Valparaiso and New Carlisle, and Niles, Mich., all of which cities and towns contribute to the prosperity of South Bend. The census of 1910 gives the combined population of these places as 86,000. It was settled in 1824 by Alexis Coquillard. It is in the region traversed early by the missionaries and explorers. Across the northern portion of the city was the old portage from the Saint Joseph to the Kankakee. La Salle visited here in 1679 and later years as he journeyed from the "lakes" to the interior. He founded here an Indian village, the Miami tribe; but later the Pottawattomis occupied the place. It is in a fertile agricultural region in which stock-raising is given considerable attention.

Industries.—The city is the industrial centre for a large portion of Northern Indiana. Some of the manufactures are plows, wagons, automobiles and automobile bodies, clover hullers, woolen goods, paper, toys, shirts, sewing machine parts, blank-books, bicycles, baking powder, bluing, bank, bar and office furniture, beer, steam boilers, electrical appliances, street sprinklers, wood and paper boxes, brick, cement, brooms, confectionery, cigars, barrels, cultivators, cutlery, dowels, furniture, feed mills, flour, harness, harrows, machinery, ice, knit underwear, lumber, tombstones, mattresses, proprietary medicines, linseed oil, varnish, pulleys, rubber stamps, sash, blinds, doors, screens, seeders, sheet iron products, steel ranges, malleable steel castings, spark arresters, mineral waters, steel skeins, fishing tackle, indurated fibre goods, pharmaceutical goods for physicians, cigar boxes, electrotypes, grain drills, roofing, automobiles, watches, etc. Nearly all the South Bend factories work the entire year.

The government census of 1914 gives the number of manufacturing establishments 250, the amount of capital invested \$54,148,000, the number of employees in the manufactories, not including members of firms, 14,304, annual wages \$9,436,000, cost of material used annually \$12,742,000, value of products \$31,180,000. The capital invested in the carriage and wagon fac-

ories is about \$20,000,000, and the value of the annual output \$10,000,000. The output of the agricultural implements works is about \$3,500,000, and of the foundry and machine-shop products \$3,500,000. There are over 40 wholesale houses.

Buildings and Parks.—The principal public buildings are the government building, county courthouse and county jail (\$40,000), city hall \$75,000, Chamber of Commerce, Y. M. C. A. building, Saint Joseph's Hospital, Saint Anthony's Convent, the city hospital and two theatres. The public parks embrace 280 acres. There are four playgrounds, one 20-acre playfield and 13 social centres. The water supply comes largely from 62 artesian wells; there are about 100 miles of water mains.

Churches and Schools.—There are 44 church buildings and 51 church organizations, representing 18 different denominations. The educational institutions are one public high school, 18 public schools, 12 parish schools, Saint Aloysius and Saint Joseph's academies, conservatory of music, commercial schools, teachers' training school, historical society and a public library. Just outside the limits of the city, in the village of Notre Dame, are the large Roman Catholic schools, the University of Notre Dame (q.v.) for men and Saint Mary's College for women.

Banks and Banking.—The four national banks have a combined capital of \$500,000; the County Savings Bank has resources to the amount of \$4,500,000, deposits \$5,000,000 and a surplus of \$250,000. There are six building and loan associations.

Government and Population.—The government is administered under a special charter granted by the legislature which provides for a mayor and a council of 10 members. The members of the council hold office for a term of two years. There are about 20 nationalities represented in the city. The various industries and the good wages attract skilled workmen to South Bend. The principal nationalities, other than the English-speaking races, are Germans, Swedes, Poles, Belgians, Hungarians and Danes. Pop. 65,300.

SOUTH BERWICK, Me., town, York County, on the Salmon Falls River, and on the Boston and Maine Railroad, 40 miles southwest of Portland. Its chief manufacturing interests include shoe factories, cotton and woolen mills and carriage shops. The town has a public library and is the seat of Berwick Academy, a non-sectarian secondary school chartered in 1791. Pop. about 3,000.

SOUTH BETHLEHEM, bēth'lē-ēm, Pa., borough Northampton County, on the Lehigh Valley and the Philadelphia and Reading railroads, about 12 miles west of Easton, the county-seat, and about 40 miles, in direct line, north of Philadelphia. Electric railroads connect it with Allentown, Bethlehem and other places in the vicinity.

South Bethlehem was settled in 1741; but for many years it increased slowly in population and its industries were limited to local needs. Since 1850 the number and magnitude of the industries have increased and the borough has grown in proportion. It is in a manufacturing section, where iron ore deposits and coal fields are convenient and where there are

good transportation facilities. The chief industrial establishments are iron and steel works, machine shops, foundries, zinc and brass works, wood working factories, knitting mills, silk mills, coke works, ice plant, cigars and furniture works. The government census of 1914 gives the number of manufacturing establishments as 43, the amount of capital invested \$68,973,000, the number of employees, not owners 10,892, the total wages \$8,279,000, the cost of material used \$22,621,000, the value of the product, \$40,179,000. It ranks 19 in the State in the value of its manufactured products.

There are 21 churches, Saint Luke's Hospital and one home. The educational institutions are the Lehigh University, which has 15 large buildings, Bishopthorpe School, an institution for girls, a public high school, public and parish elementary schools and public and school libraries. Pop. 23,000.

SOUTH CAROLINA, a South Atlantic State of the United States of America, one of the original 13, and popularly called "The Palmetto State," lies between lat. $32^{\circ} 4' 30''$ and $35^{\circ} 12' N.$ and between long. $78^{\circ} 30'$ and $83^{\circ} 20' W.$ Its area is 30,989 square miles, of which 494 square miles is water. The State of North Carolina bounds it on the north; the Savannah River, the eighth river in length in North America, on the southwest and west; the Atlantic Ocean on the south, southeast and east forms the base of an irregularly shaped triangle with its apex resting on the Appalachian Mountains 200 miles to the north.

Topography.—*Coast Region.*—The coast region has an area of 1,700 square miles. The average elevation above sea-level is 10 to 15 feet, rarely 25 to 30. South of the Santee River the mainland is bordered by numerous islands, formed from the detritus brought down by the rivers and banked up south of their outlets by the currents and waves of the sea. They are fringed between high and low tide by salt marshes and extensive beds of oysters peculiar to this latitude. The mean rise of the tide in the Savannah River is 6.9 feet, and diminishes eastward to 3.5 feet at the Georgetown entrance. The tides push the fresh water of the streams before them on the flood, 15 to 30 miles inland, and render tide-water irrigation of the rice fields practicable. The salt water rivers separating the islands from each other and from the mainland furnish navigable waters for a length of 400 to 500 miles for steamboats and might, with little work, be converted into a continuous inside passage from one boundary of the State to the other.

The Lower Pine Belt.—Immediately north of the coast region the Lower Pine Belt, with a width varying from 20 to 70 miles, crosses the State from east to west, covering an area of 10,226 miles. These low-level lands bear a strong resemblance to those of the coast. The uplands, the so-called "pine barrens," represent the sea islands, the numerous large fresh-water rivers replace the salt rivers and arms of the sea, and the swamps, covering over 2,000 square miles, recall the salt marshes. Eight large rivers conveying all the rainfall of South Carolina, with a considerable portion of that from North Carolina and Georgia, together with several smaller rivers and innumerable lesser streams, traverse the region. The maximum

elevation, 134 feet, is reached at Branchville, making the fall to tide water in a direct line 2.8 feet per mile. In the extreme west the fall is greater, 5.8 feet a mile; in the Pee Dee section it is less than a foot to the mile. With proper engineering the fall is sufficient to drain the swamps and bring into cultivation what are perhaps the most fertile lands in the State.

The Upper Pine Belt.—The Upper Pine Belt, or central cotton region, lies north of the Lower Pine Belt and south of the Sand and Red Hill region. It covers 6,230 square miles. The elevation, 130 to 269 feet. There are extensive bodies of very fertile swamps in the rivers, subject, however, to occasional overflows, and back swamps equally fertile but needing drainage.

Sand and Red Hills.—A range of sand hills rises from the gentle slope of the Upper Pine Belt and attains an elevation of 500 to 826 feet. It is interrupted by hills and elevated levels of red clay lands. Its northern boundary is the "fall line" of the rivers. It covers 4,061 square miles. Extensive quarries of kaolin clay are worked here; works for the manufacture of porcelain ware from them have been successfully operated, and many thousand tons are annually shipped to the paper manufacturing. Fuller's earth is also found. A "cement gravel" has been much exploited for road material, being shipped by rail to distant points for that use. Roads covered a few inches with it become hard and withstand the weather and much travel. The long slopes of these hills face south, and the short slopes north. The latter are the most fertile. Besides rivers, the large clear swift running creeks, not counting smaller streams and branches, aggregate 1,100 miles in length. Their average fall is 15 to 20 feet to the mile.

Piedmont Region.—The average elevation is 700 feet, rising from 545 at Winnsboro to 989 feet at Greenville. It covers 10,245 square miles. Inexhaustible quantities of building granite of fine quality occur in Fairfield, Newberry, Kershaw and other counties. Mica slate is found in Abbeyville and Anderson. The peculiar soils known as the "flatwoods" of Abbeyville, and the "meadow lands" of Union, and also the "black jack flats" of Chester and York, are due to the weathering of extensive trap dikes in those localities. Lieber wrote in 1859, "above this line (the 'fall line') most streams have some gold in their sands." Thirty-one gold mines were opened in the talc slates of Chesterfield, Lancaster, Abbeyville and Edgefield counties. The Dorn Mine (now McCormick), in the last-named county, has yielded \$1,100,000. There were 19 gold mines in the mica slates of Spartanburg, Union and York counties. Gold production is about at its end, only \$3,789 worth being produced in 1915. Eight other, chiefly gravel, deposits, are in Greenville and Pickens counties. Argentiferous galena and copper are found in these mines, bismuth in quantity at Brewer Mine in Chesterfield County; iron in magnetic and specular ores in large quantity at Kings Mountain and elsewhere in Spartanburg and Union counties; limestone in York, Pickens, Spartanburg and Laurens; in the latter county there are quarries of marble; feldspar in Pickens, Abbeyville, Anderson and Laurens; barytes on the Air Line Railroad in York; manganese in abundance and purity at the Dorn

SOUTH CAROLINA. **Estimated population 1,625,475**

mine, and in Abbeyville, York and Pickens; asbestos in Spartanburg, Laurens, York, Anderson and Pickens; spinel rubies in Pickens; tourmaline in York, Edgefield and Laurens; beryl in Edgefield and Laurens; corundum in Laurens; zircons in Abbeyville and Anderson; one diamond has been taken from the itacolumite in Spartanburg.

Alpine Region.—The Alpine Region occupies the extreme northwestern corner of Carolina. It has an average elevation of 1,000 to 1,500 feet; Kings Mountain is 1,692 feet; Paris Mountain, 2,054 feet; Caesar's Head, 3,118 feet; and Mount Pinnacle, 3,426 feet. The mountains here often rise suddenly to their greatest height. The southeastern front of Kings Mountain is 500 feet in perpendicular height, Table Rock is 800 feet vertically above its southeastern terrace. The northwestern slopes descend gradually toward the Blue Ridge Mountains. There would seem to have been in ages past some great fault or land slip here, producing the long southeastern incline running down to the sea, and continuing under its waters for 100 miles to the Gulf Stream, where the 100-fathom depth suddenly sinks to 1,500 fathoms. The region covers 1,281 square miles.

Geology.—Sands, clays, soft limestones and marls more or less unconsolidated characterize the coastal region. They range from the Cretaceous to the Tertiary period. In the Lower Pine Belt outcrops of the Cretaceous rocks are noted in the extreme southeastern corner of the State, and have been traced northward to Mars Bluff and Darlington, where it passes under the Buhrstone of the Eocene. Superimposed on these Cretaceous marls are the Santee marls. They belong to the Eocene and are composed of corals and gigantic oyster shells. Just above tide-water they pass under the Ashley and Cooper marls, composed of many-chambered cells (Foraminifera), sometimes of so fine and compact a structure as to fit them for building purposes. Fragments broken from these marls and rounded by wave action form the phosphate rock of commerce. These nodules contain 55 to 61 per cent of phosphate of lime and have been quarried at the depth of one to six feet; they are also found on the bottom of the rivers, and on sea bottoms from North Carolina to Florida. The remains of the mastodon, elephant, tapir, horse, etc., are found mingled with them. Green sands containing 4 to 6 per cent of potash in the form of glauconite also occur here. A sandy loam overlays the Santee (Eocene) marls of the Upper Pine Belt. In the northern portion these marls have been petrified and converted into Buhrstone. In the eastern part of the belt are outcrops of the Cretaceous, and occasional islands of Miocene marls. In the Sand and Red Hills region no lime occurs, the Eocene marls having been converted into Buhrstone. The formations bear evidence of being littoral. Beds of lignite occur in Aiken and Chesterfield; kaolin and other commercial clays abound in this region. Above the "fall line" the rocks of the Piedmont country occur in the following order of superposition. On granite rests the gneiss, above them occur islands of greater or less extent of mica talc and clay slates, itacolumite and limestones, left from the denudation to which the region has been subjected for ages.

The rocks and minerals of the Alpine region correspond with those of the Piedmont.

Hydrography.—Three considerable river systems take their rise in these mountains, and make their way southwardly to the sea. The eastern watershed of the Savannah is narrow, as is also the western watershed of the Pee Dee. The intermediate space occupying the larger portion of upper Carolina is crossed by seven rivers, the Saluda, Tyger, Reedy, Pacolet, Broad, Catawba, Wateree, with their numerous affluents uniting to form the Santee River. A line across the State from Augusta, Ga., to Columbia and thence to Cheraw in the east, is known as the "fall line." On crossing this line the streams pass from the crystalline rocks, the granites and slates of upper Carolina, into the softer strata of the tertiary marls of the low country. Above the "fall line" the average slope of the streams is five feet to the mile, and they are available for the development of water powers to an extent estimated at 1,000,000 horse power. Below the fall eight other rivers, the North and the South Edisto, the Combahee, the Coosawhatchie, Black River, Cooper, Ashley, Waccamaw, are found with a fall of one to one and one-half feet to the mile. The numerous creeks, however, that feed these rivers, rising themselves in the elevation of the Sand Hills and Red Hills, have a much more rapid fall. Horse Creek, for instance, emptying into the Savannah below Augusta, furnishes in the length of 10 miles power for the Vacluse, Graniteville, Langley, Aiken and Clearwater factories, without being fully utilized. The rivers are navigable to the "fall line" for steamboats not exceeding 200 tons burden, and in all there is from 700 to 800 miles of navigation above tidewater.

Flora.—The palmetto and the live oak characterize the growth of the coast region, which also produces oranges of superior quality and figs in great abundance. Magnolias also abound from the coast to some distance inland. The swamps are characterized by cypresses, gums and bay trees. The long-leaf pine, water oaks and hickories are common on the uplands near the coast. Hard woods are predominant on the Piedmont plateau; deciduous oaks are most common, but birch, beech, ash, black walnut, maple, sycamore, chestnut and tulips are also plentiful. The mountains have cucumber trees, hemlock, white pine and laurel. Among indigenous species of economic importance are the grape, blackberry, pawpaw, plum, persimmon, crabapple, hazel nut, walnut, pecan, apricot, cherry and pear. Ginseng, bloodroot, horehound, redroot, horsemint, wild flax are the commonest medicinal plants, while the flowering varieties are represented by the lilies, roses, violet, golden rod, woodbine, azaleas and jessamines.

Fauna.—Deer, rabbits, squirrels, muskrats, raccoons, opossums, minks, ducks, wild turkeys, quail, snipe and woodcock are the best represented of the animals and birds. Foxes, bears, wolves, wildcats are now rare, while within memory panthers have become extinct. There are several varieties of songbirds, including all ordinary varieties. In the bays and rivers are porpoises, whiting, bluefish, seabass, shad, sturgeon, mullet, snappers, sheephead, weakfish, oysters, shrimps and terrapins. In the upper

courses of the rivers are catfish, pike, perch and trout.

Climate.—The mean annual temperature in the coast region is 63° to 65° F.; summer mean, 74° to 79°; winter 54° to 56°; rainfall, 50 to 80 inches. In the Sand and Red Hills region the climate is dry, but it enjoys an abundant rainfall and is well watered. The Alpine region has a distinctly salubrious climate. The highest mean temperature (for a week) ever recorded there was 90° F.; the lowest was 25° F. The mean annual temperature there is from 55° to 58° F. The rainfall is heavy, dewless nights are rare and vegetation is in consequence luxuriant. The mean annual temperature for the whole State is about 62° F.; the mean summer temperature, 79° F., and the mean winter temperature 44° F. The mean annual rainfall is 49 inches; it is well distributed and about 17 inches falls during the summer or growing season. Snow is uncommon in the southern part of the State and usually melts as it falls, but in the north snowfalls of several inches are not uncommon. Tornadoes sometimes sweep over the western part, while at intervals hurricanes from the West Indies ravage the eastern part of the State.

Soils.—In the Piedmont plateau the soil is a mixture of sand and clay, the result of the disintegration of the rocks of the region. On the hillsides of the river basins is the type of soil which is most common in the State, the deep red clay. The upper part of the coastal plain has a poor, sandy soil of little fertility, but the lower part has a finer sand which is much more fertile. Along the rivers and about the Sea Islands are the swamp muck and clay soils of great fertility.

Mineral Industry.—The minerals worked are phosphate rock, which is found in a belt of about 70 miles from the mouth of the Broad River to the headwaters of the Wando, in Berkeley, Dorchester, Charleston, Colleton and Beaufort counties. In 1915, 83,460 long tons (2,240 pounds), valued at \$310,850, were mined. The production is declining in South Carolina. Granite in 1915 was produced to the value of \$321,612 and clay products (brick and "paper clays") to the value of \$379,133. Gold production, once important, has now practically ceased. In 1915 only 183 fine ounces (\$3,789) were produced. The State produces also silver, manganese, iron, lime and monazite in small quantities. The value of the total mineral output (including coal products, sand, etc.) was \$1,129,709 in 1915 and \$1,414,249 in 1914.

Agriculture.—The settlers in Carolina soon ascertained that its soil and climate were suitable for all the plants of the Old World growing from the subtropical to the subarctic regions, besides a most varied flora of its own. They found also extensive pastures supporting numerous herds of wild buffalo, elk and deer. The horses and cattle introduced by the Spaniards increased rapidly in numbers. It might have been thought that here were elements favorable for a diversified husbandry. The colonists, however, discovered an agricultural monopoly and an export "money crop" in rice. It required capital for drainage and irrigation and a thoroughly organized and reliable labor able to resist the malarial influences of the rice swamps. Negro slaves fulfilled these conditions. English merchants furnished the negroes

and supplies on credit. The English Parliament favored the exportation of rice and it became a most profitable crop. When cotton was introduced in the 18th century, as it grew on healthy uplands, and did not require much capital, it was suspected that the small white farmer would undertake its culture. The small farmers, however, did not, except as overseers, take to cotton planting until after the emancipation of the slaves. The small farmers of both races modeled themselves after the methods of an agriculture that had been successful for nearly two centuries. They confined their energies largely to one "money crop" for export. They worked at it with hired labor, on borrowed money, purchased instead of breeding work animals, bought a notable portion of their supplies and largely of fertilizers.

The Lien Law securing the collection of advances made on growing crops, often even before they were planted, and the Lien Law requiring the enclosure of all livestock, leaving lands under crops unenclosed, promoted existing tendencies in agriculture. Removing the cost of fencing on lands under crops led to a wide deforestation and careless cultivation.

In 1880 there were 93,864 farms in the State containing 13,457,613 acres, of which only 4,132 acres were improved. In 1890 the number of farms had increased to 115,008, with 13,985,014 acres, of which 5,755,741 acres were improved. There are now (1919) 176,434 farms in the State, covering an area of 13,512,028 acres, of which 6,097,999 acres are improved. Farm property, machinery and livestock had a total value of \$84,079,702 in 1880. This value is now well over \$400,000,000. About 68 per cent of the area of the State is woodland. The chief cereal crops in 1918 with their acreage and production were: wheat, 205,000 acres, 2,225,000 bushels, valued at \$5,863,000; maize, 2,250,000 acres, 38,250,000 bushels, valued at \$74,588,000; oats, 500,000 acres, 11,000,000 bushels, valued at \$12,980,000; rice, 4,500 acres, 104,000 bushels, value \$203,000. Of greater importance in the agricultural life of the State is the cotton crop, to which 3,047,000 acres were planted in 1918, producing 1,500,000 bales of upland variety, valued at \$20,700,000. Tobacco in the same year was planted in 86,400 acres and yielded 62,208,000 pounds, valued at \$18,662,000. The hay crop of 1918 was taken from 260,000 acres, yielded 286,000 tons, valued at \$7,465,000. Peanuts were planted on 14,000 acres, yielded 630,000 bushels, valued at \$1,840,000. About 80,000 acres were planted to sweet potatoes, of which 7,600,000 bushels were produced, valued at \$10,792,000. Potatoes were planted on 28,000 acres, yielded 2,856,000 bushels, valued at \$5,512,000. The farm animals in the State 1 Jan. 1919 were 82,000 horses, 194,000 mules, 203,000 milch cows, 244,000 other cattle, 29,000 sheep and 1,056,000 swine. The value of these livestock was \$76,577,000.

More than 50 per cent of the farms are negro farms; about 25 per cent of the negro farmers are owners, 50 per cent cash tenants and 25 per cent share tenants. A higher percentage of white farmers are owners. Poultry products amounted to about \$2,000,000 in 1918. Honey and beeswax were produced in the same year to the value of \$80,000.

Fisheries.—The State has active fisheries, mainly oysters, whiting, shad and sea-bass. The

industry gives employment to about 3,000 persons and has an invested capital of \$125,000. The annual catch rarely exceeds \$300,000 in value.

Forest Products.—Yellow pine, also called Southern pine, is the chief lumber resource of the State. The stand of this wood alone is estimated at 3,000 million feet. It is being depleted at a rapid rate. There are about 450 mills which cut about 750,000 M. F. B. per year. The value of all forest products in 1918 was over \$5,000,000. Cypress, oak, locust and other pines are also being exploited.

Manufactures.—Antedating the establishment of the Patent Office by more than a century, the colonial assembly in 1691 passed an act "for rewarding ingenious and industrious persons to essay such machines as may conduce to the better propagation of the produce of this State." In 1778 tide water power was for the first time utilized in milling for cleaning rice. The machinery of these mills is the model on which this industry (performed before by hand) has since been conducted. A cotton factory was established in 1784 at Murray's Ferry, Williamsburg, and one at Statesburg a few years later. The first saw gin—patented by Ogden Holmes and serving as the type of all the short staple cotton gins of the South ever since—was erected in 1795 on Mill Creek, Fairfield County. Mills in the statistics of South Carolina, 1826, states that Mr. Waring operated a small cottonseed-oil mill at Columbia and "expressed from cotton seed a very good oil." In addition to this the improved gins operated at these mills have greatly cheapened the cost of ginning, which, together with high prices paid for seed, adds a few cents per pound to the value of lint cotton. The oil is a good edible oil and the by-products, meal and hulls are the cheapest form of stock food and fertilizer.

The manufactured products of South Carolina, as reported by the recent industrial census, were valued at \$138,891,202; its factories gave employment to 71,914 wage-earners, who received \$24,173,101 for their services. The capital invested in industry amounted to \$203,210,875, the cost of materials was \$91,008,196, leaving the value added by manufacture \$47,882,208. The State ranked 31st in the value of products and 25th in the number of wage-earners employed in manufactures.

The manufacture of cotton goods is the most important manufacturing industry. It gives employment to 64.6 per cent of all wage-earners and its products form 56.5 per cent of the total for all industries. There are only two States—Massachusetts and North Carolina—that exceed this State in the value of cotton manufactures. There are in operation 4,327,178 spindles, or 13.7 per cent of the total in the United States. The industry is fostered by the great cotton crop of the State. Oil, cottonseed and cake extracting is the second industry and is of course a by-product of the cotton growing and cotton spinning and ginning industries. Fertilizer manufacture is also important.

Of the wage-earners 82.5 per cent are 16 years of age and over, and of this number 19.6 per cent were females. The turpentine and resin industries are declining owing to the exhaustion of suitable timber.

The relative importance of the leading manufacturing industries is shown in the following table:

INDUSTRY	Number of establishments	Average number of wage-earners	Value of products
Cotton goods.....	148	46,448	\$78,446,145
Oil, cottonseed and cake...	97	2,037	16,379,858
Fertilizers.....	55	2,050	13,824,659

Communications.—The Savannah River is an important trade and travel route. Improvements have rendered it navigable for over 200 miles, from Savannah to Augusta, Ga. The Waccaman is navigable for 50 miles; the Great Pee Dee for 52 miles; the Cooper for 30 miles and the Edisto for 260 miles, while several other streams are navigable for distances up to 13 miles. Charleston, Beaufort and Georgetown are ports of entry. The length of steam railways in the State is 3,824 miles (144 miles of double track) and 113 miles of electric railway. The chief roads traversing the State are the Southern (1,200 miles), the Atlantic Coast Line (880 miles) and the Seaboard Air Line (370 miles). The assessed value of the railroads is \$45,816,096.

Banks and Banking.—A State bank of South Carolina was established in 1812 and was entirely under State control. It was the repository for all State funds. It went into liquidation during the Reconstruction period. There are now within the State 55 national banks, capitalized at \$7,500,000 and with \$22,000,000 on deposit; 285 State banks, capitalized at \$10,500,000 and with \$10,000,000 on deposit and \$50,000,000 on loan; 28 savings banks, with 36,398 depositors, who have to their credit \$9,676,647, or \$265.05 to each depositor.

Constitution and Government.—From 1670 to 1719 South Carolina was governed under the Carolina provincial charter of 1665. From 1719 to the period of the Revolution it was governed mostly by Crown commission. In 1776, 1778, 1790, 1865, 1868 and 1895 constitutions were adopted. That of the last-named year has since been several times amended. A constitutional amendment may originate in either house of the legislature; if carried by a

two-thirds vote in both houses it is submitted to the people at the next election following when a favorable majority sends it back to both houses, where it is again put to a vote. A majority vote of both houses is this time sufficient to make it part of the constitution. The two first steps above given for an amendment are also required to call a convention for the revision of the constitution. A negro majority is carefully guarded against by the constitutional provisions that voters applying for registration after 1898 must be able to read and write any section of the State constitution or must show that they have paid all taxes for the previous year on property appraised at \$300 or over. This provision effectively bars illiterate negroes from voting and also all negroes who do not own real or other property assessed by the State at \$300 or over. A residence of two years in the State is required for voting.

Executive.—The governor holds office for two years, is paid \$3,000 and is eligible to succeed himself. He must be 30 years old, as also the lieutenant-governor, and both must be residents of the State for five years. Other executive officers are the secretary of state, comptroller, state superintendent of education, treasurer, commissioner of agriculture, commerce and industry and the attorney-general. All executive officers are elected for a term of two years and at the same time as the governor.

Legislative.—The State legislature is known as the general assembly. It is composed of a senate of 44 members, elected for four years (half retiring biennially), and a house of representatives of 124 members, elected for two years. Annual sessions are held beginning on the second Tuesday of January.

Judiciary.—The judicial power is vested in a Supreme Court, two Circuit Courts, a Court of Common Pleas with civil jurisdiction and a Court of General Sessions. The Supreme Court has a chief justice and four associates, elected by the general assembly for 10 years. The eight circuit justices are elected by the same body but for a four-year term. Justices of the peace are appointed by the governor.

Local Government.—The county is the unit of local government. It must contain at least one one hundred and twenty-fourth of the population of the State, have property assessed at \$1,500,000 or over and be at least 400 miles in extent. The local electors must sanction all civic incorporation by a two-thirds vote.

Miscellaneous Laws and Provisions.—A provision of the constitution is aimed to prevent lynching, by providing for the removal from office of any officer who permits a prisoner to be seized and lynched, and by making such officer ineligible to hold any office of trust in the State. The county where the lynching occurs is liable in damages of not less than \$2,000 to the legal representatives of the person lynched. Divorce is not allowed in any circumstances. Hours of labor in cotton and woolen mills are limited to 60 per week, with certain exceptions. No one may hold office under the constitution who denies the existence of the Supreme Being.

Finances.—The State derives its revenue from the general property tax, fees, licenses, phosphate royalties, etc. On 1 Jan. 1918 the balance on hand in the State treasury amounted

to \$963,089; the receipts in 1918 totaled \$5,760,234. The expenditures in 1918 amounted to \$5,904,786, leaving an unexpended balance on 1 Jan. 1919 of \$818,537. On 1 Jan. 1919 the outstanding debt amounted to \$5,391,320. The assessed value of real property in 1918 was \$208,348,279; of personal property, \$113,745,256.

Education.—School attendance is not compulsory, but there are certain restrictions on the employment of illiterate children in factories or mines. There are separate schools for white and colored children. There are 14,919 public schools in the State with 407,940 enrolled pupils and 8,680 teachers. The 149 public high schools have 427 teachers and over 8,000 pupils. For the training of teachers there is one public normal school with 67 teachers and 974 students. For higher instruction there is the University of South Carolina, founded at Columbia in 1805, with 43 professors and 385 students. Clemson Agricultural College has 71 professors and 840 students. Allen University (African Methodist Episcopal) for colored students has 17 professors and 631 students. Other higher institutions are Charleston City College, Erskine College (A. R. Presbyt.) and Wofford College (M. E. So.), at Spartanburg. There are several smaller denominational colleges and also eight colleges for women. There is also a college for colored youths, a military academy and a normal and industrial college. The expenditures on public school education in 1917 was \$3,887,295.

The State has a higher percentage of illiterates than all other States except Louisiana. Of the total population of 10 years of age or over 25.7 per cent were returned as illiterate at the last census. Among whites the percentage of native parentage the percentage of illiteracy was 10.5; among negroes, 38.7. The State educational system is ruled by a State Board of Education, under which are county superintendents, county boards and county supervisors.

Population.—On 1 July 1918 the population was estimated at 1,660,934. In 1910 there were 679,557 whites, 835,843 negroes, 65 Asiatics and 331 Indians. The foreign-born population was 6,179, of whom 1,744 were German, 786 Russian, 767 Irish and 517 English. Large towns are Charleston with an estimated population of 61,041; Columbia, the State capital, 35,165; Spartanburg, 21,985, and Greenville, 18,574. There were 335,046 males of voting age in 1910 and of these 165,769 were whites.

Religion.—The last religious census returned 655,933 members of different religious denominations; the Baptists being strongest with 341,456 members, the Methodists next with 249,169. There were 35,533 Presbyterians, 12,652 Lutherans, 10,317 Roman Catholics and 8,557 Episcopalians.

Charities and Corrections.—The State maintains several charitable institutions, including a hospital for the insane at Columbia and an asylum for the deaf, dumb and blind. There are besides 9 orphanages, 10 hospitals and 10 homes for adults and children maintained mainly by private charity. A State Board of Charities and Correction was created in 1915. There is a State penitentiary at Columbia, where there is also a reformatory for negro boys. A State farm is located at Boykin and an industrial school at Florence.

History.—The first settlement on the continent of North America took place 27 May 1562 on the southeastern extremity of Paris Island in Port Royal Harbor. A colony of French Huguenots landed there and built a fort, naming it in honor of their king, Charles IX, Carolina (aboriginal name, Chicora). Their ships having returned to France for reinforcements, a fire broke out, which destroyed their barracks and magazine. In this plight they constructed boats, with the assistance of the Indians, and went back to France. In 1665–69 Charles II, of England, claiming Carolina by reason of the discovery of North America by John Cabot, in 1497, when sailing under a patent from Henry VII, granted all that "tract of ground" in America between the 36th degree and 31st degree north latitude, and to the west as far as the South Seas (Pacific Ocean) to eight English noblemen as Lords Proprietors. The grant covered about 1,020,000 square miles or more than one-third the area of the present United States, a region since largely peopled from the South Carolina of to-day. The first colony sent out landed in 1670, as the French had, at Port Royal, but removed shortly after to the confluence of the Ashley and Copper rivers, where they founded the city of Charleston. The Proprietary government was conducted under a royal charter and certain "Fundamental Constitutions" drawn for that purpose by the famous metaphysician, John Locke. In order to avoid "erecting a too numerous democracy" Locke designed a territorial aristocracy of land-graves, caciques and barons. The colonists, however, insisting upon the clause of the king's charter directing the Lords Proprietors to "govern according to their best discretion by and with the advice, assent and approbation of the Freemen of said territory, or their deputies or delegates," prevented from first to last this aristocracy from taking root in the colony. The Proprietary government, without adaptability to the circumstances and necessities of the colony, promoted endless discussions and dissensions as to the interpretation of the charter and the "Constitutions." A succession of "heats and broils" during 49 years culminated in 1719. The Proprietors expressed their inability to aid the colonists, refused petitions addressed to them on important matters and repealed acts of the assembly laying taxes for the discharge of the public debt and for the freedom of elections. The assembly thereupon voted itself a convention and unintimidated by the threat of the Proprietary governor to bombard Charleston from a British war vessel, elected James Moore governor in the name of the king, and the Royal Government of the Province supplanted that of the Proprietors.

Bancroft and Dana place the highest estimate of the aborigines south of the Great Lakes and east of the Mississippi River at 180,000, or one person to four and one-half square miles, a territory now supporting a population of 67 to the square mile, or 301 for one Indian. John Lawson 1703 and Governor Glen in 1743 agree in estimating the Indian population of Carolina at about one to eight square miles. They were generally friendly to the colonists except when incited to sudden outbursts of hostility by the Spaniards, the French or the British, and formed a more or less important contingent

in war, as when James Moore in 1702–03 invaded the Appalachian region with 25 whites and 1,000 Indians and returned with 1,300 captives, who were sold into slavery to the northern colonies and the West Indies.

Negro slaves were introduced from the Barbadoes in 1671 and were counted to be 12,000 in number at the close of the Proprietary rule in 1720. They were instructed in the Christian religion and some of them taught to read. It was required of each white militia man that he should train and arm a negro to accompany him in war. The white population had increased from 391 in 1671 to 9,000 in 1720, living chiefly in proximity to Charleston. While the Indians lived principally on game and fish, cultivating only two plants, corn and tobacco, both exotics, the white colony never suffered for subsistence. They got 30 to 80 bushels of corn from an acre, deer supplying meat; an Indian hunter would for \$25 a year furnish a family with 100 to 200 deer, besides wild turkey, fish, etc. The culture of rice was introduced in 1693 and the export of this cereal in 1720 amounted in value to £3,350 sterling. The Proprietors refused in 1674 to send out cattle to the colonists, saying they wanted them to be "planters and not graziers," but seven years later they had so increased that many planters had 700 to 800 head. The assembly had to appoint commissioners to dispose of unmarked animals, and passed a law for the enclosure of crops, which remained in force until 1882.

As early as 1700 Charleston had a large and lucrative trade with the Indians in furs and hides, extending 1,000 miles into the interior, and a large export trade in forest products, timber, pitch, turpentine and provisions to the northern colonies and the West Indies. Religious freedom was secured, while the ministers of the Church of England were supported from the public funds. The various Church members stood as follows: Episcopalians, 42 per cent; Presbyterians and Huguenots, 45 per cent; Baptists, 10 per cent; Quakers, 3 per cent. A free public library was established in Charleston in 1700 and a free school in 1710. In 1712 a digest of the English and colonial laws was prepared by Chief Justice Trott. In 1717 a successful war was waged against the pirates infesting Cape Fear and a number of them captured and executed. A duty of £30 a head was laid on the importation of negroes.

George I and George II were nursing fathers to Carolina. The assembly was convened, all actions at law on account of the change of government were declared void and the judicial proceedings under the provisional administration confirmed. Treaties were made with the Indians, who had hitherto stood as independent neighbors and were now constituted allies or subjects. Parishes were laid out and whenever settled by 100 families, they were allowed representation in the assembly. To relieve the burden on the country people of repairing for the trial of all causes to the general court at Charleston, county and precinct courts were established. Schools were established in each precinct and £25 levied by the justices to assist in the yearly support of the teachers, who were required to teach 10 poor children free of charge. Between 1733 and 1774, over 200 tutors,

schoolmasters or schoolmistresses, were engaged in the province. The king having bought out the Proprietors for £17,500 purchased also the quitrents due them by the colonists and remitted them. Charleston was the extreme southwestern outpost of the British in America. As late as 1741, when the Spanish possessions lay embosomed on the Gulf of Mexico, with Saint Augustine, the oldest fortified place in America, the French claimed all the territory lying west of a line starting from a point north of Charleston, reaching the Appalachian Mountains, running round the headwaters of the Potomac, across the Mohawk and Hudson, down Lake Champlain and by the Sorel River to the Saint Lawrence. With little aid from the mother country, the colonists had stood as the advance guard against the warring Europeans and held in check the American savages, the African savages imposed upon them, and the pirates. The first settlers had confined themselves to the neighborhood of Charleston. Now the settlement of Georgia, 1732-34, protected the Western frontier and the interior of Carolina, received many immigrants, Germans, and after Culloden many Scotch came into the middle section, and, on Braddock's defeat, refugees from Virginia and Pennsylvania followed in the Piedmont region. Land was granted free of charge for 10 years and after that the annual rental was four shillings sterling for 100 acres. Great Britain imposed restrictions on the commerce and domestic manufactures of her colonies. While this was prejudicial to the more northern colonies, it did not affect an agricultural people like the Carolinians. The restraint imposed by the navigation acts on colonial exports was removed on the export of Carolina rice. The exports of rice and indigo reached £108,750 in 1747. In 1775 the exports of these two commodities alone were valued at £1,000,000 sterling, a third of what the entire trade of the American colonies was estimated at in 1768. Between 1725 and 1775 the population increased sevenfold. In 1773 Josiah Quincy, writing from Charleston, says of the city: "In grandeur, splendor of buildings, equipages, commerce, number of shipping, and, indeed, in almost everything, it far surpasses all I ever saw or expected to see in America." With the most sincere and loyal attachment to Great Britain, the king and his government, the Carolinians sent their children to England and Scotland to be educated and spoke of the mother country as "home."

In the midst of this prosperity Carolina was led, step by step, during a period of 11 years, through sympathy with the northern colonies for injuries inflicted on them, to take part against the enforcement by Great Britain of taxation without representation, without desiring or anticipating the separation from that country, which finally took place. On 28 June 1776, while the congress of the colonies was discussing the Declaration of Independence, Colonel Moultrie, from the Palmetto Fort on Sullivan's Island, repulsed with heavy loss the English fleet and turned back the expedition of Sir Henry Clinton for the invasion and subjugation of the South. In the same year Carolina was the first colony to frame and adopt an independent constitution, but with the proviso that this constitution is but temporary

"until an accommodation of the unhappy differences between the colonies and Great Britain can be obtained."

In 1778 John Rutledge, governor of the State, declared "such an accommodation, an event as desirable now as it ever was." The material injuries to Carolina by the Stamp Act, the duty on tea and the other acts of the government of George III were slight as compared with the advantages she enjoyed under English rule, but she had enlisted in no lukewarm manner in the struggle on account of the principles of right and justice involved. It was not until after the fall of Charleston in 1780, when the State lay prostrate, that the outrages of the British armies roused to resistance the population from the seaboard to the mountains. They then flocked to the standards of the partisan leaders, Marion, Sumter, Pickens and others, and so harassed and delayed the northward movement of Cornwallis to join Clinton that Washington and Lafayette were enabled to unite in Virginia and force the British into Yorktown. There, blockaded by the French fleet under DeGrasse, they were compelled to surrender and the war virtually terminated in favor of the Americans. Carolina contributed \$1,205,978 above her quota to this war—only a few thousands less than Massachusetts, whose war the Revolution was, and who never suffered from invasion—and more than all the other 11 colonies together. One hundred and thirty-seven engagements with the British took place within her borders. In 103 Carolinians alone fought, in 20 others she had assistance and 14, including Camden, were fought by troops from other colonies. "Left mainly to her own resources," says Bancroft, "it was through the depths of wretchedness that her sons were to bring her back to her place in the republic after suffering more, daring more, and achieving more than the men of any other State."

The eight years of war were followed by eight years of distress and disorganization. The country had been laid waste, churches burned and industries paralyzed. It was estimated that the British had kidnapped 25,000 slaves and sold them. They plundered the planters' homes. Bancroft says they pillaged of plate alone to the value of £300,000. After the fall of Charleston there arose a 14-years' dispute between the army and navy engaged in the siege as to their respective shares of the plunder. On 9 Aug. 1787 Carolina ceded to the United States her lands (10,000 square miles), not lying within her present boundaries. On 17 September of the same year she ratified the Constitution of the United States. In 1790 the seat of government was removed from Charleston to Columbia, in the the centre of the State, and another constitution substituted for that of 1776. An amendment in 1808 fixed the number of representatives at 124, allowing one representative for each 62d part of the white inhabitants and one for each 62d part of the taxes raised by the legislature. The senate was to be composed of one member from each election district, except Charleston, which was allowed two. This accentuated the differences already existing between the peoples of the lower and the upper country. The former, being the outgrowth of the city life of Charleston and the

first settlers, preponderated in wealth. The other, arising from numerous and separate centres of rural settlement, had the larger and more rapidly increasing number of white inhabitants.

The first Tariff Act of 1789 imposed an ad valorem duty of 5 per cent on imports (with a few specific duties of 15 per cent) for the support of the Federal government. This was in addition to the taxes raised by each State for its own purposes. It was much higher taxation than under the colonial government, which required in ordinary times only a duty of 3 per cent on imports, with an export duty of 3d. on hides. Four years later the tariff was raised to 10 and 20 per cent. Ten years after, duties were increased $2\frac{1}{2}$ per cent in aid of the Mediterranean Fund against the Barbary Powers. Double war duties, amounting to 25 to 40 per cent, were imposed in 1812. In 1816 a tariff protecting the industries, that had been found necessary but deficient during the late war, fixed duties at 25 per cent, to be reduced to 20 per cent in 1820. The Carolina representatives supported this not unreasonable protection. The reduction never took place, and at this the Carolina representatives protested. Disregarding their protest, a tariff imposing 12 to 50 per cent duties was passed in 1824. Again, in 1828, without regard to the complaints of the Carolina farmers, who were being forced to contribute to the manufacturing profits of other States, a tariff raising duties 25 to 50 per cent was enacted. Wearied with unavailing remonstrance, a convention of the people of Carolina was called in 1832, which declared the protective tariff law unconstitutional, null and void. To meet this action of the State, Congress passed the Force Bill in 1833 for the collection of customs. In the same month of the same year Congress passed "the Clay Compromise Act" for a gradual reduction of duties until 1842, when they should reach a 20 per cent level. This restored tranquillity, although for the second time the promised reduction was never fully realized.

Coincident with the tariff, another and more serious source of disturbance arose. In 1775 slavery extended over North America from Canada to Florida, inclusive. It had been introduced by Queen Elizabeth, and James II belonged to the Royal African Company for trading in negro slaves. Now it began to be looked upon with horror, as something strange and foreign to human instincts. The New England Anti-Slavery Society was formed in 1832. In less than four years more than 100,000 persons had joined anti-slavery societies in the Northern and Western States. They demanded of Congress that "all slaves should be instantly set free without compensation of the owners." They declared "we will give the Union for the abolition of slavery." The lesson was taught far and wide that the slaveholders of the South "a few arrogant domineering self-constituted aristocracy" were—through the representation allowed them "in proportion to the number of their slaves"—ruling the work-people of the North and denying their industries the protection due from the Federal government. They declared that "the country must become all free or all slave." The non-slaveholding whites of the South were as violently opposed to the

emancipation of the negroes as their brethren of the North were in favor of it. To them it meant industrial, political and social equality with a people in their midst whom they deemed inferior to themselves. They did not ask for aid to their industries through Federal taxation and did not see why Northern manufacturers should. After years of angry discussion along these lines the crisis came—during a period of unprecedented prosperity in Carolina—on the election by the Anti-Slavery party of a President in 1860 by less than a third of the popular vote. It found the peoples North and South solidly arrayed against each other with fatal unanimity. The "irrepressible conflict" burst into war. The North took the offensive for Federal domination and patronage and for race equality, freedom and fraternity. They were sustained by the popular sentiment of the European masses. South Carolina and the South rose to a man—with no sympathy or support from without—in defense of State autonomy and white supremacy. From an arms-bearing population of 55,046 in Carolina 44,000 volunteered (most of them not identified with the slave-holding class) in defense of the domestic institutions of the State, its sovereignty and free trade. Ultimately 71,088 were mustered in.

Poorly armed, poorly clad, poorly fed, practically without pay for more than four years they maintained their cause, losing in battle and by disease 15,638 of their number. The negroes, who, in earlier days, had been enticed away by promises from the Spaniards and had sometimes sided with the Tories and the British, remained as a rule loyal to their masters in this war, served their families and tilled their fields, while they were absent. The issue was decided by force of arms and numbers and was never submitted to legal adjudication. No indictments for treason, as is usual in rebellions, were made. An export duty was placed on cotton and import duties were increased by the national government. For 12 years negro supremacy was enforced in the State by the Federal army. When on 10 April 1877 the Federal guard filed out of the south door of the Capitol at Columbia the negro government collapsed without a struggle. The white citizens quietly resumed the administration of affairs. President Eliot of Harvard, in a speech before the Central Labor Union in Boston February 1904 on the world-wide conflict of labor and capital, sums up the result of this titanic struggle in these words: "How many things my generation thought were decided at Appomattox; but during the subsequent 40 years it has gradually appeared that hardly anything was settled there except the preservation of the unity of the National territory." For more than two centuries, under 10 written constitutions, the State had been governed by a more than usually centralized democracy. Opposing a similar centralization of functions by the Federal Union, the collision dispersed these functions into smaller and smaller civil divisions; counties, townships, school districts. The latter, restricted to an area of 9 to 40 square miles, were endowed with the sovereign power to lay taxes and incur debt. A centrifugal tendency is noticeable, also, in subdivision of farms, and in the establishment of cross-road stores and village banks.

After the withdrawal of troops by President Hayes the whites secured control and white supremacy has since been maintained. In 1886 a property loss of \$8,000,000 was caused by a severe earthquake centring about Charleston. Over 1,000 persons perished in a great storm along the coast in 1893. The gubernatorial contest of 1890 was most bitter between the so-called aristocrats and the plebs or Farmers' Alliance. The latter were victorious and elected their candidate, Ben Tillman, to the governorship. Liquor regulation and legislation caused serious political turmoil from 1893 to 1907 when the State liquor dispensaries were abolished because of charges of corruption. In 1910 Prohibition was a campaign issue and went down to defeat when Coleman L. Blease was elected governor. Blease was soon involved with the State Supreme Court over judicial nominations, refusing to commission any judicial appointees other than his personal friends. About 1911 the governor began to pardon convicts wholesale, and by the end of his second term had considerably depleted the prison population. He also exercised his veto to an extraordinary degree but very many acts were passed over his veto. Despite considerable opposition Blease was re-elected in 1912. On 11 Jan 1915 Blease disbanded the organized militia and resigned the following day. His successor reversed the order of disbandment. The State voted a majority for Prohibition in 1915. The State is strongly Democratic, having consistently voted a Democratic majority, except during the Reconstruction period, 1866-77, when Republicans were in power.

Population.—After the Revolutionary War the population of South Carolina was estimated at 104,000 for representation in the Federal Congress. In 1790 the State ranked seventh; it rose to sixth in 1800-10-20. The decline in rank commencing at the latter date has been continuous, and in 1910 the State ranked 26th. In 1790 the density per square mile was 8.3; in 1910 it was 49.7. The foreign-born population was only 4 per cent of the whole in 1900; at that date the State had lost to other States 233,300 persons born in its limits, and had received from all the others 55,216, making a net loss from interstate migration of 178,076. The population in 1910 was 1,515,400.

GOVERNORS OF SOUTH CAROLINA.

PROPRIETARY PERIOD, 1670-1719.

Sir John Yeamans	1665
William Sayle	1669-70
Joseph West (acting)	1670-72
Sir John Yeamans	1672-74
Joseph West	1674-82
Joseph Morton	1682-84
Richard Kyrie	1684

Editorial Staff of The Americana.

SOUTH CAROLINA INTER-STATE AND WEST INDIAN EXPOSITION, a commercial and industrial exhibition held at Charleston, S. C., from 1 Dec. 1901 to 1 May 1902, at which exhibits were made from nearly all the Southern States and from the West Indian Islands. The exposition showed the remarkable progress made by the South Atlantic States in commerce and industry since the

Civil War. The cost of the exposition was \$1,250,000, of which \$313,000 was covered by the receipts. The total attendance was 674,086.

SOUTH CAROLINA UNIVERSITY.

See **UNIVERSITY OF SOUTH CAROLINA.**

SOUTH DAKOTA, the "Sunshine State," one of the north central United States located west of Minnesota and Iowa, north of Nebraska and east of Wyoming. It lies chiefly between the 97th and 104th degrees of longitude and the 43d and 46th degrees of latitude. This gives it an area of 77,615 square miles, being 360 miles wide from east to west and about 225 miles from north to south. It is the 14th State of the Union in respect to area. The word Dakota is of Indian origin and means "leagued or allied."

Geology and Topography.—South Dakota has very great extremes of altitude and a great variety of topography. Big Stone Lake, in the northeastern part, is its lowest point. This is less than 1,000 feet above sea-level (967), while in the southwestern portion of the State, known as the "Black Hills," there are elevations which rise to over 7,000 feet. Harney Peak is given at 7,244 feet by best authorities. The surface also varies from that of level plains, which may be found in the James River Valley and along the Missouri, to high table-lands with gentle undulations, as east of the Missouri and in smaller areas on the summit of the Coteaus. Then there is a region of narrow cañons, hundreds of feet in depth, presenting on a smaller scale the wildness and picturesqueness of the Rocky Mountains, as Elk Creek and Spearfish cañons in the Black Hills and the rugged, craggy needles of Harney Peak and vicinity. There are areas in the State where you cannot find a stone the size of an egg for a score of square miles and other sections where rocks and stones may be found in great abundance—where erosion went on so continuously as to produce barren conditions. The Bad Lands of White River are a good illustration of this formation. The surface may be classified as follows: (1) The Black Hills: these are mountainous elevations—much eroded—dome-shaped peaks pushed up above the horizontal beds that cover the surrounding region (2) the Table Lands: these occupy the region just east of the Missouri chiefly and were formerly called by the French "Plateau du Coteau du Missouri"; (3) river valleys, including the present flood plains and also higher terraces, such as the Missouri River, which divides the State in nearly two equal parts, the Cheyenne, White, James and Sioux River valleys; (4) Bad Lands, a limited area in southwestern portion of the State, chiefly along the White River. This area has some unique characteristics. These several divisions require further description to be appreciated. The Black Hills district has an area of about 5,000 square miles and occupies a prominent position in the southwestern corner of the State. Their true limits are distinctly marked by a sharp ridge of sandstone from 300 to 600 feet in height. This ridge is separated from the higher mass of hills by a valley from one to three miles in width, known as Red Valley, so named by the Indians from the brick red soil found there.

From this valley one ascends gradually the outer slope of the hills proper and soon enters an altitude of 4,000 to 5,000 feet. This outer slope presents great variety of soil formation. It is underlaid by older sedimentary rocks cut in all directions by narrow and deep cañons. This feature applies to all the southwestern portion of the State. From the broken interior edge of this slope (this sedimentary plateau) one descends a bluff and enters a central area of slates-granite and quartzites formation. These are in many places carved into high ridges and sharp peaks cut by numerous narrow and deep valleys and ravines and with thickly-set Rocky Mountain pine timber. Toward the south of this elevated plateau Harney Peak rises to 7,244 feet above sea-level and toward the north Terry and Custer peaks attain quite an altitude and present a rugged and interesting surface.

The Table Lands correspond approximately to the early surface of the State. They slope from an altitude of about 3,500 feet along the western boundary eastward to an altitude of 2,000 feet near the northeast corner and to 1,450 feet near the southeast corner. This makes an average slope eastward of about four feet per mile along the northern boundary and less than six feet along the southern boundary. The highlands are eroded into undulations and traces are present of higher strata which every here and there stand out as buttes and ridges. The region which best illustrates this peculiarity is the northern part of that district lying west of the Missouri River. On the east side of the river these highlands are less prominent and yet may be readily located. The Bijou Hills, Wessington Hills, Ree Hills, etc., are all of this same formation as are the Choteau Creek Hills and Turkey Ridge in the southern portion of the State. There are three very important valleys crossing the State from north to south. These are the Missouri, the James and Big Sioux. The Minnesota also touches the northern portion of the State where it has an altitude of about 1,000 feet above the sea. The James River Valley is from 60 to 70 miles wide and from 1,200 feet high at about the northern boundary line to 100 feet at the southern line. It has five important branches. One extends west from Aberdeen at an altitude of about 1,500 feet, another west from Scotland and the fourth southeast from Marion. The fifth is northeast from Aberdeen and connects this James Valley with the Minnesota. All of these valleys have been very much eroded by glacial movements and are less sharply defined than are the valleys west of the Missouri River. The Missouri River Valley is very narrow, usually less than three miles in width in South Dakota. Its western tributaries are also marked by narrow cañon-like valleys. Examples of this are the Grand, the Cheyenne and White River cañons. Along all of these Western rivers may be found a similarity of formation quite unique and presenting many features of interest to the student of nature. On the extreme eastern side of the State, extending nearly the entire length of the same and forming for nearly 100 miles the eastern boundary, is the big Sioux River Valley. This embraces the best agricultural

soil in the State and is not surpassed in fertility by any State in the Union.

The Bad Lands.—These have become famous. Their features and treasures early attracted the hunter and the explorer. The term "bad" has been applied to them because of the difficulty of exploring that region. The most notable "bad lands," or *mauvaises terres* in the State are located between the Cheyenne and White rivers. This whole region is cut up by deep ravines, bounded largely with high continuous clay bluffs. Most of the surface is without useful vegetation. The peaks and bluffs seem to have been carved by erosion out of the white clays, marls and sands of the Tertiary Geological Period. The "Bad Lands" have become widely known, chiefly through the fossil remains they contain. The most fruitful field for this is what is known as Indian Draw, a south branch of the Cheyenne River. Here the stream has eroded a valley five or six miles in width, bounded by steep cliffs over 300 feet high. This valley is studded with an indescribable labyrinth of buttes, ravines, grassy valleys and dry water courses. Here the light colored clays of the Tertiary Period rest directly on the dark Cretaceous shales. In the lower strata of the Tertiary are to be found the best fossil remains. Many of these have found their way into our best European museums and are evidences of mammoth animals of various types that once inhabited the forests of the State.

Archæological Remains.—The State also contains interesting archæological remains. These indicate the occupancy of a prehistoric race of greater industry and intelligence than the Indians later encountered by the white man. One of these is the remains of a strong fort near Pierre. It embraces about 130 acres of ground, is admirably located for strategic purposes, is laid out with a skill and accuracy that challenges the admiration of modern military engineers. Within this are found remnants of pottery which give evidence of a high degree of skill and artistic sense. Copper instruments, highly tempered, are also found indicating an art now lost to man. The walls of the fortification are very heavy and well constructed, suggesting an industry and a skill never exhibited by any Indian tribes. There are similar fortifications at several other strategic points in the State, such as Chamberlain and Campbell County. Near old Fort Wadsworth, in Marshall County, are also extensive mounds which army engineers long ago pronounced must belong to a prehistoric race.

Climate and Rainfall.—The State is noted for its abundance of sunshine. The whole eastern slope of the Rocky Mountain Plateau is distinguished for its sunshine and South Dakota is known as the "Sunshine" State. No Northern State has fewer cloudy days. The air is dry in winter and a low temperature is endured without much suffering. The Chinook winds from the Pacific warm current modify the temperature very perceptibly, especially in the western part of the State. The temperatures vary from an average of 16° above zero for January (the coldest month) to an average of 72° for July (the warmest month). The growing season varies from 136 days in the Black Hills to 150 days in the southeastern

part of the State. The moisture comes principally from the Gulf of Mexico and the Atlantic Ocean and is abundant for agricultural purposes over nearly all the cultivated section of the State. The annual rainfall in the eastern half of the State averages little more than 22 inches and in the western half 17 inches. The summer rainfall averages about 15 inches for the entire State during the growing season.

Agriculture.—The chief industry of South Dakota is agriculture, except in the southwestern portion of the State, where there are extensive gold mines and where mining is the only occupation of importance. The broad fertile prairies are fast being converted into rich fields of various food crops. One can drive for miles with waving fields of grain on both sides of the road as far as his eye will carry and of corn also hedging the way with its green cooling foliage to soften and reduce the sun's heat on July and August days. All varieties of small grain are grown successfully over almost the entire State. Corn is grown best in the Southern and Eastern portions. Yet in the Central part its yield is increasing each year.

Soil cultivation is becoming more general the last decade than ever before. Considerable fall wheat is now sown but spring sowing is still the most common practice. Crop rotation too is just receiving attention and will soon become general for this method is advocated from every source of reliable information. Irrigation is practised to some extent, especially in the northwestern part of the State and its advantages are coming to be appreciated more and more each year. The Federal government has constructed a large dam on the Bellefourche River and this irrigates a large district which is rapidly developing into a profitable and happy agricultural community. Alfalfa finds in South Dakota a suitable soil and appropriate climatic conditions for its best production and harvesting. It is grown in large quantities on both sides of the river but its ultimate home is destined to be the western section of the State. Here this crop finds a natural and leading place in all agricultural calculations and has been found the most profitable plant that can be grown. Some farmers in this section of the State have sold \$100 worth of alfalfa seed per acre in a single season from their alfalfa fields. The statistics presented in this article show what agriculture means to the State of South Dakota and are worth the consideration of any one desirous of appreciating the opportunities this new State offers settlers and investors.

AGRICULTURAL STATISTICS.

(Information furnished 28 Aug. 1919. Department of History)

1. Agricultural land outside corporate limits, 1918.....	32,898,946 acres
2. Agricultural land within corporate limits, 1918.....	151,005 acres
Assessed value of item 1, 1918.....	\$980,049,605
Assessed value of item 2, 1918.....	7,137,292
Number of farms, shown by 1915 census.....	101,224
Acres in farms, 1915 census.....	23,820,436
1. Structures on item 1 above mentioned, 1918.....	80,792
Value.....	\$43,995,438
2. Structures on item 2 above mentioned, 1918.....	1,473
Value.....	\$2,087,794

PRODUCTIONS OF THE STATE FOR 1918 AND THEIR VALUE.

		Value
Corn.....	108,888,000 bu.	\$126,310,000
Wheat.....	71,305,000 bu.	142,610,000
Oats.....	75,816,000 bu.	42,456,000
Barley.....	33,099,000 bu.	24,456,000
Rye.....	4,000,000 bu.	5,000,000
Flaxseed.....	1,330,000 bu.	4,522,000
Potatoes.....	7,760,000 bu.	7,011,000
Hay.....	2,750,000 tons	40,500,000
Vegetables and fruits.....		10,000,000
Dairy products.....		12,500,000
Poultry products.....		12,500,000
Livestock (sold).....		124,401,000
Minerals.....		6,800,000
Pelts, wool and furs.....		3,500,000
Total value for 1918.....		\$562,495,000

The following table shows what South Dakota sold outside the State for year ending 30 June 1918:

	Value
Corn, 13,050,000 bushels.....	\$15,138,000
Wheat, 27,917,000 bushels.....	55,834,000
Oats, 32,845,000 bushels.....	18,433,000
Barley, 20,458,000 bushels.....	14,938,000
Rye, 3,245,000 bushels.....	4,478,000
Flax, 682,000 bushels.....	2,318,000
Horses, 37,860,000 pounds.....	3,786,000
Cattle, 579,432,000 pounds.....	56,784,000
Sheep, 21,550,000 pounds.....	2,047,000
Hogs, 376,737,000 pounds.....	61,784,000
Other products.....	35,000,000
Total for 1918.....	\$270,536,000

Stock Raising.—Stock raising from the first settlement of the State has been a prominent feature of agricultural enterprise. The vast reaches of prairie uplands bordering the rivers of the State are ideal pasture lands for both cattle and sheep, also horses range on these lands and are grown in profitable numbers. But cattle have from the early days of territorial times been the favorite animal to produce and market. Many large herds have been developed on prairie grass which grows in enormous quantities fitting cattle for the market without any grain supply whatever. Hogs are in recent years receiving more attention and render excellent returns for the care and feed they require.

LIVESTOCK STATISTICS, 1918.

Horses and mules, one year and under.....	101,817	\$2,861,758
Horses and mules, two to three years.....	102,776	4,611,143
Horses and mules, over three years.....	520,397	42,295,713
Stallions and jacks for service.....	4,462	1,073,362
Cows, all ages.....	773,039	42,661,077
Cattle, one year and under.....	652,794	18,439,403
Cattle, two to three years.....	489,926	21,728,168
Cattle, three years and over.....	141,890	9,134,632
Sheep, all ages.....	533,511	5,440,701
Hogs, all ages.....	738,109	11,952,753

Manufactures.—In 1914, measured by the value of products of its manufacturing industries — \$24,138,566 — South Dakota ranked 45th among the 48 States comprising continental United States, holding the same rank in respect to wage-earners, with an average of 3,788 engaged in such industries. In that year there were reported in operation 898 establishments, having an invested capital of \$15,059,583 and paying \$2,628,152 in wages to 3,788 wage-earners.

The cost of raw materials was \$17,079,357; the value of products \$24,138,566, leaving the value added by manufacture at \$7,059,209. The following table shows the relative importance and strength of the various industries in the State:

INDUSTRY	Number of establishments	Number of wage-earners	Value of products
Flour and grist mills.....	72	255	\$5,556,996
Butter.....	62	134	2,920,342
Printing and publishing.....	379	801	2,135,580
Bread and bakery products.....	88	255	1,256,121
Cars and shop construction.....	6	579	1,177,759
Lumber and timber.....	51	281	860,143
Confectionery.....	4	105	545,710
Tobacco and cigars.....	40	197	434,028
Gas.....	17	80	379,543
Liquors, malt.....	4	71	362,128
Mineral and soda waters.....	27	63	225,953
Marble and stone work.....	11	29	174,750
Foundry and machine shops.....	20	60	169,011
Copper, tin and sheet metal.....	5	24	162,749
All others.....	112	854	7,777,753

To this list may be added that of the packing-house industry. There are several of these in the State, the largest of which is located at Sioux Falls where there are more than a thousand persons engaged in that industry, one firm having a pay-roll of over \$60,000 per month. At Huron the farmers have erected a big packing-house. Canning factories are also being established in several sections of the State. One of the largest of these is a corn-canning plant just outside the city of Parkston in Hutchinson County. Here there is an enterprise producing canned corn to the extent of 15,000 to 20,000 cans per year, with a promise of larger production in the near future. The plant is operated but a few days each year when corn is prime for such a process, hence it does not give constant employment. It is, however, suggestive of the spirit and enterprise of the people in the State.

Mineral Resources.—These are gold, building stones, silver, clays and lead. Gold is the most valuable of these metals and was first discovered in the Black Hills by a soldier with Custer's troops in 1874. The richest deposits of gold are in Northwestern Hills and there is located one of the largest gold mines in the world. The Homestake at Lead yields half a million per month and is famous for its magnitude and scientific operation. South Dakota has large quantities of excellent building material and these rank second in value. The Dakota sandstone which outcrops about the edge of Black Hills makes handsome and durable building material. At Dell Rapids and Sioux Falls are large deposits of hard pink quartzite which also makes durable and beautiful buildings. Deposits of gypsum occur in the hills and quantities of chalk stone are found along the Missouri from Yankton to Chamberlain. This is nearly pure chalk and is suitable for manufacture of Portland cement. Materials for making brick are widely distributed over the State.

Gold produced in 1917 was.....	\$7,412,000 00
Silver produced in 1917 was.....	193,000 ounces
Finances: The total assessed valuation of all:	
Taxable property 1918 was.....	\$1,595,544,562 00
Total receipts for State in 1918 were.....	4,653,190 56
School fund invested in 1918 was.....	16,077,718 63
Bank deposits 30 Sept. 1918 were.....	206,496,073 89
Amount expended for public schools 1918 was.....	7,863,316 00
Total cost of maintaining State government 1918 was.....	4,001,144 50
Total State debt 20 Nov. 1918 was.....	332,136 00

Railway Mileage.—South Dakota has 4,832 miles of railway. Of this the Chicago, Milwaukee and Saint Paul and the Chicago and Northwestern own much the largest amount.

Education.—This important subject receives special consideration from the people of the State. When the State was admitted into the Union, Congress set apart the 16th and 36th section of every township for benefit of the public schools of the State. It also, by act of 18 Feb. 1881, specified that none of the Federal lands granted for educational purposes should be sold for less than \$10 per acre. This was a wise feature and was incorporated into the South Dakota constitution by those who formulated that important instrument. By observing this Federal requirement the school lands have been conserved until they have become valuable and some have been sold recently for more than \$100 per acre. The public school fund of the State has grown to large proportions and was at the close of the fiscal year 1917 \$9,268,235.17. The Federal lands granted by Congress to the State for educational, penal and benevolent institutions amounted to 500,000 acres. The different State educational institutions were given donations from this inheritance as they were established by the State legislature. For example, the State University was given 40,000 acres; the State agricultural College 40,000 acres, which with the 120,000 acres given to it direct by Congress, makes its land endowment 160,000 acres. From this source, rent of college land and interest on its endowment fund, the college now receives over \$30,000 a year income. The State normals at Madison and Spearfish each received 40,000 acres, and the other State schools as they were established were given a part of the public domain. The public school system is presided over by a State Superintendent of Public Instruction, elected by popular vote, whose department is composed of a staff of educational experts in charge of the various phases of public school activity. One man is supervisor of rural and consolidated schools, another is inspector of high schools, while others carry on the work of teacher examinations and certification. Very radical changes are now being made in the educational system of the State. Consolidation of rural schools is coming fast and means much to the present and future child of the State. School activities no longer consist only in mental gymnastics, but include skill in handwork and training for industrial careers as well as for college and the learned professions.

The following statistics and account of different State educational institutions will enable the reader to estimate somewhat intelligently what kind of education is offered the youth of the State and how the people view educational interests and results. There are

1 The Famous Hopestake Mine, at Lead City

2 The City of Deadwood

seven higher institutions of learning maintained by the people of the State. These are State University, State College of Agriculture and Mechanic Arts, State School of Mines and four normal schools.

The State University is located at Vermillion in the southern portion of the State, at the junction of the Vermillion with the Missouri River. The university has seven buildings; a faculty of 60 members and a student body in 1918 of over 600. The organization includes the College of Arts and Sciences, College of Law, College of Music, College of Medicine and College of Engineering.

The State College of Agriculture and Mechanic Arts is located at Brookings in the eastern part of the State only 17 miles from the Minnesota border. The institution has some well defined lines of work assigned to it as follows: research and special scientific investigation; instruction along special lines; agricultural extension to include farm and home demonstrations. The work of the institution is carried on in the 10 buildings on the college campus and the large college farm connected with the college also at the several sub-stations operated from the college. These are located as follows: Highmore, Eureka, Cottonwood and Vivian. In 1917 there were 620 students enrolled and a faculty of 75 instructors.

The State School of Mines is located at Rapid City in the western part of the State. There are four buildings on this campus and the legislature in 1919 appropriated \$100,000 for a fifth one.

The four normal schools are located as follows: Spearfish Normal in northwest section of the State, Lawrence County; Aberdeen Normal in Brown County, north section of the State; Madison Normal in Lake County, the eastern part of the State, and Springfield Normal in Bon Homme County, the southeast section of the State. These four normals and the three higher educational institutions of the State are all under one board of management. This board is made up of five men appointed by the governor and confirmed by the senate. Their term of office is six years.

In addition to these higher educational institutions supported by taxation, there are a number of denominational institutions, which are growing in favor and influence. Among these are the following: Dakota Wesleyan University at Mitchell, maintained by the Methodist Church. This institution had, 1918, 225 students and 25 members in the faculty. Huron College, Huron, is maintained by the Presbyterian Church, and reported 107 students in 1918 with 22 members of the faculty. Yankton College at Yankton is supported by the Congregational Church. It reported 133 students in 1918, with 25 members in the faculty. Sioux Falls College at Sioux Falls is supported by the Baptists. It reported an enrolment of 100 students with 12 members in the faculty. The Catholics of the State support a number of schools; also Notre Dame Academy at Mitchell and Presentation Academy at Aberdeen. The Norwegian Lutherans have a Normal School and College at Sioux Falls and also at Canton.

The following educational statistics may serve to further reveal the educational activity of the people in this new State:

Consolidated schools:	
Enrolment below high school	3,623
Enrolment in high school	782
Independent districts — cities and towns:	
Enrolment below high school	35,046
Enrolment in high school	10,177
Rural districts:	
Enrolment below high school	86,752
Enrolment in high school	2,096
Number of school houses in 1918:	
Consolidated districts	56
Non-accredited high schools	96
Schools not reporting	27
Total	216
Teachers employed, 1919:	
Male	805
Female	6,635
Average monthly salary:	
Male	\$102.39
Female	68.50
School expenditures, 1918:	
Rural districts	\$4,231,177.22
Independent districts	3,180,765.86
Consolidated districts	451,373.72
Total	\$7,863,316.80

The legislative appropriations of 1917, for period of 1917 to 1919, were \$1,246,600 general, for higher institutions; \$707,570 special, for higher institutions. Out of the two items the Agricultural College received \$312,000 from the general fund, and \$243,000, special, and the experiment stations received \$8,000.

The census of 1915 gives 3,134 illiterates, or 72 per cent of the population.

Penal and Charitable Institutions.—These are the State Penitentiary, located at Sioux Falls; the State Insane Hospital, located at Yankton; the State Reform School, located at Plankinton; the School for the Deaf at Sioux Falls, and the School for the Blind at Gary; also the School for Feeble Minded at Redfield. All these are under the Board of Charities and Corrections, composed of three men appointed by the governor and confirmed by the senate.

Religion.—Religious liberty is fully enjoyed by the people of South Dakota, and is guaranteed to them by a specific section in the State constitution. Nearly all sects and creeds are represented in the religious organizations of the State, and none are prevented from following that form of worship they deem most important and helpful.

War Activities.—The people of South Dakota responded promptly and liberally to every demand made upon her for support of the war.

Early History — Exploration, Settlement and Development.—When in 1803 France ceded to the United States her possessions in the Northwest, the Territory of North and South Dakota was an unknown and trackless

wilderness inhabited only by wild beasts and savage Indians. A few adventurers such as LeSueur, Trudeau and Loisel had traversed this land to some extent in their traffic with the Indians and in some instances attempted settlement, but these were soon abandoned. All this region was marked on the maps of those days an "unexplored" country. In 1804 Lewis and Clark visited the Territory. Their records show that in August of that year (1804) they camped for three days at Yankton where the Yankton or James River empties into the Missouri. From there they went up the Missouri, exploring that river through the entire Territory of Dakota, then up the Yellowstone and on to the Pacific. The first white settlement of record in the State was made on 11 Nov. 1794 in what is now Charles Mix County, by J. B. Trudeau, but this did not become permanent, neither did the settlement on the Missouri River at Big Bend made in 1797 by Registre Loisel. Fort Pierre was settled in 1817 by Joseph LaFramboise and has remained to this day.

The American Fur Company made incursions into the Territory as early as 1811. In June 1831 a steamboat built by this fur company found its way to Fort Pierre. This was the first steamboat to navigate the upper Missouri and was named the *Yellowstone*. This greatly accelerated fur trading and other commercial relations with the Indians. The *Yellowstone* made another trip up the Missouri through South Dakota in 1832 and this time went as far north as the mouth of the Yellowstone River. Among its passengers on this trip was George Catlin, the famous painter and ethnologist. Mr. Catlin spent some time at Fort Pierre during the summer of 1832, studying the Indian in his primitive life, and again visited the State in 1836, while inspecting the work of the Indians at Pipestone quarry in Western Minnesota. In 1838 Gen. John C. Fremont, the noted pathfinder, explored the eastern portion of the State, taking levels of prominent points and discovering and naming many lakes. The next year (1839) he again visited the State, going by steamboat to Fort Pierre and from there Northeast to Devils Lake, N. D. He was accompanied this time by Joseph N. Nicolle, geographer and astronomer. By 1840 the activity of the American Fur Company had decreased the buffalo herds and fur-bearing animals of the Dakota Territory, and the fur industry was fast losing its importance in this region. Ten or 12 years more, or by 1855, the fur trade of Dakota was about over and the great buffalo herds of the plains had nearly disappeared. Fort Pierre was sold that year by the American Fur Company to the United States government and thereafter became a military post. Between the Fort Pierre settlement in 1817 and that of Sioux Falls in 1858 there seems to have been little attention given to the fertile prairies of this great Territory. The settlement at Sioux Falls in 1856 opened the way for rapid and permanent occupation of the rich bottomlands of the Big Sioux River. The next year (1857) the Minnesota legislature chartered the Dakota Land Company, and from that on settlements were made at various places on the eastern side of the State and along the Missouri River.

A territorial government was provided by Congress in 1861, after a long controversy between citizens of the Territory and Congressional representatives from Minnesota, the latter claiming that Dakota belonged to and was a part of the Minnesota Territory. Indian warfare interfered very seriously with the settlement and development of this new land for a number of years. By 1862 there were many settlers established along the Missouri and the Sioux rivers. During harvest season that year (1862) the Santee Sioux on the Minnesota River took to the warpath and massacred white settlers wherever they could find them. Near Sioux Falls these blood-thirsty savages attacked and killed Judge Joseph Amidon and his son in the hayfield. This caused terror in the hearts of nearby settlers who left their stock and crop and fled for their lives. At this time the Indians destroyed many homes and large numbers of stock, also grain in abundance just ready for the harvest. Another outbreak occurred in 1865 when much property was again destroyed and some settlers killed. In 1869 a treaty was signed between the Indians of Dakota Plains and the Federal authorities, but this did not last many years. By June 1876 further outbreaks occurred and the government sent a large force of Federal troops under General Custer to quell the outbreak, but this brave general with some 300 of his men, were killed before peace could be arranged with the Indians. This, however, was about the last of Indian warfare and after that date settlers suffered but little from attacks by Indians.

Government.—South Dakota became a State in 1889. The enabling act was the Federal omnibus bill which admitted into the Union North and South Dakota, Montana and Washington. The constitution which was then adopted by the people of South Dakota is regarded as one of the most stable and comprehensive in the United States. As originally adopted it comprised 26 articles which embraced a wide range of subjects pertaining to the rights of citizens and the proper control of State affairs. The usual form of *three* departments, the legislative, executive and judicial, is employed, with the governor authorized to veto such legislation as he may find undesirable. This right, however, is seldom exercised. The legislative power was vested in a senate of 45 members and a house of representatives of 124 members. These may be increased from time to time by legislative enactment. The legislature convenes every two years on the first Tuesday of January and must adjourn at the end of 60 days not including Sundays. Members of the legislature get no salary for their services, but are allowed a per diem of five dollars during time the legislature is in session and mileage to and from their homes. There is a Supreme Court of five judges elected by the people, who hold office for six years, and may and do succeed themselves when re-elected by the people at the general biennial election. There are also district judges elected by the people and county judges to deal with probate business of their locality. The constitution was amended in 1918 to give the ballot to all citizens of the State 21 years of age or over, and to those fully naturalized. This right can be exercised only after residence in the United States five years, of the State one year, the

county 90 days, and the election precinct 30 days. Bone dry prohibition is in force in the State and was obtained by an amendment to the State constitution. This constitution provides for exercise of the Initiative and Referendum. Both are used by the people, but chiefly that of referring important laws to the people for their approval or rejection at the time of the general election. The primary election method of selecting officers is in force and a very general interest is shown in that public function. The people of South Dakota are as a whole patriotic and loyal both to State and national interests. This is indicated by their response to calls for service during the World War.

State Capitol.—The State capitol is at Pierre, on the Missouri River, near the geographic centre of the State. The building is completely fireproof. Foundations are of fieldstone, the first story of Raindrop sandstone and the superstructure of Bedford limestone. The interior is of brick and reinforced concrete. Dimensions are 287 feet long, 145 feet wide, 165 feet from ground floor to top of lantern on dome. There are four floors. The interior finish is in marble, oak and birch. Decorations are simple but impressive. There are nine large mural paintings, among which is Blashfield's most important creation. The style, furniture, decorations and finish of the building show excellent taste and artistic good sense.

GOVERNORS OF SOUTH DAKOTA.

Arthur C. Mellette.....	Republican.....	1889-93
Charles H. Sheldon.....	".....	1893-97
Andrew E. Lee.....	Populist.....	1897-1901
Charles N. Herreid.....	Republican.....	1901-05

Hyde.....	2,685	Unorganized.....	2,403
Jackson.....	2,077		

Some of the larger cities of the State are the following with their populations as given in the 1915 State census: Sioux Falls, 20,929; Aberdeen, 11,846; Watertown, 8,313; Lead, 8,128; Mitchell, 7,785; Yankton, 4,771; Rapid City, 4,268; Madison, 3,949; Brookings, 3,416; Deadwood, 3,113. Nearly all these cities have increased in population by 20 or 30 per cent since 1915. For example, Sioux Falls claims a population now (1919) of over 25,000; Aberdeen of 15,000, etc.

J. W. HESTON,
*President of the State Normal School, Madison,
S. D.*

SOUTH DAKOTA, University of, the State university located at Vermilion. The first territorial legislature of Dakota located the University of Dakota at Vermilion in 1862; nothing further was done toward establishing the institution until 1881, when Congress granted 86,000 acres to Dakota for a university when the Territory should be admitted to the Union as a State; the citizens of Vermilion then erected a building and organized an academic department. This action was ratified by the legislature in 1883, the building accepted as a gift to the Territory and the university incorporated. The first classes were opened in 1883. In 1891 the name was changed to University of South Dakota. The university is composed of the colleges of arts and sciences, law, music, medicine and engineering. The university admits women on equal terms with men. The government is by a board of five regents appointed by the governor and confirmed by the senate for a term of six years. The State geological survey is conducted in connection with the university, as is the State Health Laboratory. The offices and laboratories of the Food and Drug Commission are also located at the university. The income of the university is derived mostly from the Congressional land grant of 86,000 acres of which it now has control, and from State appropriations; tuition fees are small; the income in 1914-15 amounted to \$220,000. The library in 1916 contained 32,000 volumes, the students numbered 683 and the faculty 60.

SOUTH DAKOTA AGRICULTURAL COLLEGE, the State school of agriculture and technology, situated at Brookings, S. Dak. It was first opened in 1884, and is under the control of the same board of regents as the University of South Dakota (q.v.). It is co-educational. Courses are offered in animal-husbandry, agronomy, horticulture, veterinary science, dairying, mechanical, electrical and civil engineering, architecture, domestic science, pharmacy and general science; in addition to these technical and scientific courses there is a normal course, a business course and a preparatory department. Military drill is also a part of the curriculum. Formerly two courses in agriculture were offered; now there are several groups under the general heading of agriculture; this course requires work in one language, and includes certain practical studies not before offered, such as stock judging, blacksmithing, horseshoeing, etc. The degree of B.S. is conferred. The college farm and grounds contain 400 acres; in 1901 a new physics and engineering building and a plant breeding building were erected. The income is

derived mostly from State appropriations and from the annual Federal appropriation in accordance with the law of 1890. The State agricultural experiment station, which is connected with the college, receives a separate Federal appropriation.

SOUTH DAKOTA STATE SCHOOL OF MINES located at Rapid City near the famous gold mining region of the Black Hills. Established 1885. Offers courses in mining engineering, metallurgical engineering, civil engineering, electrical engineering. Well-equipped laboratories and a library of more than 6,000 volumes, chiefly technical. The institution is under control of the State Regents of Education. Its income is derived almost wholly from State appropriations, the tuition fee being only \$12 a year.

SOUTH GEORGIA ISLANDS. See GEORGIA, SOUTH.

SOUTH HADLEY, Mass, town, Hampshire County, on the Connecticut River, and on the Boston and Maine and the New York, New Haven and Hartford railroads, 14 miles north of Springfield. The town includes the two villages of South Hadley and South Hadley Falls. It was first settled in 1726-27, was originally a part of the town of Hadley and was separately incorporated in 1753. The river here has a fall of 40 feet that affords power for manufacturing; the first paper mill was established in 1848; the town now contains paper mills, woolen and cotton mills and saw mills. There is a public library, and a public high school; the town is also the seat of Mount Holyoke College (q.v.). Pop. 4,894.

SOUTH HAVEN, Mich., city in Van Buren County, on Lake Michigan, 52 miles southwest of Grand Rapids, and on the Michigan Central and the Kalamazoo, Lake Shore and Chicago railroads. It has an excellent harbor and is a shipping point for fruit. It is patronized as a summer resort, has a fine beach and other attractions. The surrounding country is largely devoted to fruit raising. Manufactures include lumber, crates, flour, canned goods, pianos and pipe organs. It was settled in 1833 and received its city charter in 1902. Pop. 3,577.

SOUTH HOLLAND. See NETHERLANDS.

SOUTH ISLAND. See NEW ZEALAND.

SOUTH KENSINGTON MUSEUM, an institution in London originated by the Prince Consort in 1852, and under the direction of the Committee of Council of Education. It contains a rare collection of ancient and modern art as applied to manufactures, a gallery of British art, an extensive collection of water-color paintings, a collection of sculpture, reproductions of ancient sculptures, Raphael's cartoons and an art library. Other departments contain collections of substances used for food, and of materials employed in building and construction. The loan department is a special feature in connection with the institution. There is also a national art training school and schools of science and cookery. In 1899 the name became officially the Victoria and Albert Museum. The present buildings were erected in 1899, and completed and opened in 1909. Catalogues of its collections are available.

SOUTH KENSINGTON, National Art Schools of, London, England, connected with the Victoria and Albert, or (colloquially) South Kensington Museum, in Brompton, south of Hyde Park, are under the direction of the Department of Science and Art. Their special purpose is to study the application of art to industry. They have the advantage of admission to the priceless collections of all kinds in the museum, which are carefully arranged for purposes of instruction. See LONDON.

SOUTH KINGSTOWN, R. I., town, Washington County, on the southeastern coast, and on the New York, New Haven and Hartford Railroad. The town of Kingstown was settled and incorporated as early as 1674; it was divided into North Kingstown and South Kingstown in 1723. The colonial assembly met at South Kingstown at various times, and in 1790 the convention called to decide on accepting the United States Constitution met here, but voted to adjourn to Newport. In 1780 South Kingstown was one of the wealthiest towns in the State. The industries include cotton mills and machine shops. Fishing and farming are extensively carried on in the district. Pop. (1910) 5,176.

SOUTH MILLS, Battle of. In the fore part of April, 1862, after the capture of Roanoke Island and Newbern, rumors reached General Burnside at the later place that the Confederates were building iron-clad gunboats at Norfolk, Va., with the intention of running them through the Dismal Swamp Canal and Roanoke River to make a descent upon the Union flotilla in Albemarle and Pamlico sounds. Burnside, in co-operation with Commander Rowan of the navy, organized an expedition to move on South Mills, near Camden, destroy the locks of the canal at that point, and the Currituck Canal by blowing up its banks, thus rendering it impossible for the gunboats to come into the sounds. Another object of the movement was to create the impression that the entire Burnside expedition was moving on Norfolk, less than 40 miles distant. The expedition was put under command of Gen. J. L. Reno, who, with the 21st Massachusetts and 51st Pennsylvania, sailed from Newbern to Roanoke, where on 18 April he was joined by Colonel Hawkins' brigade (9th and 89th New York and 6th New Hampshire) with four guns. In all, Reno had about 3,200 men. The transports, accompanied by gunboats, sailed up the Pasquotank River, and about midnight of the 18th Hawkins' brigade began a landing on the east side some four miles below Elizabeth City, which is on the west side. At 3 A.M. of the 19th Hawkins' brigade had been landed and was ordered forward, Reno remaining to bring up the other two regiments, which had been delayed by the grounding of some of the transports. Hawkins, misled by a guide, had marched by a circuitous route, and was overtaken by Reno, some 12 miles out, and Reno took the advance, Hawkins' fatigued brigade following. After marching about four miles, and when within two miles of South Mills, Reno's advance came under an unexpected fire of artillery and was brought to a halt. Reno pushed his guns into action. Col. A. R. Wright, of the 3d Georgia, 585 strong, some drafted North Carolina militia, a company of

local cavalry, in all about 750 men and four guns, had taken position across the road. His artillery commanded the road, was supported by infantry in a deep ditch, along which rails were piled, with open ground in front and a dense wood in rear. Skirmishers covered both flanks, which were in the woods. After an artillery duel of an hour Reno ordered the 51st Pennsylvania and then the 21st Massachusetts through the woods on the right to turn the Confederate left, and Hawkins, having come up, was ordered, with the 9th and 89th New York, to follow the two flanking regiments to the right, the 6th New Hampshire being placed on the left of the road to support the artillery. The 51st Pennsylvania and 21st Massachusetts, reaching the Confederate left, opened fire and about the same time the 9th New York, breaking from the woods, made a gallant charge—Reno says an "unauthorized and unnecessary" one—over the open ground upon the Confederate guns, and being met with a severe fire of canister and musketry, was repulsed, but made a quick rally on the 89th New York, and both went forward to join the 21st Massachusetts, which, with the 51st Pennsylvania, had kept up fire, forcing the Confederates to withdraw their guns and retire a mile, upon support that was coming up. On the left of the road the 6th New Hampshire had made a gradual advance to within 200 yards of the right of the 3d Georgia and, pouring in a volley, hastened its retreat. The fight lasted nearly four hours. At 10 p.m. without accomplishing the principal object of his expedition, Reno marched back to his boats, and the troops returned to their stations on Roanoke Island and Newbern. The Union loss was 13 killed, 101 wounded and 13 missing, an aggregate of 127, of which 75 were lost by the 9th New York. The Confederate loss was six killed, 19 wounded and three missing. Consult 'Official Records' (Vol. IX); The Century Company's 'Battles and Leaders of the Civil War' (Vol. I).

SOUTH MILWAUKEE, Wis., city in Milwaukee County, eight miles from the heart of Milwaukee, on the Chicago and Northwestern Railroad. It has a high school and a public library. Manufactures include steam shovels, dredges and wreckers, stoves, rakes, chains, baskets and woolen shawls. It received its city charter in 1896. Pop. about 6,092.

SOUTH MOUNTAIN, Battles of. When General Lee led the Confederate army across the Potomac into Maryland (5 Sept. 1862), east of the Blue Ridge, he expected that the Union troops holding Winchester, Martinsburg and Harper's Ferry would be withdrawn, thus opening his line of communication through the Shenandoah Valley. Upon his arrival at Frederick, much to his surprise he found that this had not been done; and as an uninterrupted line of communication through the valley was an absolute necessity for his intended campaign into Pennsylvania, prompt measures were taken to secure it. On the morning of the 10th, Jackson with 14 brigades marched from Frederick, passed over South Mountain at Turner's Gap, crossed the Potomac at Williamsport, on the 11th, drove the Union garrison at Martinsburg into Harper's Ferry, and proceeded to invest that place from the Virginia side of the Potomac. McLaws, with 10 brigades, crossed the

South Mountain at Brownsville Gap, and seizing Maryland Heights, invested Harper's Ferry from the Maryland side. Walker's division crossed the Potomac at Point of Rocks and seized Loudoun Heights. (See **HARPER'S FERRY**; **MARYLAND CAMPAIGN OF SEPTEMBER 1862**). Lee followed Jackson through Turner's Gap; D. H. Hill's division was left at Boonsboro, to support Stuart's cavalry, which was to hold Turner's Gap and watch McClellan; and with the divisions of D. R. Jones and J. B. Hood, and the reserve artillery, all of Longstreet's command, Lee marched to near Hagerstown to await the result of the movement on Harper's Ferry, and the subsequent concentration of his widely dispersed command for the movement into Pennsylvania.

The advance of McClellan's army reached Frederick on the 12th. Before noon next day there was found in the abandoned Confederate camp the order, known as "Order 191," for the movements of Lee's army for the 10th. The copy was from Lee to D. H. Hill and showed the position of every division of Lee's army, and what it was expected to do, that at the time Jackson, McLaws and Walker were investing Harper's Ferry, and that Lee, with Longstreet and D. H. Hill, was beyond Turner's Gap. It was not later than noon when McClellan had this valuable paper placed in his hands, but he did not act promptly upon it. It was not until 3 p.m. that he ordered Pleasonton, then near Middletown, to ascertain whether the Confederates had moved in the direction indicated in the order. At 3.35 p.m. Cox's division of the Ninth corps was ordered to march from Frederick to Middletown and support Pleasonton's cavalry in a reconnaissance to Turner's Gap. Pleasonton advanced toward Turner's Gap and found his progress checked by Stuart's cavalry. It was late in the day when McClellan had come to the decision to relieve the garrison at Harper's Ferry, and at the same time fall upon and destroy Lee's isolated command at Boonsboro. Franklin's Sixth corps and Couch's division were to move through Crampton's Gap of South Mountain, break the line of investment that McLaws had thrown across Maryland Heights and the foot of Pleasant Valley, thus relieving Miles at Harper's Ferry, and at the same time interpose between McLaws and that part of Lee's army at Boonsboro and Hagerstown. At the same time Burnside, with the First and Ninth corps, supported by the rest of the army, was to move through Turner's Gap and fall upon Lee, who it was thought had Longstreet and D. H. Hill at Boonsboro. It would have been well had these orders been given early in the afternoon of the 13th and the troops immediately put in motion for the passes of the mountain, but it was not so. The orders were to move next morning; meanwhile Pleasonton was to fire occasionally a few artillery shots, even though no enemy appeared in front, so that Colonel Miles, at Harper's Ferry, would know that the Union army was near.

Battle of Crampton's Gap.—General Franklin who was at Buckeystown, six miles from Frederick, and between it and the Potomac, marched at 6 a.m. by way of Jefferson, where he halted an hour for Couch's division to join him from Licksville, but Couch not coming up, he resumed the march and at noon halted two

miles short of Burkittsville, which lay half a mile from the foot of Crampton's Gap. The gap was thought to be strongly held and Franklin made elaborate preparations to carry it. In fact the gap was held by two small cavalry regiments, part of Mahone's brigade of infantry and two batteries, in all about 900 men, under Col. T. T. Munford. Semmes' brigade, with five guns, held Brownsville Gap, one mile south of Crampton's and 300 of Semmes' men closely supported Munford's right; so, to meet the attack of Franklin's column of nearly 12,000 men, Munford had 1,200 infantry and dismounted cavalry posted behind stone fences and houses at the east foot of the gap, with eight guns in position on the winding road about half way up the mountain. It was determined that the position should be carried by assault, General Slocum's division advancing on the right of the road leading through the gap to make the assault, supported by two brigades of General Smith's division moving on the left of the road. It was 3 o'clock before Slocum's division had been formed, in two lines, Bartlett's brigade on the right, Newton's in centre and Torbett's New Jersey brigade on the left. The day was well spent when the order was given to advance and the skirmishers pushing forward drew the fire of the Confederates posted behind the stone fences and houses; which, with the fire from the artillery on the mountain side was so severe, that the advance was suspended until artillery could be brought up to silence that of the Confederates and batter down the stone fences. The artillery was slow in coming up, Smith had not advanced on the left, the men were becoming restive under the hot fire being poured upon them and without waiting for the artillery to come up or Smith to close up on the left, the three brigade commanders after a hurried consultation and without orders from corps or division commander, ordered a charge, which was gallantly made. The fire poured upon the line was severe and some of the regiments were momentarily shaken, but the stone fences were carried and the Confederates driven up the steep hill, the Union line, much broken, closely following. When nearing the crest of the hill, Cobb's Georgia brigade, which had just come up to support Munford, was encountered in the gap, instantly routed, most of it captured and the Union troops pursued the retreating Confederates to the west foot of South Mountain, when darkness halted them. The Union loss was 113 killed, 418 wounded and 2 missing. The Confederate loss was 70 killed, 289 wounded and 603 captured or missing. In addition they lost four colors, one gun and 700 small arms.

Battle of Turner's Gap.—While Franklin was forcing Crampton's Gap, Burnside, with the First and Ninth corps was severely engaged at Turner's Gap, six miles northeast of Crampton's. The engagement was most severe at and south of Fox's Gap, a mile or more south of Turner's, and there was a fierce contest north, but as both was for the possession of the main road, which ran through Turner's Gap, this has given the Union name to the battle—the Confederates call it the battle of Boonsboro. On the night of the 13th Pleasonton, failing to get infantry support, bivouacked in the valley, near the foot of Turner's Gap, and

early in the morning pressed his reconnaissance and soon ascertained that the Confederates were in some force in the Gap. Two batteries of artillery were brought up, and opened fire upon Confederate artillery well up in the Gap; and Cox, whose division had bivouacked near Middletown, advanced a short distance on the main road, and then with two brigades marched to the left on the old Sharpsburg road to reach the flank of the Confederate position. As he approached Fox's Gap, one mile south of Turner's, he received artillery fire. D. H. Hill, whose five brigades had been halted near Boonsboro, three miles west of Turner's Gap, when informed by Stuart that Pleasonton was advancing, on the 13th sent two brigades and two batteries back to assist Stuart in checking him. At midnight he received an order from Lee to go in person next morning and assist Stuart. When Hill arrived at the gap before sunrise Stuart had gone to Crampton's Gap and Maryland Heights, leaving Garland's and Colquitt's brigades of Hill's command to defend the gap. It was not long before Hill became aware that Cox was marching on the road to Fox's Gap, held by Colonel Rosser with a regiment of cavalry and two guns. Garland's brigade was sent to Fox's Gap, Colquitt's retained at Turner's, and Anderson's ordered up from Boonsboro. Garland has not been long in position before Cox appeared and attacked him; and after a severe fight, in which Garland was killed and Lieut.-Col. R. B. Hayes of the 23d Ohio wounded, Garland's brigade was routed, and Cox gained the crest of the mountain, just south of Fox's Gap, but could not seize the gap, for at the moment of his victory G. B. Anderson's brigade came up and formed in front and on his right, covering the road through the gap. Learning from prisoners taken that D. H. Hill, with five brigades, was in his front, and that Lee was hastening from Hagerstown, with Longstreet's command, Cox withdrew his advance parties from the woods into which they had charged, and forming line just under the crest of the ridge, awaited reinforcements. The first reinforcement was Willcox's division, which came at 2 p. m. and, forming on Cox's right covered the road through Fox's Gap. Meanwhile other Confederate troops had come up and were coming up to form in Cox's front. Hill had called Ripley's and Rodes' brigades from Boonsboro, and thrown Ripley in front of Cox, and Rhodes to a hill north of Turner's Gap. General Lee, leaving Toombs' brigade near Hagerstown, marched back from there with the brigades of G. T. Anderson, Drayton, Kemper, Garnett, Jenkins, Evans and two brigades of Hood's division. After a hot and dusty march of 13 miles, Anderson and Drayton, first arriving, reached the field at 3 p. m., and were sent to support Hill's troops at Fox's Gap, and Drayton, on the left of the line thus formed, advancing from the woods at the gap, was encountered by Willcox, defeated and driven from the field with great loss, more than half of his brigade being killed, wounded and captured. Heavy skirmishing followed all along the line, Sturgis's division came up and partly relieved Willcox, and near sunset General Reno came up, with Rodman's division, one of whose brigades, with a battery, was sent to

Cox's extreme left, the other held on the right. Reno rode forward to reconnoiter just to the right of the gap, as Hood's division came up on the Confederate left; there was a scattering fire on both sides; and Reno, commanding the Ninth corps, was killed. At about the same time the right of the Confederate line charged upon the left of Cox's line, held by Fairchild's brigade and Clark's battery, and their quick repulse ended the engagement at Fox's Gap, with the Confederates still holding the gap. The loss of the Ninth corps in this engagement, which continued from 9 A. M. until after sunset, was 157 killed, 691 wounded and 41 missing. The Confederate loss in Cox's front was about 600 killed and wounded and as many more captured.
